Several grassland restoration and enhancement techniques will increase the amount and quality of movement habitat for San Joaquin kit fox. In general, managing nonnative vegetation and overtime increasing the amount of native vegetation in the ecosystem will have a positive effect on grassland ecosystem function. In turn this will benefit predators like the San Joaquin kit fox by supporting a more sustainable prey population. The Implementing Entity will introduce livestock grazing where it is not currently used, and where conflicts with covered activities will be minimized, to reduce vegetative cover and biomass that currently excludes ground squirrels facilitate colonization of new areas by ground squirrels within the Reserve System (GRASS-6). Specific grassland conservation and management goals, objectives, and actions are discussed above (Section 5.3.3 *Grassland Conservation and Management*).

## Management Techniques and Tools

Several specific actions will be taken by the Implementing Entity to improve passage for San Joaquin kit fox. At locations indicated by pre-acquisition assessments and targeted studies and informed by the monitoring and adaptive management program, the Implementing Entity in coordination with the road operator will remove fences, replace culvert, and install free span bridges to allow wildlife to move freely under and over roadways (LM-1, LM-2, LM-3). To increase the probability that wildlife will use these crossings fencing or other features will be installed that will direct wildlife attempting to cross the roadway towards the culvert or other safe crossing (LM-4). Further, road operators will be required to remove or perforate median barriers, where allowable and safe, to improve successful wildlife crossings and, as indicated by targeted studies and informed by the monitoring and adaptive management program, install fencing or other features to direct wildlife to those open sections (LM-5).

To ensure that California ground squirrels and other rodents are as abundant as possible within the Reserve System the Implementing Entity will cease the use of rodenticides within the Reserve System except when necessary to maintain structures (e.g., levees, roads, stock pond dams) or to prevent nuisance populations (as defined in the Fish and Game Code Sections 4150 and 4152) from moving onto adjacent private lands (GRASS-5). Further, the Implementing Entity in coordination with road operators will remove fences and roads where they are no longer needed and to increase landscape permeability for wildlife movement (LM-1). Road removal may include road removal and decommission (i.e., returned to a natural condition) or road stabilization and abandonment to reduce hazards to wildlife and to reduce the erosion potential associated with dirt and gravel roads. This will allow many native species, including San Joaquin kit fox, to move more freely within the Reserve System.

In addition to protecting and restoring modeled habitat and improving structures the Implementing Entity will conduct a public education campaign in the southeastern portion of the study area to provide landowners with information about management and land use techniques that are more compatible with movement and use by San Joaquin kit fox (GRASS-10).

## Uncertainties and Threats

The level to which San Joaquin kit fox uses the study area for movement, foraging, or denning is uncertain. San Joaquin kit fox have been documented moving through the lowlands just east of the study area and it is likely that individuals occasionally move into Santa Clara County. Also it will be difficult to monitor and measure the effectiveness of crossings structures. Other wildlife species (e.g., coyote, bobcat) will likely be used as surrogate species to determine whether these crossing structure adequately facilitating movement, since San Joaquin kit fox occur at such low numbers.

### 5.4.10 Tiburon Indian Paintbrush

There are a total nine known occurrences of Tiburon Indian paintbrush throughout its range. There are two occurrences in the study area. Population estimates for this species exist for all except one of the occurrences (see Chapter 4, Section 4.6.8 *Serpentine Plants* for population estimates). In the study area, one occurrence is located on a mitigation site, under a temporary easement, for creation of the Kirby Canyon Landfill. The second occurrence, located in the North Canyon, is privately owned. At the time this Plan was being developed, the landfill operator was in the process of finalizing a conservation easement as compensation for the recent expansion of the landfill. Impacts from management activities to the one occurrence currently under temporary easement, consistent with the conservation strategy of the Plan, are the only impacts allowed to the species in the permit area. These impacts will be temporary in nature and will result in overall benefits to the occurrence. This Plan does not cover impacts to additional occurrences of Tiburon Indian paintbrush that may be discovered during the permit term (**Tables 4-6 and 5-16**).

## Biological Goals and Objectives

The Implementing Entity will protect, maintain the viability of, and enhance Tiburon Indian paintbrush by acquiring the occurrence currently under a temporary easement at the Kirby Canyon Landfill, and by increasing the size of the occurrence within the permit area to at least 2,000 individuals (**Table 5-16**).

Tiburon Indian paintbrush is expected to benefit from acquisition and enhancement of grassland natural communities that serve as primary habitat and/or provide suitable habitat for occurrence expansion (see Section 5.3.3 *Grassland Conservation and Management*).

## Occurrence Acquisition

The two known occurrences of Tiburon Indian paintbrush in the study area will be permanently protected upon successful implementation of the Plan. The

North Canyon occurrence is anticipated to be permanently protected with a conservation easement by the landfill operator prior to the finalization of this Plan and permit issuance. The Implementing Entity will acquire the other occurrence of Tiburon Indian paintbrush, which is under a temporary easement to mitigate effects of Kirby Canyon Landfill. Although the current easement expires in 2034, the Implementing Entity may permanently protect this occurrence at any time before Year 45 of the permit term.

In order for an occurrence to count as protected under the Plan, there will be a buffer of at least 500 feet between the occurrence and adverse land uses. Adverse land uses include permanent land uses that could endanger the long-term viability of the occurrence; including urban development, landfill, and other intensive land uses. This buffer may be reduced or increased in specific circumstances where, based on documented site conditions, plant occurrences are protected from adverse land uses by another means or site conditions warrant a larger buffer. For example, if a major physical barrier separates the occurrence from the land use or the occurrence is located upslope from the adverse land use, the buffer may be reduced. Conversely, if there are certain adverse land uses upslope from the occurrence and effects to the occurrence are expected, a buffer greater than 500 feet may be needed. A 500-foot buffer was recommended in the *Recovery Plan for Serpentine Soil Species of the San Francisco Bay Area* (U.S. Fish and Wildlife Service 1998c).

## Management Techniques and Tools

The one occurrence protected under this Plan will be increased to or maintained at least 2,000 individuals in order to ensure the yearly viability of the occurrences (U.S. Fish and Wildlife Service 1998c). In order to successfully manage the Reserve System's occurrence of Tiburon Indian paintbrush, targeted studies will be conducted to identify factors limiting the expansion of the occurrence (STUDIES-5). These studies may focus on various factors related to management and microsite needs of the species at all life stages from germination through maturity (STUDIES-5). Additional studies to determine the effects of livestock grazing on Tiburon Indian paintbrush will exclude livestock and monitor the effects on occurrences; control sites will be incorporated into these studies (STUDIES-16), unless the Implementing Entity demonstrates that the required action is biologically inappropriate. Results of all research studies will be incorporated into reserve unit management plans to mitigate or remove the limiting factors.

To help implement the Recovery Plan for this species (U.S. Fish and Wildlife Service 1998c), a permanent conservation seed bank for the Tiburon Indian paintbrush will be established. To assist the long-term viability of this species, a permanent conservation seed bank for Tiburon Indian paintbrush will be established in the National Collection of Endangered Plants operated by the Center for Plant Conservation as a national repository of endangered plant seed stock. Seeds will be deposited at a local custodial institution (e.g., a botanic garden) designated by the Center for Plant Conservation. A permanent conservation seed bank provides long-term storage in an accredited facility of a

representative sample of seeds from wild occurrences. All known occurrences in the Reserve System will be represented in the conservation seed bank unless collection would pose a threat to the occurrence's continued existence. Occurrences will be maintained in the seed bank separately to ensure the genetic diversity of the bank. The seed bank will be replenished as necessary to maintain the genetic integrity of the stock. The conservation seed bank will serve as a repository of the species to guard against extinction of the species from chance catastrophic events and to provide potential material for enhancement efforts in existing occurrences, repatriations, or introductions to new sites (STUDIES-14).

## Uncertainties and Threats

There is still much to learn regarding the management of Tiburon Indian paintbrush. Because management and conservation decisions for this species are limited in their potential efficacy, the Implementing Entity has little information with which to design and plan specific management and monitoring protocols. Accordingly, directed studies are needed to successfully establish and maintain new occurrences in perpetuity (STUDIES-5).

Potential threats to these occurrences appear to be minimal (S. Weiss pers. comm. b). One threat may be cattle grazing; however, it is not clear whether grazing benefits or adversely affects Tiburon Indian paintbrush. Recent evidence suggests the Paintbrush Hill occurrence of Tiburon paintbrush is being predated upon by black-tailed jackrabbit. This predation may be the cause of occurrence decline at this location. Exclosure experiments are currently being conducted to determine the validity of this hypothesis (C. Niederer pers. comm.). For these reasons, the Tiburon paintbrush occurrence will be monitored to assess the impacts of grazing or predation (STUDIES-16). Adaptive management decisions can then be developed on the basis of monitoring results.

### 5.4.11 Coyote Ceanothus

There are a total of three known occurrences of Coyote ceanothus throughout its range. One additional reported occurrence, from Croy Canyon in 1929, is believed to be erroneous and will not be discussed further in this section (see **Appendix D Species Accounts** for more information). All known occurrences are located in the study area. One of these occurrences is located northwest and southeast of Anderson Dam, east of U.S. 101. The two other occurrences are located on private property near Kirby Canyon Landfill and in Morgan Hill. All three of the known occurrences have population estimates (see Chapter 4, Section 4.6.8 *Serpentine Plants* for more information). Impacts by covered activities are limited to 3,650 individuals or 5%, whichever is less, of the Anderson Dam occurrence (**Tables 4-6 and 5-16**). This standard will be applied to the population as it existed during the 2009 surveys. It will not be applied to any new recruits that are a result of natural or artificial disturbance event such as fire.

## Biological Goals and Objectives

The Implementing Entity will protect, maintain the viability of, and increase the number and size of populations of Coyote ceanothus by protecting a total of five occurrences in the permit area (**Table 5-16**). Included in the five occurrences protected will be the three known extant occurrences. Protection of the remaining two occurrences will be accomplished through two possible methods, in order of priority: (1) acquire land for the Reserve System that supports a new occurrence by Year 45, or (2) create new occurrences by Year 40.

Within 5 years of the impact at Anderson Dam, one occurrence will be protected or created. The timing of the seismic retrofit of Anderson Dam is currently uncertain, but is expected to occur within the first 5 years of the permit term. Project implementation may need to occur sooner than anticipated due to public safety concerns. If the impacts of the project on Coyote ceanothus are greater than what was evaluated in the Plan, additional mitigation may be required to offset the additional impacts. This may also require a Plan amendment as described in Chapter 10, Section 10.3 *Modifications to the Plan*.

The total number of Coyote ceanothus occurrences protected by this Plan deviates from the number suggested in the species' Recovery Plan. The Recovery Plan (U.S. Fish and Wildlife Service 1998c) recommends the protection of eight populations prior to the consideration of delisting. There have only been three populations of this species ever discovered<sup>34</sup>, even prior to extensive development of the Santa Clara Valley. In addition, the characteristics of existing populations suggest that finding five new occurrences is highly unlikely. The Plan assessed the potential for creation of new occurrences by examining soil types, proximity to known populations, and other features of habitat suitability. It was determined that creation of two occurrences is feasible but not more. Therefore, the Habitat Plan is justified in deviating from the recommendations of the Recovery Plan.

In order for an occurrence to count as protected under the Plan, there will be a buffer of at least 500 feet between the occurrence and adverse land uses, as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush*.

In addition, Coyote ceanothus may benefit from acquisition and enhancement of natural communities that serve as primary habitat and may contain known or undiscovered occurrences, and/or provide suitable habitat for occurrence creation, including serpentine grasslands (see Section 5.3.3 *Grassland Conservation and Management*) and serpentine chaparral (see Section 5.3.4 *Chaparral and Northern Coastal Scrub Conservation and Management*).

---

<sup>34</sup> The Recovery Plan considers the Anderson Dam population as two separate occurrences, consistent with data in the CNDDDB (resulting in 5 total occurrences). For the purposes of this Plan, the Anderson Dam population is considered a single occurrence that was split by the construction of the dam (resulting in a total of 3 occurrences). A genetic study underway will help to understand the population structure of this species.

## Occurrence Acquisition

Regardless of the level of impact, the three known occurrences in the study area will be incorporated into the Reserve System (LAND-P1). Protection of occurrences will be accomplished by acquiring land for the Reserve System that supports the three unprotected occurrences. In addition, the Implementing Entity will protect two new occurrences. If new occurrences cannot be found or acquired in the Reserve System, then the Implementing Entity will create occurrences to reach this target, as described below. Acquisition may occur through fee title purchase or by obtaining conservation easements. Acquisition of the three known occurrences must occur by Year 45 (the deadline for all Reserve System acquisition).

## Occurrence Creation

If acquisition of two new occurrences is infeasible, the Implementing Entity will create up to two new occurrences of Coyote ceanothus (i.e., if no new occurrences are acquired, two will be created and if one new occurrence is acquired, one will be created). The Implementing Entity will develop a plan with the Wildlife Agencies for each occurrence creation. Each plan will include a process for creating the occurrence (e.g., use of propagules vs. use of cuttings), monitoring the created occurrence, and determining viability.

If the creation is not needed to fulfill requirements associated with covered activity implementation, the creation may occur later in the permit term but no later than by Year 40. Creation may be delayed until later in the permit term because of the need to: (1) exhaust opportunities to discover new occurrences (which are the first priority), (2) assemble enough of the Reserve System to provide suitable habitat for occurrence creation, and (3) allow sufficient time to study optimum habitat conditions, target occurrence size and structure, and propagation techniques. The decision to focus conservation efforts on occurrence creation will be made jointly with the Wildlife Agencies. The Implementing Entity, in coordination with the Wildlife Agencies, will determine the target occurrence size and structure for created occurrences based on empirical data collected on occurrences in the Reserve System and other best available science.

Population creation for Coyote ceanothus should occur on suitable sites within the Reserve System if possible. However, if no suitable sites are available in the Reserve System when they are needed to meet the deadlines (either within 5 years of the Anderson Dam impact or prior to Year 40), population creation could occur on suitable sites outside of the Reserve System if the site meets the definition of Type 1 open space and the site is managed and monitored according to the Plan.

Suitable habitat for created occurrences will be identified based on the habitat of known occurrences and any other available data at the time of acquisition (STUDIES-5). Because two of the three known extant occurrences of Coyote

ceanothus are on the east side of the Coyote Valley, the focus will be to increase the range of the species by creating the new occurrences on the west side of the valley unless the Implementing Entity demonstrates to the Wildlife Agencies that such occurrence creation is biologically infeasible. This effort will involve identifying a suitable creation site and determining biologically appropriate and viable propagation or planting techniques for this species (STUDIES-13, STUDIES-14). It will also entail studies to determine the biologically appropriate seed sampling techniques and harvest numbers for acquisition of seed from existing occurrences (STUDIES-14). In addition, field experiments will be conducted (if the number of propagules allows) to test alternative techniques for occurrence establishment using seeds (STUDIES-15) or through other mechanisms such as use of cuttings.

Coyote ceanothus is a large, woody shrub that often grows in dense, monotypic stands. Because of the possibility that a new creation could displace serpentine grasslands, created occurrences will be sited to minimize the potential for displacement of habitat for other covered species.

## **Anderson Dam Seismic Retrofit**

One occurrence will be created within 5 years of the Anderson Dam impact if a known or new occurrence has not been protected. The Anderson Dam impact is anticipated to occur in 2016. Because of the challenges of protecting one occurrence early in the permit term, the SCVWD has started efforts that will support creation of a Coyote ceanothus occurrence including the following.

- Communicating with Pepperdine University which is conducting a genetic (microsatellite) study to determine population structure.
- Communicating with UC Davis on its study of genetics (S-allele) to assess breeding system/reproductive success/population viability; and Frankia soils study to examine potential microsymbiont relationship and importance of native soil to population creation.
- Identified and mapped potentially suitable introduction sites on land recently purchased by the SCVWD on Coyote Ridge.
- Seed collection and storage from the Anderson Dam population occurrences.

Based on the studies, SCVWD will prepare a draft occurrence creation plan. Some key components include the following.

- Documentation of successful propagation methods from seed and/or cuttings in test plots by December 2013.
- Verification of site suitability and potential introduction sites through soil analysis of sites with known populations by July 2017.
- Full-scale planting effort (will involve additional seed collection and propagation) with survival monitoring; implemented between July 2017 and February 2018.

The work being conducted by SCVWD may help support the studies requirements of the Plan for this species.

## Management Techniques and Tools

To successfully manage existing occurrences and create new occurrences of Coyote ceanothus, targeted studies will be conducted to determine factors limiting the expansion of extant occurrences, as well as those necessary for establishment and maintenance of a created occurrence (STUDIES-5). Such studies will include the effect of fire on seed germination and other possible germination requirements. If necessary, studies may also be conducted to determine requirements for successful transplanting to augment new occurrences. Other studies may focus on various factors related to management and microsite needs of the species at all life stages from germination through maturity (STUDIES-5).

The targeted studies will be used to inform the target occurrence size for managed occurrences. A preliminary goal of 5,000 individuals per occurrence will be implemented as recommended in *Ceanothus ferrisiae* (Coyote ceanothus) *5-Year Review: Summary and Evaluation* (U.S. Fish and Wildlife Service 2011); if approved by the Wildlife Agencies, this number will be adjusted as necessary pending research carried out during Plan implementation to assure viable occurrences of this species.

Prescribed burns (CHAP-1) or an appropriate fire-management policy (LM-8) in chaparral, as well as managed grazing or mechanic thinning of chaparral (CHAP-2), may result in improved habitat or occurrence longevity for Coyote ceanothus. Although fire appears to be beneficial to recruitment and regeneration, burning will not be implemented on a large scale in areas with Coyote ceanothus occurrences until additional monitoring or other data collection has occurred to determine if these occurrences would be likely to benefit by being burned. The management actions above are targeted to maintain structural diversity and canopy gaps and to promote regeneration of chaparral species, which may directly or indirectly benefit Coyote ceanothus.

At least one prescribed burn (CHAP-1) will be implemented at a site yet to be identified. This area will be burned to facilitate the species' re-growth within 5 years of implementation of the Anderson Dam seismic retrofit covered activity. Subsequent burns may be conducted during the permit term, as appropriate, through the adaptive management process described in Chapter 7. Prescribed burns will promote regeneration and improve stand health. A qualified biologist will oversee the prescribed burn.

To help implement the Recovery Plan for this species (U.S. Fish and Wildlife Service 1998c), a permanent conservation seed bank for Coyote ceanothus will be established in the same manner as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush* subheading *Management Techniques and Tools* (STUDIES-12). Coyote ceanothus is the only covered plant species where created occurrences could be counted toward the mitigation component of

the Plan. In all other cases, created plant occurrences will only count toward the conservation component of the Plan. If creation is used to meet the impact mitigation component of the conservation strategy for this species, seed banking will be completed prior to the impacts.

## Uncertainties and Threats

Very little precise information about the ecology of this species exists, including information on the relationship between life history stages, population dynamics, and fire. Recent information and observations have indicated that the absence of fire may be detrimental to recovery and long-term persistence of this species (U.S. Fish and Wildlife Service 2011). It is unknown, however, if Coyote ceanothus seeds require fire for germination and establishment; accordingly, directed studies are needed to successfully establish and maintain new occurrences in perpetuity (STUDIES-5).

It is not clear if general management actions (i.e., burning or clearing chaparral) will in fact benefit or adversely affect Coyote ceanothus. For this reason, any such actions in or adjacent to Coyote ceanothus occurrences will include a monitoring component to assess impacts. Adaptive management decisions can then be developed on the basis of monitoring results (STUDIES-11).

### 5.4.12 Mt. Hamilton Thistle

There are a total of 48 known occurrences of Mt. Hamilton thistle throughout its range. There are 40 known occurrences in the study area. Only 34 of the 48 known occurrences have population estimates (see Chapter 4, Section 4.6.8 *Serpentine Plants* for more information). Impacts to six known occurrences are allowed by covered activities if no additional occurrences are discovered during the permit term (Tables 4-6 and 5-16).

## Biological Goals and Objectives

The Implementing Entity will protect, maintain the viability of, and increase the number and size of populations of Mt. Hamilton thistle by acquiring and enhancing at least 22 known, extant occurrences (Table 5-16) if no additional occurrences are discovered during the permit term. Two of the 22 occurrences are located in Santa Teresa County Park and Anderson Lake County Park and will be incorporated into the Reserve System.

The Implementing Entity will manage and monitor the 22 occurrences so that each maintains a minimum occurrence size of 2,000 individuals as recommended by the Recovery Plan for Serpentine Soil Species of the San Francisco Bay Area (U.S. Fish and Wildlife Service 1998c). The Recovery Plan's conservation strategy for Mt. Hamilton thistle recommends preserving a total of

23 populations, 55% of which should be in the “San José area” (13 populations) and 35% of which should be in “northeastern Santa Clara County and northwestern Stanislaus Counties” (eight populations). The Habitat Plan will protect and manage 22 occurrences of Mt. Hamilton thistle in perpetuity, exceeding the Recovery Plan conservation recommendations for populations in and around Santa Clara County. As such, implementation of the Plan will not cause jeopardy to, or preclude recovery of, Mt. Hamilton thistle.

Mt. Hamilton thistle is expected to benefit from acquisition and enhancement of the grassland natural communities, as these land cover types include the serpentine seeps and streams that serve as primary habitat and contain known or undiscovered occurrences (see Section 5.3.3 *Grassland Conservation and Management*).

## Acquisition of Modeled Habitat

There are 487 acres of primary modeled habitat for Mt. Hamilton thistle within the study area. A total of 204 acres (42%) of modeled habitat are located in Type 1, 2, or 3 open space with 55 acres (11%) permanently protected as Type 1 open space. The Plan will acquire a minimum of 150 acres of modeled habitat for the Reserve System. In addition, 60 acres of primary modeled habitat will be added to the Reserve system from existing open space. These acquisitions and additions will increase the proportion of protected modeled habitat in the study area to about 54% in Type 1 open space and 73% in Type 1, 2, or 3 open space (Table 5-17).

Mt. Hamilton thistle is one of eight Covered Species addressed in the Recovery Plan for Serpentine Soil Species of the Bay Area (U.S. Fish and Wildlife Service 1998c). At the time the Recovery Plan was written, known occurrences of Mt. Hamilton thistle were distributed nearly evenly on the east and west side of U.S. 101. Since the writing the Recovery Plan, and during the writing of this Plan, many more occurrences have been identified. Most new occurrences are located on the serpentine areas in and around Coyote Ridge on the east side of U.S. 101. The occurrences on the east side of the valley follow a network of drainages unique to Coyote Ridge. These drainages do not occur on the west side of the valley. As such, the Plan will focus conservation efforts for Mt. Hamilton thistle on acquiring occurrences along Coyote Ridge on the east side of the valley (J. Hillman pers. comm. and Hillman 2007). Acquisition will also be located in similar drainages that flow into San Felipe Creek. In addition, acquisition, as well as enhancement, will occur in the Santa Cruz Mountains between Calero County Park and Almaden Quicksilver County Park and on Tulare Hill.

## Occurrence Acquisition

Regardless of the level of impact, 22 known occurrences in the permit area will be acquired and incorporated into the Reserve System (LAND-P6). An effort

will be made to acquire sites in the study area on both sides of Coyote Valley to ensure geographic diversity in protected occurrences in accordance with recommendations made in the Serpentine Recovery Plan (U.S. Fish and Wildlife Service 1998c). Target acquisitions include known occurrences along Coyote Ridge (an estimated 9 of 22 occurrences). Two other occurrences in Santa Teresa and Anderson Lake County parks will be acquired, enhanced, and monitored.

There are size estimates for 36 of the known occurrences of this species, from as early as 1983 up to as recently as 2008. These estimates range from 1 to 4,500 individuals, and the total estimated size of all occurrences is 28,962 (California Natural Diversity Database 2009). Only 12 of the 22 occurrences to be protected in the Reserve System have size estimates, and these total 7,810 individuals. The total number to be protected is likely to be much larger than this estimate. In addition, since this is a short-lived, two-year perennial species that depends on local hydrology, these numbers are likely to fluctuate from year to year in response to annual fluctuations in rainfall and runoff into serpentine seeps.

As described in Chapter 4, the impact limit for this species could increase from 6 occurrences if no additional occurrences are discovered during the permit term to 8 occurrences if additional occurrences are discovered during the permit term. A minimum of 3 occurrences have to be acquired prior to any newly discovered occurrence being impacted during the permit term. In other words, a minimum of 21 occurrences will be acquired and protected in the Reserve System before a 7<sup>th</sup> occurrence is impacted and a minimum of 24 occurrences will be acquired and protected in the Reserve System before an 8<sup>th</sup> occurrence is impacted. “Minimums” are referenced here because the Implementing Entity will protect 22 occurrences, regardless of impacts. The timing of acquisition of 18 of the 22 occurrences are linked to impacts, while the remaining 4 occurrences will be acquired for recovery purposes only and thus acquisition timing of these 4 occurrences are not linked to impacts. The newly discovered and acquired occurrences must be in better condition than the impacted occurrences, according to the criteria in Section 5.3.1 *Land Acquisition and restoration Actions* subheading *Incorporating Covered Plant Species*. In addition, new occurrences must be acquired before the impacts occur and by Year 45 (the deadline for all Reserve System acquisition).

In order for an occurrence to count as protected under the Plan, there will be a buffer of at least 500 feet between the occurrence and adverse land uses, as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush*.

## Management Techniques and Tools

To successfully manage existing occurrences of Mt. Hamilton thistle, targeted studies will be conducted to determine factors limiting the expansion of extant occurrences (STUDIES-5). Such studies will include examining the effects of livestock grazing on the species by experimentally excluding livestock and

monitoring the effects on occurrences; control sites will be incorporated into these studies (STUDIES-16). Other studies may focus on various factors related to management and microsite needs of the species at all life stages from germination through maturity (STUDIES-5).

The targeted studies will be used to inform the target occurrence size for managed occurrences. The definition of an occurrence for this species depends on the location: an occurrence on the east side of Coyote Valley is defined as all occurrences in a discrete drainage, while an occurrence on the west side of Coyote Valley is defined as a specific occurrence point because the western occurrences are more likely to occur at isolated points rather than in a network of drainages (J. Hillman pers. comm.). Specific target occurrence size will be developed by Year 10 of implementation, based on empirical data collected on occurrences in the Reserve System and other best available science. The Implementing Entity, in coordination with the Wildlife Agencies, will determine the target occurrence size.

Because Mt. Hamilton thistle only occurs along creeks and drainages, the hydrologic systems that maintain these features are critical to the survival and occurrence growth of this species. Therefore, the Implementing Entity will manage and maintain the hydrologic systems (e.g., springs, streams, ponds) that support Mt. Hamilton thistle.

To help implement the Recovery Plan for this species (U.S. Fish and Wildlife Service 1998c), a permanent conservation seed bank for Mt. Hamilton thistle will be established in the same manner as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush* subheading *Management Techniques and Tools* (STUDIES-12).

## Uncertainties and Threats

Very little precise information about the ecology and population biology of this species is available, including information on the species' reproductive biology and demography. Its highly restricted habitat requirements in serpentine seeps, springs and drainages are likely limiting factors in the species' distribution and abundance. The hydrologic systems that maintain this habitat will be managed and maintained by the Plan. It is also possible that invasive weeds and insects have adverse effects and pose significant threats to the species. Further research into these threats is necessary to successfully manage this species (STUDIES-5).

It is not clear whether grazing benefits or adversely affects Mt. Hamilton thistle. For this reason, grazing in or adjacent to Mt. Hamilton thistle occurrences will include experimental exclusions and control sites, where feasible, to evaluate impacts (STUDIES-16). Adaptive management decisions can then be developed on the basis of monitoring results.

To help implement the Recovery Plan for this species (U.S. Fish and Wildlife Service 1998c), a permanent conservation seed bank for Mt. Hamilton thistle will

be established in the same manner as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian paintbrush* subheading *Management Techniques and Tools* (STUDIES-12).

### 5.4.13 Santa Clara Valley Dudleya

There are a total of 209 known occurrences of Santa Clara Valley dudleya, 207 of which are in the study area. Only 47 of the 209 known occurrences have population estimates (see Chapter 4, Section 4.6.8 *Serpentine Plants* for more information). Impacts are allowed to 11 known occurrences by covered activities (**Tables 4-6 and 5-16**) if additional occurrences are not discovered during the permit term.

## Biological Goals and Objectives

The Implementing Entity will protect, maintain the viability of, and increase the number and size of populations of Santa Clara Valley dudleya by acquiring and enhancing a minimum of 55 occurrences in the permit area (**Table 5-16**), if no additional occurrences are discovered during the permit term. Eleven of the 55 occurrences are located in County parks and will be protected when these parks are added to the Reserve System.

Santa Clara Valley dudleya is expected to benefit from the acquisition and enhancement of those grasslands (see Section 5.3.3 *Grassland Conservation and Management*) and oak woodlands that include serpentine rock outcrops (see Section 5.3.5 *Oak and Conifer Woodland Conservation and Management*).

## Occurrence Acquisition

Regardless of the level of impact, the Implementing Entity will acquire (through acquisition or conservation easement) lands that support 55 extant occurrences of Santa Clara Valley dudleya throughout its entire range in the permit area (LAND-P2). In accordance with the *Recovery Plan for Serpentine Soil Species of the San Francisco Bay Area* (U.S. Fish and Wildlife Service 1998c), occurrences will be distributed throughout the range of the species (north, central, and south). The Implementing Entity will stratify protection and acquire sites in the study area on both sides of Coyote Valley to ensure geographic diversity in protected occurrences. The majority of the known occurrences will be acquired, enhanced through improved management, and monitored along Coyote Ridge in Coyote-4, 5, and 6. The number of occurrences in parentheses after each location name will also be acquired: Santa Teresa Hills and Tulare Hill (4), west of Calero County Park (2), and north of Morgan Hill (1). Incorporation of portions of Santa Teresa, Calero, Anderson Lake and Almaden Quicksilver County parks into the Reserve System (**Table 5-5**) will protect 11 of the 55 occurrences and provide opportunities for improved management and

monitoring. This will bring total protection of this species to 57 occurrences in Type 1 open space.

The Recovery Plan recommends the protection of one occurrence in the San Martin Area because this represented the southern extent of the species range known at the time. There are two extant occurrences of Santa Clara dudleya near San Martin. One is located on a highly-parcelized, privately-owned plot and is not practical for acquisition consideration. The other occurrence is, at the writing of this Plan, in the process of being protected by a conservation easement for mitigation associated with the Corde Valle Golf Course<sup>35</sup>. Since the finalization of the Recovery Plan, the species' known range expanded south of the San Martin area (i.e., to Mount Madonna County Park). In response to new information collected since the finalization of the Recovery Plan, the Implementing Entity will acquire at least one occurrence (either known or found during the permit term) of Santa Clara Valley dudleya in the southern end of its range in the study area. This could include either the southwest or southeast portion of the study area. Therefore, the Implementing Entity will not focus on acquiring occurrences in the San Martin area.

As described in Chapter 4, the impact limit for this species could increase from 11 occurrences, if no additional occurrences are discovered during the permit term, to 14 occurrences, if additional occurrences are discovered during the permit term. A minimum of 4 occurrences have to be acquired prior to any newly discovered occurrence being impacted during the permit term. In other words, a minimum of 48 occurrences will be acquired and protected in the Reserve System before a 12<sup>th</sup> occurrence is impacted, a minimum of 52 occurrences will be acquired and protected in the Reserve System before a 13<sup>th</sup> occurrence is impacted, and a minimum of 56 occurrences will be acquired and protected in the Reserve System before a 14<sup>th</sup> occurrence is impacted. "Minimums" are referenced here because the Implementing Entity will protect 55 occurrences, regardless of impacts. The timing of acquisition of 44 of the 55 occurrences are linked to impacts, while the remaining 11 occurrences will be acquired for recovery purposes only and thus acquisition timing of these 11 occurrences are not linked to impacts. The newly discovered and acquired occurrences must be in better condition than the impacted occurrences, according to the criteria in Section 5.3.1 *Land Acquisition and Restoration Actions* subheading *Incorporating Covered Plant Species*. In addition, new occurrences must be acquired before the impacts occur and by Year 45 (the deadline for all Reserve System acquisition).

In order for an occurrence to count as protected under the Plan, there will be a buffer of at least 500 feet between the occurrence and adverse land uses, as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush*.

---

<sup>35</sup> This will be considered a protected occurrence once a conservation easement holder is identified and the conservation easement recorded.

## Management Techniques and Tools

To successfully manage existing occurrences of Santa Clara Valley dudleya, targeted studies will be conducted to determine the biological definition of a population and the relationship between known occurrences and genetically-defined populations. Studies will also be conducted to determine factors limiting the expansion of extant occurrences (STUDIES-5). Such studies may include examining the effects of livestock grazing on the species by experimentally excluding livestock and monitoring the effects on occurrences (STUDIES-16). Other studies may focus on various factors related to management and microsite needs of the species at all life stages from germination through maturity (STUDIES-5).

The targeted studies will be used to inform the target occurrence size for managed occurrences. For this species, the relationship between population and recorded occurrence is unclear. It is possible that multiple occurrences compromise a single population. A preliminary goal of 2,000 individuals per population will be implemented as recommended in the *Recovery Plan for Serpentine Soil Species of the San Francisco Bay Area* (U.S. Fish and Wildlife Service 1998c); if approved by the wildlife agencies, this number will be adjusted as necessary pending research carried out during Plan implementation to assure viable occurrences of this species.

To help implement the Recovery Plan for this species (U.S. Fish and Wildlife Service 1998c), a permanent conservation seed bank for Santa Clara Valley dudleya will be established in the same manner as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush* subheading *Management Techniques and Tools* (STUDIES-12).

## Uncertainties and Threats

Santa Clara Valley dudleya is a relatively well-studied plant, and more information and research is available for this species than for most of the other covered species. However, outstanding questions remain regarding the definition of a population and management issues. Research will be conducted to better define a population for this species to understand the effects of grazing. Management research will be conducted on grazing effects on Santa Clara Valley dudleya as discussed above (STUDIES-16) and on other limiting factors (STUDIES-5).

### 5.4.14 Fragrant Fritillary

There are a total of 59 known occurrences of fragrant fritillary throughout its range. There are eight known occurrences in the study area. Thirty-five of the 59 known occurrences have population estimates (see Chapter 4, Section 4.6.8 *Serpentine Plants* for more details). One of these known occurrences is expected

to be impacted by covered activities, if no additional occurrences are discovered during the permit term (**Tables 4-6 and 5-16**).

## Biological Goals and Objectives

The Implementing Entity will protect, maintain the viability of, and increase the size of populations of fragrant fritillary by acquiring and enhancing a total of four occurrences in the permit area, if no additional occurrences are discovered during the permit term (**Table 5-16**). Of these four occurrences, two will be located in the Diablo Range and two in the Santa Cruz Mountains to protect occurrences of this species across its range and across different environmental gradients.

Fragrant fritillary is expected to benefit from acquisition and enhancement of natural communities that serve as its primary or secondary modeled habitat, may contain known or undiscovered occurrences, and/or provide suitable habitat for occurrence creation, including grasslands (see Section 5.3.3 *Grassland Conservation and Management*), chaparral and coastal scrub (see Section 5.3.4 *Chaparral and Northern Coastal Scrub Conservation and Management*), oak and conifer woodlands (see Section 5.3.5 *Oak and Conifer Woodland Conservation and Management*), and seasonal wetlands (see Section 5.3.7 *Wetland and Pond Conservation and Management*).

## Acquisition of Modeled Habitat

There are 165,455 acres of fragrant fritillary modeled habitat (primary and secondary) within the study area. A total of 42,317 acres (26%) of modeled habitat are located on Type 1, 2, or 3 open space with 16,371 acres (10%) permanently protected as Type 1 open space. The Plan will acquire a minimum of 23,000 acres of modeled habitat for the Reserve System. In addition, 4,000 acres will be added to the Reserve System from existing open space. These acquisitions and additions will increase the proportion of protected modeled habitat in the study area about 26% in Type 1 open space and 39% in Type 1, 2, or 3 open space (**Table 5-17**). Land acquisition that would protect primary and secondary modeled habitat would occur in almost all Conservation Analysis Zones in the study area in which land acquisition would occur.

## Occurrence Acquisition

Regardless of the level of impact, four known extant occurrences of fragrant fritillary will be acquired for the Reserve System. Of these four, two occurrences will be protected along Coyote Ridge southeast of Metcalf Canyon and northeast of Morgan Hill (LAND-P8). The third occurrence is located in Calero County Park and will be protected through the incorporation of a portion of the park into the Reserve System (**Table 5-5**). The fourth occurrence will be located in the Santa Cruz Range.

As described in Chapter 4, the impact limit for this species could increase from 1 occurrence, if no additional occurrences are discovered during the permit term, to 3 occurrences, if additional occurrences are discovered during the permit term. A minimum of 3 occurrences have to be acquired prior to any newly discovered occurrence being impacted during the permit term. In other words, a minimum of 6 occurrences will be acquired and protected in the Reserve System before a 2<sup>nd</sup> occurrence is impacted and a minimum of 9 occurrences will be acquired and protected in the Reserve System before a 3<sup>rd</sup> occurrence is impacted. “Minimums” are referenced here because the Implementing Entity will protect 4 occurrences, regardless of impacts. The timing of acquisition of 3 of the 4 occurrences are linked to impacts, while the remaining 1 occurrence will be acquired for recovery purposes only and thus acquisition timing of this 1 occurrence is not linked to impacts. The newly discovered and protected occurrences must be in better condition than the impacted occurrences, according to the criteria in Section 5.3.1 *Land Acquisition and Restoration Actions* subheading *Incorporating Covered Plant Species*. In addition, new occurrences must be acquired before the impacts occur and by Year 45 (the deadline for all Reserve System acquisition).

In order for an occurrence to count as protected under the Plan, there will be a buffer of at least 500 feet between the occurrence and adverse land uses, as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush*.

## Management Techniques and Tools

To successfully manage newly acquired occurrences of fragrant fritillary, targeted studies will be conducted to determine factors that limit occurrence expansion as well as those necessary for establishment and maintenance of new occurrences (STUDIES-5). Such studies may include specific seed germination requirements and successful transplantation requirements to create or augment new occurrences. Other studies may examine various factors related to management and microsite needs of the species at all life stages from germination through maturity (STUDIES-5). Adaptive management decisions can then be developed on the basis of monitoring results.

The targeted studies will be used to inform the target occurrence size for each managed occurrence. The specific target occurrence size will be developed by Year 10 of implementation, based on empirical data collected on occurrences in the Reserve System and other best available science. The Implementing Entity, in coordination with the Wildlife Agencies, will determine the target occurrence size.

To help the long-term viability of this species, a permanent conservation seed bank for fragrant fritillary will be established in the same manner as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush* subheading *Management Techniques and Tools* (STUDIES-12).

## Uncertainties and Threats

Very little precise information about the ecology of this species exists, including details of its life history stages, population dynamics, microhabitat requirements (e.g., edaphic factors), demography, and pollination biology. Directed studies to determine limiting factors on survival and reproduction will help to successfully maintain and increase the size of occurrences of fragrant fritillary in perpetuity (STUDIES-5).

The actual occurrence size and age structure of the extant occurrences of fragrant fritillary in the study area are currently unknown. A key management action will be to survey extant occurrences as they are added to the Reserve System and to monitor these occurrences regularly to quantify and track the occurrence structure over time (STUDIES-5). This information will also be used to determine the targeted viable occurrence size of managed occurrences.

It is not clear whether grazing benefits or adversely affects fragrant fritillary. For this reason, grazing in or adjacent to fragrant fritillary occurrences will include experimental exclusions and control sites, where feasible, to evaluate impacts (STUDIES-16). Adaptive management decisions can then be developed on the basis of monitoring results.

### 5.4.15 Loma Prieta Hoita

There are a total of 26 known occurrences of Loma Prieta hoita throughout its range. There are 14 known occurrences in the study area. Only 18 of the 26 occurrences have population estimates (see Chapter 4, Section 4.6.9 *Non-Serpentine Plants* for more details). No impacts are allowed to these occurrences by covered activities (**Tables 4-6 and 5-16**).

## Biological Goals and Objectives

The Implementing Entity will protect, maintain the viability of, and increase the number and size of populations of Loma Prieta hoita by acquiring and enhancing four extant occurrences within the study area (**Table 5-16**), if no additional occurrences are found during the permit term. Of the four occurrences, three are currently located in County parks. Loma Prieta hoita is expected to benefit from acquisition and enhancement of natural communities that serve as primary or secondary modeled habitat and/or contain known or undiscovered occurrences, including chaparral and coastal scrub (see Section 5.3.4 *Chaparral and Northern Coastal Scrub Conservation and Management*), oak and conifer woodlands (see Section 5.3.5 *Oak and Conifer Woodland Conservation and Management*), and mixed riparian forest and woodland (see Section 5.3.6 *Riverine and Riparian Forest and Scrub Conservation and Management*).

## Acquisition of Modeled Habitat

There are 121,871 acres of Loma Prieta hoita modeled habitat (primary and secondary) within the study area. A total of 38,667 acres (32%) of modeled habitat are located on Type 1, 2, or 3 open space with 17,276 acres (14%) permanently protected as Type 1 open space. The Plan will acquire a minimum of 10,000 acres of modeled habitat for the Reserve System. In addition, 4,100 acres of modeled habitat will be added to the Reserve System from existing open space. These additions and acquisitions will increase the proportion of protected modeled habitat in the study area to about 26% in Type 1 open space and 40% in Type 1, 2, or 3 open space (**Table 5-17**).

## Occurrence Acquisition

Regardless of impact, 4 occurrences will be acquired or added to the Reserve System. Of these, three occurrences will be permanently protected by inclusion of portions of Santa Teresa, Almaden Quicksilver and Calero County parks (**Table 5-5** and **Figure 5-4**), and a fourth occurrence will be acquired on the east side of the Santa Clara Valley, just east of U.S. 101, south of Motorcycle Park. It does not have a size estimate (California Natural Diversity Database 2009).

As described in Chapter 4, the impact limit for this species could increase from 0 occurrences if no additional occurrences are discovered during the permit term to 2 occurrences if additional occurrences are discovered during the permit term. A minimum of two occurrences have to be acquired prior to any newly discovered occurrence being impacted during the permit term. In other words, a minimum of 2 occurrences will be acquired and protected in the Reserve System before the 1<sup>st</sup> occurrence is impacted and a minimum of 4 occurrences will be acquired and protected in the Reserve System before the 2<sup>nd</sup> occurrence is impacted. “Minimums” are referenced here because the Implementing Entity will protect four occurrences, regardless of impacts. The timing of these recovery efforts are not linked to impacts. The newly discovered and protected occurrences must be in better condition than the impacted occurrences, according to the criteria in Section 5.3.1 *Land Acquisition and Restoration Actions* subheading *Incorporating Covered Plant Species*. In addition, new occurrences must be acquired before the impacts occur and by Year 45 (the deadline for all Reserve System acquisition).

In order for an occurrence to count as protected under the Plan, there will be a buffer of at least 500 feet between the occurrence and adverse land uses, as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush*.

## Management Techniques and Tools

To successfully manage existing occurrences of Loma Prieta hoita, targeted studies will be conducted to determine factors limiting the expansion of extant

occurrences (STUDIES-5). Other studies may focus on factors related to management and microsite needs of the species at all life stages from germination through maturity (STUDIES-5). Adaptive management decisions can then be developed on the basis of monitoring results.

The targeted studies will be used to inform the target occurrence size for managed occurrences. The specific target occurrence size will be developed by Year 10 of implementation, based on empirical data collected on occurrences in the Reserve System and other best available science. The Implementing Entity, in coordination with the Wildlife Agencies, will determine the target occurrence size.

A permanent conservation seed bank for Loma Prieta hoita will be established in the same manner as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush* subheading *Management Techniques and Tools* (STUDIES-12).

## Uncertainties and Threats

Loma Prieta hoita has not been well studied, and little is known about its population biology or ecological effects and needs. Because management and conservation decisions for this species are limited in their potential efficacy, the Implementing Entity has little information with which to design and plan specific management and monitoring protocols. Accordingly, directed studies are needed to successfully establish and maintain new occurrences in perpetuity (STUDIES-5).

The actual occurrence size and age structure of the extant occurrences of Loma Prieta hoita in the study area are currently unknown. A key management action will be to survey and monitor the new occurrence when it is added to the Reserve System and at regular intervals thereafter to quantify and track the occurrence structure over time (STUDIES-5). This information will also be used to determine the targeted viable occurrence size of managed occurrences.

Threats to Loma Prieta hoita are thought to include cattle grazing and trampling, feral pig rooting, development, and vegetation clearing. Studies may be conducted to investigate the details of these threats and the best measures to mitigate them (STUDIES-5).

### 5.4.16 Smooth Lessingia

There are a total of 39 known occurrences of smooth lessingia throughout its range. All known occurrences are located in the study area. Only 22 of the 39 known occurrences have population estimates (see Chapter 4, Section 4.6.8 *Serpentine Plants* for more information). Impacts are allowed to six known occurrences by covered activities, if no additional occurrences are discovered during the permit term (Tables 4-6 and 5-16).

## Biological Goals and Objectives

Regardless of impact, the Implementing Entity will protect, maintain the viability of, and increase the number and size of occurrences of smooth lessingia by protecting and enhancing a total of 24 occurrences in the permit area (**Table 5-16**) if no additional occurrences are discovered during the permit term. Twelve of the 24 protected occurrences must be naturally-occurring populations and will fulfill mitigation requirements for the impact of up to six occurrences. Five of these twelve natural occurrences will be protected through the incorporation of County Park lands into the Reserve System. To contribute to recovery, an additional 12 occurrences will be protected by the Implementing Entity through two possible methods, in the order of priority: (1) acquire land for the Reserve System that supports new or rediscovered historical occurrences by Year 45, or (2) create new occurrences within the Reserve System by Year 40.

Smooth lessingia is expected to benefit from acquisition and enhancement of grassland natural communities that serve as primary habitat, may contain known occurrences, and/or provide suitable for occurrence expansion (see Section 5.3.3 *Grassland Conservation and Management*).

## Acquisition of Modeled Habitat

There are 10,491 acres of primary smooth lessingia modeled habitat within the study area. A total of 3,659 acres (35%) of modeled habitat are located on Type 1, 2, or 3 open space with 1,268 acres (12%) permanently protected as Type 1 open space. The Plan will acquire a minimum of 4,000 acres of modeled habitat, including seven new occurrences, for the Reserve System. In addition, 1,100 acres of modeled habitat will be added to the Reserve System from existing open space, including five known occurrences. These acquisitions and additions will increase the proportion of protected modeled habitat in the study area to about 61% as Type 1 open space and 73% as Type 1, 2 or 3 open space (**Table 5-17**).

## Occurrence Acquisition

Regardless of impacts, five known occurrences will be acquired through the incorporation of portions of Santa Teresa, and Calero County parks into the Reserve System (**Table 5-5** and **Figure 5-4**) to improve management, habitat enhancement, and long-term monitoring. The Implementing Entity will also acquire seven additional natural occurrences of smooth lessingia (LAND-P7) regardless of impacts.

Only two of the protected occurrences have size estimates, which total 1,815. The seven additional new occurrences that would be acquired by Plan implementation are located on the west side of U.S. 101 in the Santa Cruz Mountains foothills, on serpentine areas between Tulare Hill and Mount Madonna County Park. The Implementing Entity will also protect an additional

twelve new occurrences in the Reserve System to contribute to species recovery (LAND-P7; **Table 5-16**). If these twelve occurrences cannot be found or acquired in the Reserve System, then the Implementing Entity will create occurrences (i.e., if no occurrences are acquired, twelve occurrences will be created, if one occurrence is acquired, eleven occurrences will be created, etc.) as described below.

As described in Chapter 4, the impact limit for this species could increase from 6 occurrences, if no additional occurrences are discovered during the permit term, to 9 occurrences, if additional occurrences are discovered during the permit term (**Table 5-16**). A minimum of two occurrences have to be acquired prior to any newly discovered occurrence being impacted during the permit term. In other words, a minimum of 14 occurrences will be protected in the Reserve System before a seventh occurrence is impacted, a minimum of 16 occurrences will be protected in the Reserve System before a eighth occurrence is impacted, and a minimum of 18 occurrences will be protected in the Reserve System before a ninth occurrence is impacted. “Minimums” are referenced here because the Implementing Entity will protect 24 occurrences, regardless of impacts. The timing of acquisition of 12 of the 24 occurrences are linked to impacts (as described in Chapter 4), while the remaining 12 occurrences will be acquired to contribute to recovery and can be acquired at any time before Year 45. The newly discovered and protected occurrences must be in better condition than the impacted occurrences, according to the criteria in Section 5.3.1 *Land Acquisition and Restoration Actions* subheading *Incorporating Covered Plant Species*. In addition, new occurrences must be acquired before the impacts occur and by Year 45 (the deadline for all Reserve System acquisition).

In order for an occurrence to count as protected under the Plan, there will be a buffer of at least 500 feet between the occurrence and adverse land uses, as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush*.

## Occurrence Creation

If 12 new occurrences of smooth lessingia are not acquired for the purposes of recovery, the Implementing Entity will create up to 12 occurrences of smooth lessingia (i.e., if no occurrences are acquired, 12 will be created; if one occurrence is acquired, 11 will be created, etc.). Creation is only considered as a conservation action, not mitigation.

Occurrence creation is expected to occur later in the permit term (but no later than by Year 40) because of the need to: (1) exhaust opportunities to discover new occurrences (which are the first priority), (2) assemble enough of the Reserve System to provide suitable habitat for occurrence creation, and (3) allow sufficient time to study optimum habitat conditions, target occurrence size and structure, and propagation techniques. The decision to focus conservation effort on occurrence creation will be made jointly with CDFG and USFWS. The Implementing Entity, in coordination with the Wildlife Agencies, will determine the target occurrence size and structure for created occurrences based on

empirical data collected on occurrences in the Reserve System and other best available science.

Suitable habitat for created occurrences will be identified based on the habitat of known occurrences and any other available data at the time of acquisition (STUDIES-5). Suitable propagation and/or planting techniques will be researched and identified to create new occurrences of smooth lessingia from existing occurrences within Santa Clara County or adjacent watersheds (STUDIES-14). Biologically appropriate seed sampling techniques from existing occurrences, including sustainable harvest amounts, will also be determined through field and literature research (STUDIES-14). Additionally, if the number of propagules allow, field experiments will be conducted to test alternative techniques for occurrence establishment (STUDIES-15).

## Management Techniques and Tools

Targeted studies will be used to inform the target occurrence size for managed occurrences. A preliminary goal of 2,000 individuals per occurrence will be implemented as recommended in the *Recovery Plan for Serpentine Soil Species of the San Francisco Bay Area* (U.S. Fish and Wildlife Service 1998c); if approved by the wildlife agencies, this number will be adjusted as necessary pending research carried out during Plan implementation to assure viable occurrences of this species.

Targeted studies will be conducted to determine factors limiting the expansion of extant occurrences (STUDIES-5). Such studies will include examining the effects of livestock grazing on the species by experimentally excluding livestock and monitoring the effects on occurrences (STUDIES-16). Other studies may focus on various factors related to management and microsite needs of the species at all life stages from germination through maturity (STUDIES-5).

To help implement the Recovery Plan for this species (U.S. Fish and Wildlife Service 1998c), a permanent conservation seed bank for smooth lessingia will be established in the same manner as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush* subheading *Management Techniques and Tools* (STUDIES-12).

## Uncertainties and Threats

Very little information about the ecology and general habitat requirements of this species exists, including details of its life history stages, population dynamics, microhabitat requirements, demography, and pollination biology. Accordingly, directed studies are needed to successfully establish and maintain new occurrences in perpetuity (STUDIES-5). The management needs of the species also need investigation.

The actual size of the extant occurrences of smooth lessingia are mostly unknown. A key management action will be to survey extant occurrences as they are added to the Reserve System and monitor these occurrences regularly to quantify and track the occurrence structure over time (STUDIES-5).

Threats to smooth lessingia are thought to include cattle grazing, foot traffic (trampling), competition from invasive nonnative plants, and road and trail maintenance. Studies may be conducted to investigate the details of these threats and the best measures to mitigate them (STUDIES-5). It is not clear whether grazing benefits or adversely affects smooth lessingia. For this reason, grazing in or adjacent to smooth lessingia occurrences will include experimental exclusions and control sites, where feasible, to evaluate impacts (STUDIES-16). Adaptive management decisions can then be developed on the basis of monitoring results.

### 5.4.17 Metcalf Canyon Jewelflower

There are 11 known occurrences of Metcalf Canyon jewelflower throughout its range, 10 of which are in the study area. Only four of the 10 known occurrences have population estimates (see Chapter 4, Section 4.6.8 *Serpentine Plants* for more information). Impacts are allowed to two of the known occurrences by covered activities (Tables 4-6 and 5-16).

## Biological Goals and Objectives

The Implementing Entity will protect, maintain the viability of, and increase the number and size of populations of Metcalf Canyon jewelflower by protecting a total of 13 occurrences in the permit area. To do this, the Implementing Entity will acquire and enhance at least three known occurrences in the permit area (Table 5-16). The Implementing Entity will also protect 10 new occurrences through two possible methods, in order of priority: (1) acquire land for the Reserve System that supports new or rediscovered historical occurrences by Year 45, or (2) create new occurrences within the Reserve System by Year 40.

Metcalf Canyon Jewelflower is expected to benefit from acquisition and enhancement of grassland natural communities that serve as its primary habitat, contain known occurrences, and/or provide suitable habitat for occurrence creation (see Section 5.3.3 *Grassland Conservation and Management*).

## Acquisition of Modeled Habitat

There are 8,105 acres of primary modeled habitat for Metcalf Canyon jewelflower within the study area. A total of 2,843 acres (35%) of modeled habitat are located on Type 1, 2, or 3 open space with 984 acres (12%) permanently protected as Type 1 open space. The Plan proposes to acquire a minimum of 3,200 acres of modeled habitat for the Reserve System. In addition,

1,000 acres of modeled habitat will be added to the Reserve System from existing open space. These acquisitions and additions will increase the proportion of protected modeled habitat in the study area to about 64% as Type 1 open space and 75% as Type 1, 2, or 3 open space (**Table 5-17**).

Land acquired for the Reserve System will protect suitable habitat for Metcalf Canyon jewelflower on the north side of Tulare Hill on the west side of Coyote Valley (LAND-P4). Suitable habitat in this area includes serpentine grasslands and serpentine outcrops and road cuts that have little soil development and are surrounded by grasslands. Target areas include Coyote Ridge near Metcalf Canyon where 68 occurrences of an unidentified jewelflower have been found (Arcadis 2008). It is unclear how many of these are Metcalf Canyon jewelflower but due to the proximity of known occurrences, many are likely to be this subspecies (the other likely candidate is most beautiful jewelflower).

## Occurrence Acquisition

Regardless of the level of impact, the Implementing Entity will acquire at least three known extant occurrences of Metcalf Canyon jewelflower (LAND-P3). Acquisition of the three known occurrence must occur prior to the first impact. The Implementing Entity will also identify and protect an additional 10 new occurrences in the Reserve System to contribute to species recovery by Year 45 (the deadline for all Reserve System acquisition). If 10 new occurrences cannot be found and acquired in the Reserve System, then the Implementing Entity will create occurrences (i.e., if no occurrences are acquired, 10 will be created; if one occurrence is acquired, nine will be created, etc.) as described in the section below.

*The Recovery Plan for Serpentine Soil Species of the San Francisco Bay Area* (U.S. Fish and Wildlife Service 1998c) calls for the acquisition of nine natural occurrences of Metcalf Canyon jewelflower to meet recovery criteria. At the time the Recovery Plan was written there were 13 known, extant occurrences of Metcalf Canyon jewelflower in the study area. Currently, there are 10 known, extant occurrences within the study area. Several of these occurrences are located on private lands that are highly parcelized and urbanized, making them low-priority targets for conservation.

The Habitat Plan will protect the highest quality natural occurrences. In combination with the one existing occurrence protected in Type 1 open space, there will be four protected natural occurrences in the study area prior to the first impact to the species or by Year 45 of the Plan, whichever comes first. There are several “jewelflower” occurrences that have yet to be determined to be Metcalf Canyon jewelflower or most beautiful jewelflower. Some of these occurrences are likely to be Metcalf Canyon jewelflower. Acquisition of these or other natural occurrences would be prioritized to meet the requirement to acquire or create ten more occurrences to contribute to species recovery.

In order for an occurrence to count as protected under the Plan, there will be a buffer of at least 500 feet between the occurrence and adverse land uses, as

described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush*.

## Occurrence Creation

If new occurrences of Metcalf Canyon jewelflower are not found and preserved, the Implementing Entity will create up to 10 occurrences of Metcalf Canyon jewelflower (i.e., if no occurrences are acquired, 10 will be created; if one existing occurrence is acquired, nine will be created, etc.). Creation is only considered as a conservation action, not mitigation.

Occurrence creation is expected to occur later in the permit term (but no later than by Year 40) because of the need to: (1) exhaust opportunities to discover new occurrences (which are the first priority), (2) assemble enough of the Reserve System to provide suitable habitat for occurrence creation, and (3) allow sufficient time to study optimum habitat conditions, target occurrence size and structure, and propagation techniques. The decision to focus conservation effort on occurrence creation will be made jointly with CDFG and USFWS. The Implementing Entity, in coordination with the Wildlife Agencies, will determine the target occurrence size and structure for created occurrences based on empirical data collected on occurrences in the Reserve System and other best available science.

Targeted studies and current research will be used to inform new occurrence establishment. Suitable habitat for created occurrences will be identified based on the habitat of known occurrences and any other available data at the time of acquisition (STUDIES-5). This will involve identifying suitable locations in the Reserve System and researching and identifying biologically appropriate and viable propagation or planting techniques for this species (STUDIES-13, STUDIES-14). It will also entail conducting field and literature research to determine the biologically appropriate seed sampling techniques and harvest numbers for acquisition of seed from existing occurrences (STUDIES-14). In addition, field experiments will be conducted (if the number of propagules allows) to test alternative techniques for occurrence establishment (STUDIES-15). Extensive research is being done on the propagation needs and responses of this species by Justen Whittall and co-investigators at Santa Clara University (Whittall 2008, 2011); preliminary results indicate that successful occurrence creation is feasible. In addition, their field surveys suggest that sites for 10 occurrences should be available (J. Whittall pers. comm.; Whittall 2011). Their results and expertise, along with other scientific data available during Plan implementation, will be consulted during Plan implementation.

The Recovery Plan (U.S. Fish and Wildlife Service 1998c) recommends that protected populations be distributed throughout the range of the species, including at least 25% west of U.S. 101 and 75% in the Metcalf Canyon area, east of U.S. 101. The Implementing Entity will consider these guidelines as associated with protection and creation efforts for this Plan unless best available science indicates that a different distribution would be more beneficial to the

conservation of the species. There are currently no known occurrences west of U.S. 101.

## Management Techniques and Tools

To successfully manage and create new occurrences of Metcalf Canyon jewelflower, targeted studies will be conducted to determine factors that limit occurrence expansion, as well as those necessary for establishment and maintenance of new occurrences (STUDIES-5). Such studies may include specific seed germination requirements and successful transplantation requirements to create or augment new occurrences. Other studies may examine factors related to management and microsite needs of the species at all life stages from germination through maturity (STUDIES-5).

The targeted studies will be used to inform the target occurrence size for managed occurrences. A preliminary goal of 2,000 individuals per occurrence will be implemented as recommended in the *Recovery Plan for Serpentine Soil Species of the San Francisco Bay Area* (U.S. Fish and Wildlife Service 1998c); if approved by the Wildlife Agencies, this number will be adjusted as necessary pending research carried out during Plan implementation to assure viable occurrences of this species.

To help implement the Recovery Plan for this species (U.S. Fish and Wildlife Service 1998c), a permanent conservation seed bank for Metcalf Canyon jewelflower will be established in the same manner as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush* subheading *Management Techniques and Tools* (STUDIES-12).

## Uncertainties and Threats

Metcalf Canyon jewelflower has not been well studied, and little is known about its population biology or ecological effects and needs. Because management and conservation decisions for this species are limited in their potential efficacy, the Implementing Entity has little information with which to design and plan specific management and monitoring protocols. Accordingly, directed studies are needed to successfully establish and maintain new occurrences in perpetuity (STUDIES-5).

The actual size and age structure of the extant occurrences of Metcalf Canyon jewelflower in the study area are currently unknown. A key management action will be to survey extant occurrences as they are added to the Reserve System and regularly monitor these occurrences, as well as the newly created occurrence, to quantify and track occurrence structure over time (STUDIES-5).

Threats to Metcalf Canyon jewelflower are thought to include cattle grazing, urban development, off-road motorcycles, garbage dumping, and road

construction and maintenance. Studies may be conducted to investigate the details of these threats and the best measures to mitigate them (STUDIES-5).

### 5.4.18 Most Beautiful Jewelflower

There are a total of 86 most beautiful jewelflower known occurrences throughout its range. There are 39 known occurrences within the study area. Only 40 of the 86 known occurrences have population estimates (see Chapter 4, Section 4.6.8 *Serpentine Plants* for more information). Impacts to six known occurrences are allowed by covered activities (**Tables 4-6 and 5-16**) if no additional occurrences are discovered during the permit term.

## Biological Goals and Objectives

The Implementing Entity will protect, maintain the viability of, and increase the number and size of populations of most beautiful jewelflower by acquiring and enhancing 17 known extant occurrences in the permit area, if no additional occurrences are discovered during the permit term (**Table 5-16**). This includes acquisition of nine known occurrences for the Reserve System and the addition of eight known occurrences when portions of Alamaden Quicksilver, Calero, and Santa Teresa County parks are added into the Reserve System.

Most beautiful jewelflower is expected to benefit from acquisition and enhancement of natural communities that serve as its primary or secondary habitat and/or contain known extant occurrences, including grasslands (see Section 5.3.3 *Grassland Conservation and Management*) and chaparral and coastal scrub (see Section 5.3.4 *Chaparral and Northern Coastal Scrub Conservation and Management*).

## Acquisition of Modeled Habitat

There are 14,362 acres of most beautiful jewelflower modeled habitat (primary and secondary) within the study area. A total of 5,042 acres (35%) of modeled habitat are located on Type 1, 2, or 3 open space with 1,500 acres (10%) permanently protected as Type 1 open space. The Plan proposes to acquire a minimum of 4,000 acres of modeled habitat for the Reserve System. In addition, 1,700 acres of modeled habitat will be added to the Reserve System from existing open space. These acquisitions and addition will increase the proportion of protected modeled habitat in the study area to about 50% as Type 1 open space and 63% as Type 1, 2, or 3 open space (**Table 5-17**).

Land acquired for the Reserve System will protect suitable habitat along Coyote Ridge, in the Santa Teresa Hills, and west of Chesbro Reservoir, as well as, near Morgan Hill and in the southern end of the study area in the Santa Cruz Mountain foothills. Target areas include Coyote Ridge near Metcalf Canyon

where 68 occurrences of an unidentified jewelflower have been found (Arcadis 2008). It is unclear how many of these are most beautiful jewelflower but due to the proximity of known occurrences, many are likely to be this subspecies (the other likely candidate is Metcalf Canyon jewelflower).

## Occurrence Acquisition

Regardless of the level of impact, 17 occurrences will be protected in the Reserve System (**Table 5-16**). Eight occurrences will be incorporated into the Reserve System to improve management and monitoring, and expand each occurrence, if biologically feasible, when portions of Alamaden Quicksilver, Calero, and Santa Teresa County parks are added to the Reserve System. In addition, the Implementing Entity will acquire nine occurrences of most beautiful jewelflower (LAND-P5).

As described in Chapter 4, the impact limit for this species could increase from 6 occurrences, if no additional occurrences are discovered during the permit term, to 8 occurrences, if additional occurrences are discovered during the permit term. A minimum of 2 occurrences have to be acquired prior to any newly discovered occurrence being impacted during the permit term. In other words, a minimum of 14 occurrences will be acquired and protected in the Reserve System before the 7<sup>th</sup> occurrence is impacted and a minimum of 16 occurrences will be acquired and protected in the Reserve System before the 8<sup>th</sup> occurrence is impacted. “Minimums” are referenced here because the Implementing Entity will protect 17 occurrences, regardless of impacts. The timing of acquisition of 12 of the 17 occurrences are linked to impacts, while the remaining 5 occurrences will be acquired for recovery purposes only and thus acquisition timing of these 5 occurrences are not linked to impacts. The newly discovered and protected occurrences must be in better condition than the impacted occurrences, according to the criteria in Section 5.3.1 *Land Acquisition and Restoration Actions* subheading *Incorporating Covered Plant Species*. In addition, new occurrences must be acquired before the impacts occur and by Year 45 (the deadline for all Reserve System acquisition).

There is a high potential to acquire additional natural populations under the Plan. As stated in section above, there are several “jewelflower” occurrences that have yet to be determined to be Metcalf Canyon jewelflower or most beautiful jewelflower. Some of these occurrences are likely to be most beautiful jewelflower. In order for an occurrence to count as protected under the Plan, there will be a buffer of at least 500 feet between the occurrence and adverse land uses, as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush*.

## Management Techniques and Tools

To successfully manage occurrences of most beautiful jewelflower, targeted studies will be conducted to determine factors that limit occurrence expansion

(STUDIES-5). Such studies may examine factors related to management and microsite needs of the species at all life stages from germination through maturity (STUDIES-5). Adaptive management decisions can then be developed on the basis of monitoring results to mitigate, minimize, or eliminate limiting factors.

The targeted studies will be used to inform the target size for managed occurrences. A preliminary goal of 2,000 individuals per occurrence will be implemented as recommended in the *Recovery Plan for Serpentine Soil Species of the San Francisco Bay Area* (U.S. Fish and Wildlife Service 1998c); if approved by the Wildlife Agencies, this number will be adjusted as necessary pending research carried out during Plan implementation to assure viable occurrences of this species.

To help implement the Recovery Plan for this species (U.S. Fish and Wildlife Service 1998c), a permanent conservation seed bank for most beautiful jewelflower will be established in the same manner as described for Tiburon Indian paintbrush in Section 5.4.10 *Tiburon Indian Paintbrush* subheading *Management Techniques and Tools* (STUDIES-12).

## Uncertainties and Threats

Most beautiful jewelflower has been studied; however, little is known about its reproductive biology or demography. Herbivory and its impacts on the species are also poorly understood. Because management and conservation decisions for this species are limited in their potential efficacy, the Implementing Entity has little information with which to design and plan specific management and monitoring protocols. Accordingly, directed studies are needed to successfully establish and maintain new occurrences in perpetuity (STUDIES-5).

The age structure and occurrence trends of the extant occurrences of most beautiful jewelflower in the study area are currently unknown. An important management action will be to survey extant occurrences as they are added to the Reserve System and regularly monitor these occurrences to quantify and track the occurrence structure over time (STUDIES-5).

Threats to most beautiful jewelflower are thought to include cattle grazing, competition from invasive nonnative species (notably yellow star-thistle), habitat loss from residential development and road construction, rooting by feral pigs, and disturbance from landfill operations. Studies may be conducted to investigate the details of these threats and the best measures to mitigate them (STUDIES-5).

**Table 5-1a. Biological Goals, Objectives and Conservation Actions: Landscape Level**

Biological Goals and Objectives	Conservation Actions <sup>1,2</sup>	Monitoring Action
<b>Goal 1a. Protect and maintain natural and semi-natural landscapes.<sup>1</sup></b>		
<b>Objective 1a.1.</b> Establish a reserve system of at least 46,496 acres and 100 stream miles within the study area (see Figure 5-05 for acquisition target areas by Conservation Analysis Zones). <sup>2,3</sup>	LAND-L1. Acquire in fee title or obtain easements on 100 stream miles within the study area.	Compliance monitoring and annual reports
	LAND-L2a. Acquire in fee title or obtain easements on at least 33,205 acres of land for the Reserve System.	Compliance monitoring and annual reports
	LAND-L2b. Incorporate 13,291 acres of existing open space into the Reserve System.	Compliance monitoring and annual reports
	LAND-L3. Acquire in fee title or obtain easements on streams (100 miles), ponds (50 acres), freshwater wetlands (10 acres), and seasonal wetlands (5 acres) in all watersheds of the study area.	Compliance monitoring and annual reports
<b>Goal 1b. Protect and maintain ecological (natural) processes.</b>		
<b>Objective 1b.1.</b> Protect a range of environmental gradients (such as slope, elevation, aspect, rainfall) across a diversity of natural communities within the Reserve System. <sup>2,3</sup>	LAND-L2c. Acquire in fee title or obtain easements on 33,205 acres of land for the Reserve System that includes the full range of topographic and geographic diversity in the study area.	Compliance monitoring and annual reports
	LAND-L2d. Incorporate 13,291 acres of existing open space into the Reserve System that includes the full range of topographic and geographic diversity in the study area.	Compliance monitoring and annual reports
<b>Goal 2. Maintain or improve opportunities for movement and genetic exchange of native organisms within and between natural communities inside and connecting to areas outside of the study area.<sup>4</sup></b>		
<b>Objective 2.1.</b> Determine wildlife movement across Coyote Creek downstream of Anderson Reservoir, Pacheco Creek (SR 152), and the Pajaro River when adequate monitoring data exist on wildlife movement in the three focal areas or by year 10 of implementation, whichever comes first.	STUDIES-1. Conduct feasibility study to determine wildlife movement across Coyote Creek downstream of Anderson Reservoir, Pacheco Creek (SR 152), and the Pajaro River.	Analyze and quantify movement of indicator species to determine whether linkages are functioning as intended.
<b>Objective 2.2.</b> Protect and enhance important habitat linkages for covered species and other native species within the Reserve System and protect connectivity to habitat outside the study area (Figure 5-6 and Table 5-9). <sup>2</sup>	LAND-L4. Acquire and enhance natural and semi-natural landscapes between the Santa Teresa Hills and Metcalf Canyon to the south that will contribute to providing connectivity between the Santa Cruz Mountains and the Diablo Range to promote the movement of covered and other native species at many spatial scales (Linkage 10 in Table 5-9 and Figure 5-6).	Compliance monitoring for land acquisition. Analyze and quantify movement of indicator species to determine whether linkages are functioning as intended.
	LAND-L5. Acquire in fee title or obtain easements on 2,900 acres of serpentine grassland along Coyote Ridge to link existing protected areas and to create a large core reserve for serpentine grassland species to move within (Linkage 6 in Table 5-9 and Figure 5-6). These acreages are inclusive of, not in addition to, acquisition targets set in LAND-G3.	Compliance monitoring for land acquisition. Analyze and quantify movement of indicator species to determine whether linkages are functioning as intended.
	LAND-L6. Acquire in fee title or obtain easements on at least 3,000 acres of grassland, chaparral & coastal scrub, and oak woodland natural communities south of Henry W. Coe State Park to link this core reserve with extensive wetlands surrounding San Felipe Lake in San Benito County (Linkage 14 in Table 5-9 and Figure 5-6).	Compliance monitoring for land acquisition. Analyze and quantify movement of indicator species to determine whether linkages are functioning as intended.

Table 5-1a. Continued

Biological Goals and Objectives	Conservation Actions <sup>1,2</sup>	Monitoring Action
<b>Objective 2.3.</b> Increase the permeability of Highway 152 for species movement across Pacheco Creek and Highway 152 from the Highway 152/156 interchange east to the Santa Clara/Merced county line with structures that have the potential to most benefit movement of a variety of native species by year 20 (Linkage 15 in Figure 5-6 and Table 5-9). <sup>6,7</sup>	LAND-L7. Acquire in fee title or obtain easements on at least 2,300 acres of grassland, chaparral & coastal scrub, and oak woodland natural communities in the NE corner of the study area to link the core reserve that includes Joseph Grant County Park with SFPUC lands and other protected lands in Alameda County (Linkage 4 in Table 5-9 and Figure 5-6).	Compliance monitoring for land acquisition. Analyze and quantify movement of indicator species to determine whether linkages are functioning as intended.
	LAND-L8. Acquire in fee title or obtain easements on at least 500 acres of grassland, chaparral & coastal scrub, and oak woodland natural communities to connect Almaden Quicksilver County Park with protected open space to the east near Calero Lake (Linkage 9 in Table 5-9 and Figure 5-6).	Compliance monitoring for land acquisition. Analyze and quantify movement of indicator species to determine whether linkages are functioning as intended.
	LAND-L9. Acquire in fee title or obtain easements on 2,000 acres of conifer woodland, riparian forest & scrub, oak woodland, and grassland natural communities, in the portion of the Pescadero Watershed that is in the study area and along the Pajaro River, to maintain wildlife connections between the Santa Cruz Mountains and the Gabilan Range outside the study area (Linkages 18, 19, and 20 in Table 5-9 and Figure 5-6).	Compliance monitoring for land acquisition. Analyze and quantify movement of indicator species to determine whether linkages are functioning as intended.
	LAND-L10. Acquire in fee title or obtain easements on serpentine grassland along Coyote Ridge to protect the connection between Silver Creek and Kirby Canyon (Linkage 6 in Table 5-9 and Figure 5-6) as part of the acquisition targets set in LAND-G3.	Compliance monitoring for land acquisition. Analyze and quantify movement of indicator species to determine whether linkages are functioning as intended.
	LM-1. Remove fences and private roads in areas where they are no longer needed and where their removal could increase the permeability of the study area for wildlife.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
	LM-2. When replacing small culverts ensure that the culvert has a natural bottom and is large enough for larger mammals such as deer and mountain lions to pass, if feasible. Culverts must provide direct movement from one side of the road to the other and ensure that the culvert is visible to the target species (i.e., do not obscure entrance with vegetation). Install fencing or other features that will direct wildlife towards the culvert or other safe crossing within the first 20 years of implementation.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
	LM-3. Where structurally possible, replace culverts with free span bridges to ensure free movement for wildlife under roadways.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
	LM-4. Ensure that median barrier removal and/or median perforations are considered as alternatives during project design.	Compliance monitoring for infrastructure/structure removal, replacement, or installation.

Table 5-1a. Continued

Biological Goals and Objectives	Conservation Actions <sup>1,2</sup>	Monitoring Action
	LM-5. Remove median barriers or perforate sections of median barriers along roadways to improve successful wildlife crossings and install fencing or other features to direct wildlife to those open sections within first 20 years of implementation. Use feasibility study to determine location and length of barrier removal.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
<b>Objective 2.4.</b> Increase the permeability for species movement across Santa Clara Valley between the Diablo Range and the Santa Cruz Mountains and between Coyote Ridge and Diablo Range to the Santa Cruz Mountains via Coyote Valley, Tulare Hill, or Fisher Creek with structures that have the potential to most benefit movement of a variety of covered and other native species by year 20 (Linkages 8 and 10 in Figure 5-6 and Table 5-9). <sup>6</sup>	LM-1. Remove fences and private roads in areas where they are no longer needed and where their removal could increase the permeability of the study area for wildlife.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
	LM-2. When replacing small culverts ensure that the culvert has a natural bottom and is large enough for larger mammals such as deer and mountain lions to pass, if feasible. Culverts must provide direct movement from one side of the road to the other and ensure that the culvert is visible to the target species (i.e., do not obscure entrance with vegetation). Install fencing or other features that will direct wildlife towards the culvert or other safe crossing within the first 20 years of implementation.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
	LM-3. Where structurally possible, replace culverts with free span bridges to ensure free movement for wildlife under roadways.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
	LM-4. Ensure that median barrier removal and/or median perforations are considered as alternatives during project design.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
	LM-5. Remove median barriers or perforate sections of median barriers along roadways to improve successful wildlife crossings and install fencing or other features to direct wildlife to those open sections within first 20 years of implementation. Use feasibility study to determine location and length of barrier removal.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
<b>Objective 2.5</b> (not used)		
<b>Objective 2.6.</b> Increase the permeability for species movement from the Santa Cruz Mountains to the Pajaro River with structures that have the potential to most benefit movement of a variety of covered and other native species by year 20 (Linkage 18, 19, and 20 in Figure 5-6 and Table 5-9). <sup>6</sup>	LM-1. Remove fences and private roads in areas where they are no longer needed and where their removal could increase the permeability of the study area for wildlife.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.

Use feasibility study to determine location and length of barrier removal.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
<b>Goal 3.</b> Enhance or restore representative natural and semi-natural landscapes to maintain or increase native biological diversity.		
<b>Objective 3.1.</b> To increase the total area of quality habitat for covered and other native species and to improve hydrologic function, enhance 33,205 acres of terrestrial and aquatic land cover types and 100 miles of streams, and restore 1 mile of stream and restore or create 90 acres of aquatic land cover types within the Reserve System. If all predicted impacts occur, restore 10.4 miles of streams and restore or create 501 acres of aquatic land cover types within the Reserve System. <sup>3</sup>	LM-6. Enhance or restore an estimated 17,440 acres of grassland, 2,500 acres of chaparral and northern coastal scrub, 12,900 acres of oak woodland, 290 acres of riparian forest and scrub, and 10 acres of conifer woodland within the Reserve System.	Compliance monitoring with additional monitoring for effectiveness of restoration/enhancement/creation developed at natural community level.
	LM-7a. Restore a minimum of 1.0 miles of stream, 50 acres of riparian forest and scrub, and 20 acres of freshwater marsh, and create 20 acres of ponds to contribute to species recovery.	Compliance monitoring. Monitor baseline hydrologic function against future changes.
	LM-7b. If all predicted impacts occur, restore 10.4 miles of streams, 339 acres of riparian forest and scrub, 45 acres of freshwater marsh, and 30 acres of seasonal wetlands, and create 72 acres of ponds within all watersheds of the study area to maintain and when necessary improve stream hydrologic functions.	Compliance monitoring. Monitor baseline hydrologic function against future changes.
<b>Objective 3.2a.</b> Ensure natural fire disturbance regimes required for natural community regeneration and structural diversity, and covered species germination and recruitment occur within the Reserve System or implement management actions that mimic those natural disturbances through development of a fire management component of each reserve unit management plan. <sup>3,8</sup>	LM-8. Negotiate with Cal Fire and other local fire-fighting agencies the use of management response measures for all fire events and fire-dependent ecosystems that minimize impacts to natural communities and covered species while protecting human life and property. All burns will be responded to, and prescribed burns will be conducted, with minimum impact suppression tactics. Burn response will take into consideration ignition location and method, seasonality, weather and availability of suppression forces.	Compliance monitoring including effects of burning monitored as part of natural community enhancement. For management actions that mimic natural fire regimes, compare post-fire vegetation to baseline conditions at periodic intervals to assess the effect of various fire frequencies and intensities at promoting native plants and reducing non-native plants. Monitor target covered species response.
	LM-9. In identified “no burn” areas implement the biologically appropriate management actions that mimic the natural effects of fire (e.g., mowing, grazing, hand pulling) to subsequently improve habitat for native vegetation.	Analyze and quantify effectiveness of burning vs. other management actions in increasing diversity and quantity of native vegetation. Monitor target covered species response, if applicable.

Table 5-1a. Continued

Biological Goals and Objectives	Conservation Actions <sup>1,2</sup>	Monitoring Action
<b>Objective 3.2b.</b> Ensure natural flooding disturbance regimes required for natural community regeneration and structural diversity, and covered species germination and recruitment occur within the Reserve System or implement management actions that mimic those natural disturbances through adoption of the SCVWD Natural Flood Protection Plan (2000). <sup>3</sup>	LM-10. Integrate adopted policies for natural flood protection (i.e., Ordinance O6-1, <i>Clean, Safe Creeks and Natural Flood Protection Plan</i> , <i>Coyote Watershed Stream Stewardship Plan</i> ) into flood protection projects to protect habitat for covered fish, amphibians, and reptiles.	Compliance monitoring
<b>Objective 3.3.</b> Eradicate or reduce the cover, biomass, and distribution of existing target, non-native invasive plants and reduce the number and distribution of non-native, invasive animals to enhance natural communities and covered species habitat within the Reserve System. <sup>3</sup>	LM-11. Graze, mow, hand-pull, to reduce non-native invasive plant species, both terrestrial and aquatic, to a level where native plants can reestablish and remain dominant within the Reserve System.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
	LM-12. Eradicate or reduce nonnative pig disturbance within the Reserve System through trapping, hunting, or other control methods. Success criteria is achieved through ensuring disturbances by nonnative pigs do not impair the ability of the Reserve System from meeting the biological goals and objectives.	Analyze and quantify numbers of pigs eradicated and evidence of remaining population (e.g., pig observations or signs of damage).
	LM-13. Eradicate or reduce nonnative predators (bullfrogs, invasive fish, feral cats) within the Reserve System through habitat manipulation (e.g., periodic draining of ponds), trapping, hand capturing, electroshocking or other control methods to achieve targets identified in reserve unit management plans.	Monitor response of nonnative predators to habitat manipulation and assess efficacy of various techniques.
	LM-14. Selectively apply herbicides or other treatments to invasive plants.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
	STUDIES-2. Experimentally manage oak woodlands to reduce seedling mortality, increase seedling and sapling survival and determine factors relevant to regeneration, including browsing by mammals, birds, and insects.	Monitor research results.

## Notes:

<sup>1</sup> Habitat enhancement, monitoring, and adaptive management program, will continue in perpetuity. Restoration and creation must occur in rough step with impacts as required by the Stay-Ahead provision (see Chapter 8, Section 8.6.1). All habitat restoration will be completed by Year 40.

<sup>2</sup> Land acquisition must occur in rough step with impacts as required by the Stay-Ahead provision (see Chapter 8, Section 8.6.1). All land acquisition must be complete by Year 45. Land acquisition requiring restoration or creation of habitat for Covered Species must be complete by Year 40.

<sup>3</sup> See Tables 5-4 and Figure 5-4. Existing open space requirements for the Reserve System may be substituted with new acquisition in addition to the minimum of 33,205 acres of new acquisition required by the Plan.

<sup>4</sup> Excerpted from NCCP Act and revised for the Plan.

<sup>6</sup> Specific locations and structures will be identified as part of a feasibility study.

<sup>7</sup> Design will be based on the best available science and be consistent with Condition 6 described in Chapter 6, Section 6.4.4, subheading *Condition 6 Design and Construction Requirements for Covered*

<sup>8</sup> Fire management will be incorporated into the reserve unit management plans within 5 years of the first acquisition of the land for the reserve unit.

**Table 5-1b.** Biological Goals, Objectives, and Conservation Actions: Natural Community Level

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Grassland</b>		
<b>Goal 4.</b> Maintain and enhance grassland communities that benefit covered species and promote native biodiversity.		
<b>Objective 4.1.</b> Protect 4,130 acres of serpentine grassland containing the full range of serpentine grassland associations and species including serpentine seeps and serpentine rock outcrops as part of the Reserve System within the study area. <sup>1</sup>	LAND-G1. Acquire 4,130 acres of serpentine grassland by fee title or conservation easement with the full range of serpentine grassland associations and vegetation diversity found throughout the study area. This includes 4,000 acres of serpentine bunchgrass grassland, 120 of serpentine rock outcrops/barrens, and 10 acres of serpentine seeps.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
<b>Objective 4.2.</b> Protect 13,300 acres of annual grassland in a diversity of soils types and other environmental gradients including areas suitable for enhancing native species, provide a matrix of pond, wetland, and upland habitat, and those containing native grassland as part of the Reserve System within the study area. <sup>1</sup>	LAND-G2. Acquire 13,300 acres of annual grassland by fee title or conservation easement as part of the Reserve System. Target areas on both sides of Santa Clara Valley with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored. Acquisition of native grassland will be given priority.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
<b>Objective 4.3a.</b> Reduce cover and biomass of non-native plants. <sup>2</sup>	GRASS-1. Continue or introduce livestock and native herbivore (e.g., elk) grazing in a variety of grazing regimes.	Monitor effects of various grazing regimes on reducing nonnative plants and increasing diversity and biomass of native plants. In oak woodlands, monitor effects of various grazing regimes on oak woodland regeneration and recruitment. Monitor target covered species responses.
	GRASS-2. Conduct prescribed burns. Use targeted studies to inform methods, timing, location, and frequency.	Monitor effects of burning on reducing nonnative plants and increasing diversity and biomass of native plants. Monitor target covered species responses.
	GRASS-3. Conduct mowing in selected areas to mimic grazing where use of livestock is impractical.	Monitor effects of mowing on reducing nonnative plants and increasing diversity and biomass of native plants. Monitor target covered species response.
	GRASS-4. Conduct selected seeding of native forbs and grasses in the Reserve System.	Monitor success of seeding efforts in promoting native forbs and grasses. Monitor target covered species responses.
	LM-8. Negotiate with Cal Fire and other local fire-fighting agencies the use of management response measures for all fire events and fire-dependent ecosystems that minimize impacts to natural communities and covered species while protecting human life and property. All burns will be responded to, and prescribed burns will be conducted, with minimum impact suppression tactics. Burn response will take into consideration ignition location and method, seasonality, weather and availability of suppression forces.	Compare post-fire vegetation to baseline conditions at periodic intervals to assess the effect of various fire frequencies and intensities at promoting native plants and reducing non-native plants. Monitor target covered species response.
	LM-9. In identified “no burn” areas implement the biologically appropriate management actions that mimic the natural effects of fire (e.g., mowing, grazing, hand pulling) to subsequently improve habitat for native vegetation.	Analyze and quantify effectiveness of burning vs. other management actions in increasing diversity and quantity of native vegetation. Monitor target covered species response, if applicable.
	LM-11. Graze, mow, hand-pull, to reduce non-native invasive plant species, both terrestrial and aquatic, to a level where native plants can reestablish and remain dominant within the Reserve System.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
	LM-14. Selectively apply herbicides or other treatments to invasive plants.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 4.3b.</b> Decrease nitrogen deposition in serpentine grasslands to reduce non-native, invasive plant growth.	GRASS-1. Continue or introduce livestock and native herbivore (e.g., elk) grazing in a variety of grazing regimes.	Monitor effects of various grazing regimes on reducing nonnative plants and increasing diversity and biomass of native plants. In oak woodlands, monitor effects of various grazing regimes on oak woodland regeneration and recruitment. Monitor target covered species responses.
	GRASS-2. Conduct prescribed burns. Use targeted studies to inform methods, timing, location, and frequency.	Monitor effects of burning on reducing nonnative plants and increasing diversity and biomass of native plants. Monitor target covered species responses.
	GRASS-3. Conduct mowing in selected areas to mimic grazing where use of livestock is impractical.	Monitor effects of mowing on reducing nonnative plants and increasing diversity and biomass of native plants. Monitor target covered species response.
	GRASS-4. Conduct selected seeding of native forbs and grasses in the Reserve System.	Monitor success of seeding efforts in promoting native forbs and grasses. Monitor target covered species responses.
	LM-8. Negotiate with Cal Fire and other local fire-fighting agencies the use of management response measures for all fire events and fire-dependent ecosystems that minimize impacts to natural communities and covered species while protecting human life and property. All burns will be responded to, and prescribed burns will be conducted, with minimum impact suppression tactics. Burn response will take into consideration ignition location and method, seasonality, weather and availability of suppression forces.	Compare post-fire vegetation to baseline conditions at periodic intervals to assess the effect of various fire frequencies and intensities at promoting native plants and reducing non-native plants. Monitor target covered species response.
<b>Objective 4.3c.</b> Increase the diversity of native plants within the Reserve System. <sup>2</sup>	GRASS-1. Continue or introduce livestock and native herbivore (e.g., elk) grazing in a variety of grazing regimes.	Monitor effects of various grazing regimes on reducing nonnative plants and increasing diversity and biomass of native plants. In oak woodlands, monitor effects of various grazing regimes on oak woodland regeneration and recruitment. Monitor target covered species responses.
	GRASS-2. Conduct prescribed burns. Use targeted studies to inform methods, timing, location, and frequency.	Monitor effects of burning on reducing nonnative plants and increasing diversity and biomass of native plants. Monitor target covered species responses.
	GRASS-3. Conduct mowing in selected areas to mimic grazing where use of livestock is impractical.	Monitor effects of mowing on reducing nonnative plants and increasing diversity and biomass of native plants. Monitor target covered species response.
	GRASS-4. Conduct selected seeding of native forbs and grasses in the Reserve System.	Monitor success of seeding efforts in promoting native forbs and grasses. Monitor target covered species responses.
	LM-8. Negotiate with Cal Fire and other local fire-fighting agencies the use of management response measures for all fire events and fire-dependent ecosystems that minimize impacts to natural communities and covered species while protecting human life and property. All burns will be responded to, and prescribed burns will be conducted, with minimum impact suppression tactics. Burn response will take into consideration ignition location and method, seasonality, weather and availability of suppression forces.	Compare post-fire vegetation to baseline conditions at periodic intervals to assess the effect of various fire frequencies and intensities at promoting native plants. Monitor target covered species response.
	LM-9. In identified “no burn” areas implement the biologically appropriate management actions that mimic the natural effects of fire (e.g., mowing, grazing, hand pulling) to subsequently improve habitat for native vegetation.	Analyze and quantify effectiveness of burning vs. other management actions in increasing diversity and quantity of native vegetation. Monitor target covered species response, if applicable.

Table 5-1b. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 4.4.</b> Increase the distribution and availability of California ground squirrels to increase the prey base for San Joaquin kit fox and to increase burrow availability within grassland for California tiger salamander, California red-legged frog, western burrowing owl, San Joaquin kit fox, and other native species within the Reserve System. <sup>2</sup>	GRASS-5. Prohibit use of rodenticides within the Reserve System, except when needed to protect the integrity of structures, such as levees, stock ponds and dams.	Monitor population trend of California ground squirrels. Track changes in burrowing mammal colony size over time.
	GRASS-6. Introduce livestock grazing where it is not currently used, and where conflicts with covered activities are minimized, to reduce vegetative cover and biomass that currently excludes ground squirrel and encourage ground squirrel colonization of new areas within the Reserve System.	Monitor population trend of California ground squirrels. Analyze and quantify changes in burrowing mammal colony size over time.
<b>Chaparral and Northern Coastal Scrub</b>		
<b>Goal 5.</b> Maintain and enhance functional chaparral and northern coastal scrub communities to benefit covered species and promote native biodiversity.		
<b>Objective 5.1.</b> Protect 2,500 acres of chaparral and northern coastal scrub containing the full range of chaparral and northern coastal scrub community associations and manage it as part of the Reserve System within the study area. <sup>1</sup>	LAND-C1. Acquire 400 acres of northern mixed chaparral/chamise chaparral by fee title or conservation easement.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-C2. Acquire 700 acres of mixed serpentine chaparral by fee title or conservation easement.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-C3. Acquire 1,400 acres of northern coastal scrub/Diablan sage scrub by fee title or conservation easement.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
<b>Objective 5.2.</b> Enhance all acquired chaparral and northern coastal scrub land cover types by promoting regeneration and succession to sustain the natural processes and native species diversity found in these communities within the Reserve System. <sup>2</sup>	STUDIES-2. Determine factors relevant to the health and regeneration of native chaparral/scrub species. Targeted studies will be initiated within first 10 years of plan implementation. Use results of targeted studies to revise and improve management actions.	Conduct targeted research that identifies key factors affecting regeneration and succession of chaparral/scrub.
	CHAP-1. Conduct prescribed burns in chaparral and northern coastal scrub to maintain canopy gaps and promote regeneration. Use targeted studies to inform locations and frequency.	Monitor effects of burning on promoting canopy gaps, regeneration, and succession in chaparral and northern coastal scrub.
	CHAP-2. Mechanically thin chaparral and northern coastal scrub to promote structural diversity. Use targeted studies to inform location and frequency.	Monitor effects of mechanical thinning on promoting canopy gaps, regeneration, and succession in chaparral and northern coastal scrub.
	CHAP-3. Identify areas in the Santa Cruz Mountains and eastern mountains where adjacent natural communities (e.g. grassland, oak woodland, conifer forests) are encroaching on chaparral and scrub land cover and, if appropriate, work to reduce the spread through manual reduction.	Analyze and quantify spread of adjacent natural communities into chaparral and scrub land cover types. Study spread rate after manual reduction.
	LM-8. Negotiate with Cal Fire and other local fire-fighting agencies the use of management response measures for all fire events and fire-dependent ecosystems that minimize impacts to natural communities and covered species while protecting human life and property. All burns will be responded to, and prescribed burns will be conducted, with minimum impact suppression tactics. Burn response will take into consideration ignition location and method, seasonality, weather and availability of suppression forces.	Compare post-fire vegetation to baseline conditions at periodic intervals to assess the effect of various fire frequencies and intensities at promoting native plants and reducing non-native plants. Monitor target covered species response.

Table 5-1b. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Oak and Conifer Woodland</b>		
<b>Goal 6.</b> Maintain and enhance functional oak woodland communities to benefit covered species and promote native biodiversity.		
<b>Objective 6.1.</b> Protect 1,700 acres of valley oak woodland, 7,100 acres of mixed oak woodland and forest, 2,900 acres of coast live oak woodland and forest, 1,100 acres of blue oak woodland, 80 acres of foothill pine-oak woodland, and 20 acres of mixed evergreen forest, containing the full range of oak woodland associations and species, and that provide a matrix of pond, wetland, and upland habitat as part of the Reserve System within the study area. <sup>1</sup>	LAND-OC1. Acquire in fee title or obtain conservation easements on 7,100 acres of mixed oak woodland and forest, including land in both the Santa Cruz Mountains and the Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-OC2. Acquire 2,900 acres of coast live oak woodland and forest by fee title or conservation easement, including land in both the Santa Cruz Mountains and the Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-OC3. Acquire 1,100 acres of blue oak woodland and 1,700 acres of valley oak woodland by fee title or conservation easement including land in both the Santa Cruz Mountains and the Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-OC4. Acquire 80 acres of foothill pine-oak woodland and forest by fee title or conservation easement, including land in both the Santa Cruz Mountains and Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-OC5. Acquire 20 acres of mixed evergreen forest by fee title or conservation easement including land in both the Santa Cruz Mountains and Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
<b>Objective 6.2a.</b> Enhance all acquired oak woodland land cover types by reducing invasive plant and animal species. <sup>2</sup>	LM-12. Eradicate or reduce nonnative pig disturbance within the Reserve System through trapping, hunting, or other control methods. Success criteria is achieved through ensuring disturbances by nonnative pigs do not impair the ability of the Reserve System from meeting the biological goals and objectives.	Monitor effectiveness of pig removal efforts and response of oak woodlands once pigs are removed.
	LM-14. Selectively apply herbicides or other treatments to invasive plants.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
	OAK-1. Conduct prescribed burns in low-density oak woodlands to enhance the community and to reduce non-native, invasive grass cover beneath oaks and encourage growth of a native understory and oak seedlings.	Monitor effects of burning on promoting regeneration and recruitment of oak woodlands and understory land cover. Monitor covered species response.
	GRASS-1. Continue or introduce livestock and native herbivore (e.g., elk) grazing in a variety of grazing regimes.	Monitor effects of various grazing regimes on reducing nonnative plants and increasing diversity and biomass of native plants. In oak woodlands, monitor effects of various grazing regimes on oak woodland regeneration and recruitment. Monitor target covered species responses.

Table 5-1b. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 6.2b.</b> Promote regeneration and recruitment of all acquired oak woodland land cover types by promoting regeneration and recruitment of component species. <sup>2</sup>	OAK-1. Conduct prescribed burns in low-density oak woodlands to enhance the community and to reduce non-native, invasive grass cover beneath oaks and encourage growth of a native understory and oak seedlings.	Monitor effects of burning on promoting regeneration and recruitment of oak woodlands and understory land cover. Monitor covered species response.
	GRASS-1. Continue or introduce livestock and native herbivore (e.g., elk) grazing in a variety of grazing regimes.	Monitor effects of various grazing regimes on reducing nonnative plants and increasing diversity and biomass of native plants. In oak woodlands, monitor effects of various grazing regimes on oak woodland regeneration and recruitment. Monitor target covered species responses.
<b>Objective 6.2c.</b> Enhance all acquired oak woodland and cover types by sustaining the natural processes found in these communities. <sup>2</sup>	STUDIES-3. Experimentally manage oak woodlands to reduce seedling mortality, increase seedling and sapling survival and determine factors relevant to regeneration, including browsing by mammals, birds, and insects.	Conduct targeted research that identifies key factors affecting seedling mortality, seedling and sapling survival and factors relevant to oak woodland regeneration.
	GRASS-1. Continue or introduce livestock and native herbivore (e.g., elk) grazing in a variety of grazing regimes.	Monitor effects of various grazing regimes on reducing nonnative plants and increasing diversity and biomass of native plants. In oak woodlands, monitor effects of various grazing regimes on oak woodland regeneration and recruitment. Monitor target covered species responses.
	OAK-1. Conduct prescribed burns in low-density oak woodlands to enhance the community and to reduce non-native, invasive grass cover beneath oaks and encourage growth of a native understory and oak seedlings.	Monitor effects of burning on promoting regeneration and recruitment of oak woodlands and understory land cover. Monitor covered species response.
<b>Goal 7.</b> Maintain and enhance functional conifer woodland communities to benefit covered species and promote native biodiversity.		
<b>Objective 7.1.</b> Protect 10 acres of redwood forest as part of the Reserve System within the study area. <sup>1</sup>	LAND-OC6. Acquire 10 acres of redwood forest by fee title or conservation easement.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
<b>Objective 7.2.</b> Enhance all acquired conifer woodland communities by promoting ecologically appropriate structure, density, and species composition to preserve and sustain the natural processes and native species diversity found in these communities. <sup>3</sup>	STUDIES-4. Experimentally manage redwood forest to determine factors relevant to regeneration and maintenance; possibly including prescribed burning, selective thinning, and other management actions to meet this objective.	Conduct targeted research in redwood forest, ponderosa pine woodland, and knobcone pine woodland to guide management actions and other factors relevant to regeneration and maintenance.
	OAK-2. Conduct prescribed burns in redwood forest to maintain or enhance native species diversity in the mid-canopy and understory.	Monitor effects of burning on promoting native species diversity.
	OAK-3. Mechanically thin the understory of redwood forest in target areas to promote a healthy understory/canopy.	Monitor effects of mechanical thinning on regeneration and succession in the understory and canopy of conifer woodlands. Monitor target covered species response, if applicable.

Table 5-1b. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Riverine and Riparian Forest and Scrub</b>		
<b>Goal 8.</b> Improve the quality of streams and the hydrologic and geomorphic processes that support them to maintain a functional aquatic and riparian community to benefit covered species and promote native biodiversity.		
<b>Objective 8.1.</b> Protect 100 miles of streams to promote habitat function, wildlife movement, and stream temperature moderation as part of the Reserve System within the study area. <sup>1, 3</sup>	STREAM-1. Exclude livestock access to target stream segments (e.g., Pacheco Creek, floodplain of Coyote Creek) using exclusion fencing, off-channel water sources, and other potential actions.	Conduct pre- and post-treatment monitoring to document vegetation and covered-species response to exclusion.
	LAND-R1. Extend the Uvas Creek Park Preserve 1.6 miles upstream to Hecker Pass Highway and setback expected development adjacent to this stream segment by a minimum of 100 feet to protect the Uvas Creek Corridor consistent with Goals 5-5, 5-7, and 5-8 of the approved City of Gilroy Hecker Pass Specific Plan. Target acquisitions will contribute to the protection of a total of 800 acres of riparian woodland and forest in the Uvas, Llagas, and Pacheco watersheds.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
<b>Objective 8.2.</b> If all impacts occur, restore 10.4 stream miles on acquired fish bearing stream, as identified in Figure 3-12, within the Reserve System. <sup>2</sup>	STREAM-1. Exclude livestock access to target stream segments (e.g., Pacheco Creek, floodplain of Coyote Creek) using exclusion fencing, off-channel water sources, and other potential actions.	Conduct pre- and post-treatment monitoring to document vegetation and covered-species response to exclusion.
	STREAM-2. Plant and/or seed in native understory and overstory riparian vegetation within 15 feet of the edge of the low-flow channel to create structural diversity, provide overhead cover, and moderate water temperature at all riparian restoration sites.	Monitor the efficacy of seeding efforts with respect to structural diversity, overhead cover, and water temperature compared to designated reference locations. Indicator species will be selected and success criteria developed for large-scale restoration projects from the reference locations.
	STREAM-3. Plant and/or seed in native riparian vegetation in gaps in existing riparian corridors, or re-establish severely degraded or historic riparian corridors, to promote continuity within conservation lands.	STREAM-4. Plant and/or seed in native riparian vegetation in gaps in existing riparian corridors to promote continuity.
	LM-11. Graze, mow, hand-pull, to reduce non-native invasive plant species, both terrestrial and aquatic, to a level where native plants can reestablish and remain dominant within the Reserve System.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
<b>Objective 8.3.</b> Enhance all miles of streams within the Reserve System to promote natural community functions, and habitat heterogeneity and connectivity. <sup>2</sup>	STREAM-4. Replace concrete, earthen or other engineered channels as part of the 10.4 miles of stream restoration to restore floodplain connectivity. Location and length will be determined by site-specific conditions.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	STREAM-5. Replace confined channels to restore floodplain connectivity and commensurate functions as part of the 10.4 miles of stream restoration. Location and length will be determined by site-specific conditions.	Conduct pre- and post-treatment monitoring of community function (performance of ecological processes); habitat composition, structure and pattern; and connectivity as part of a targeted study.
	STREAM-6. Manage watershed-wide fine sediment inputs by conditioning controls on runoff from all development projects (see Condition 3) to improve riverine habitat functions and geomorphic processes.	Conduct annual spot checks on new developments to determine whether sediment run-off provisions are consistent with the Conditions outlined in this Plan.

Table 5-1b. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Goal 9.</b> Maintain a functional riparian forest and scrub community at a variety of successional stages and improve these communities to benefit covered species and promote native biodiversity.		
<b>Objective 9.1.</b> Protect a minimum of 250 acres of large (at least 10 acres), contiguous stands of willow riparian forest and scrub or mixed riparian forest and woodland within the 100-year floodplain to maximize the width of native vegetation below dams to promote habitat function, wildlife movement, and stream temperature moderation as part of the Reserve System within the study area. Up to 578 acres of riparian forest and scrub will be protected if all estimated impacts occur. <sup>1</sup>	LAND-R2. Acquire in fee title or obtain conservation easements on lands that protect at least 250 acres and up to 578 acres of existing willow riparian forest and scrub or mixed riparian forest and woodland, including areas that provide key connectivity between existing riparian habitats in upper Coyote Creek, San Felipe Creek, Uvas Creek, Tar Creek, Little Arthur Creek, and Pacheco Creek.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	STREAM-1. Exclude livestock access to target stream segments (e.g., Pacheco Creek, floodplain of Coyote Creek) using exclusion fencing, off-channel water sources, and other potential actions.	Conduct pre- and post-treatment monitoring to document vegetation and covered-species response to exclusion.
<b>Objective 9.2.</b> Protect a minimum of 40 acres of large (at least 10 acres), contiguous stands of Central California sycamore alluvial woodland within the 100-year floodplain to maximize the width of native vegetation below dams to promote habitat function, wildlife movement, and stream temperature moderation as part of the Reserve System within the study area. <sup>1</sup>	LAND-R3. Acquire in fee title or obtain conservation easements on lands that protect at least 40 acres of existing Central California sycamore alluvial woodland to ensure that this very rare and threatened land cover type is preserved in the study area.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	STREAM-1. Exclude livestock access to target stream segments (e.g., Pacheco Creek, floodplain of Coyote Creek) using exclusion fencing, off-channel water sources, and other potential actions.	Conduct pre- and post-treatment monitoring to document vegetation and covered-species response to exclusion.
<b>Objective 9.3.</b> Restore an acre of high-quality willow riparian forest and scrub and mixed riparian forest and woodland and two acres of Central California sycamore alluvial woodland at a variety of successional stages within the Reserve System for every acre removed by covered activities (up to 339 acres of willow and mixed riparian forest and up to 14 acres of sycamore woodland if all impacts occur). <sup>2</sup>	STREAM-2. Plant and/or seed in native understory and overstory riparian vegetation within 15 feet of the edge of the low-flow channel to create structural diversity, provide overhead cover, and moderate water temperature at all riparian restoration sites.	Monitor the efficacy of seeding efforts with respect to structural diversity, overhead cover, and water temperature compared to designated reference locations. Indicator species will be selected and success criteria developed for large-scale restoration projects from the reference locations.
	STREAM-3. Plant and/or seed in native riparian vegetation in gaps in existing riparian corridors, or re-establish severely degraded or historic riparian corridors, to promote continuity within conservation lands.	STREAM-4. Plant and/or seed in native riparian vegetation in gaps in existing riparian corridors to promote continuity.
<b>Objective 9.4.</b> Enhance all riparian forest and scrub at a variety of successional stages within the Reserve System. <sup>2</sup>	STREAM-1. Exclude livestock access to target stream segments (e.g., Pacheco Creek, floodplain of Coyote Creek) using exclusion fencing, off-channel water sources, and other potential actions.	Conduct pre- and post-treatment monitoring to document vegetation and covered-species response to exclusion.
<b>Objective 9.5.</b> Restore at least 50 acres of willow riparian forest and scrub and mixed riparian woodland to increase available habitat species and enhance connectivity within the Reserve System to contribute to species recovery. <sup>2</sup>	STREAM-2. Plant and/or seed in native understory and overstory riparian vegetation within 15 feet of the edge of the low-flow channel to create structural diversity, provide overhead cover, and moderate water temperature at all riparian restoration sites.	Monitor the efficacy of seeding efforts with respect to structural diversity, overhead cover, and water temperature compared to designated reference locations. Indicator species will be selected and success criteria developed for large-scale restoration projects from the reference locations.
	STREAM-3. Plant and/or seed in native riparian vegetation in gaps in existing riparian corridors, or re-establish severely degraded or historic riparian corridors, to promote continuity within conservation lands.	STREAM-4. Plant and/or seed in native riparian vegetation in gaps in existing riparian corridors to promote continuity.

Table 5-1b. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Wetland and Pond</b>		
<b>Goal 10.</b> Maintain, enhance, and create or restore functional pond, freshwater perennial wetland, and seasonal wetland habitats that benefit covered species and promote native biodiversity.		
<b>Objective 10.1.</b> Protect a minimum of 10 acres total of perennial wetlands, 5 acres total of seasonal wetlands, and 50 total acres of ponds as part of the Reserve System within the study area to contribute to species recovery, regardless of impacts. <sup>1</sup> Aquatic habitat preserved for the purposes of the Plan must be adjacent to permanently protected upland habitat for covered species.	LAND-WP1a. Acquire in fee title or conservation easement 10 acres of perennial freshwater wetlands suitable for covered or native species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-WP2a. Acquire in fee title or conservation easement 5 acres of seasonal freshwater wetlands suitable for covered or native species and/or other seasonal wetlands capable of being enhanced or restored to support covered species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-WP3a. Acquire in fee title or conservation easement 50 acres of ponds suitable for covered or native species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
<b>Objective 10.2.</b> Protect up to 50 acres of perennial wetlands, 30 acres of seasonal wetlands, and 104 acres of ponds as part of the Reserve System if all estimated impacts occur. <sup>1</sup> Aquatic habitat preserved for the purposes of the Plan must be adjacent to permanently protected upland habitat for covered species	LAND-WP1b. Acquire in fee title or conservation easement up to 50 acres of perennial freshwater wetlands suitable for covered or native species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-WP2b. Acquire in fee title or conservation easement up to 30 acres of seasonal freshwater wetlands suitable for covered or native species and/or other seasonal wetlands capable of being enhanced or restored to support covered species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-WP3b. Acquire in fee title or conservation easement up to 104 acres of ponds suitable for covered or native species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
<b>Objective 10.3.</b> As determined by covered and native species needs, enhance all freshwater and seasonal wetlands and ponds by increasing native vegetative cover, biomass, and structural diversity in and around the margins within five years of pond or wetland acquisition within the Reserve System. <sup>2</sup>	POND-1. Install fencing that will reduce grazing pressure and exclude feral pigs on portions of ponds and wetlands and provide vegetated refuge sites for covered species. Fence installation will be carefully applied to avoid negative impacts on small mammal movement and upland habitat.	Monitor effectiveness of fencing to exclude livestock and feral pigs and compare vegetation inside of fencing to vegetation outside of fencing. Evaluate success of wetland and pond enhancement using established success criteria.
	POND-2. Install woody debris around perimeter and in submerged banks of ponds and wetlands to create basking habitat and cover for native juvenile amphibians and turtles. Materials imported from outside of the watershed shall be treated for chytrid and other potential pathogens prior to installation.	Analyze and quantify effectiveness of created basking site through routine monitoring in ponds with known western pond turtle occupancy.
	POND-3. Plant native emergent vegetation around the perimeter and in ponds and wetlands.	Monitor survivorship of planting, quantify vegetated perimeter of pond, describe habitat quality and periodically survey for species response from covered amphibians and reptiles. Evaluate success of wetland and pond enhancement using established success criteria.
	POND-4. Clear vegetation and/or remove sediment in a way that minimizes negative effects on covered species when vegetation and/or sediment restricts the ability of the aquatic environment from meeting the biological goals and objectives of the Plan.	Evaluate success of wetland and pond enhancement using established success criteria.

Table 5-1b. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
	LM-12. Eradicate or reduce nonnative pig disturbance within the Reserve System through trapping, hunting, or other control methods. Success criteria is achieved through ensuring disturbances by nonnative pigs do not impair the ability of the Reserve System from meeting the biological goals and objectives.	Analyze and quantify numbers of pigs eradicated and evidence of remaining population (e.g., pig observations or signs of damage).
<b>Objective 10.4.</b> Enhance all ponds by reducing the cover and biomass of non-native, invasive plants in the adjacent uplands between the functional perimeter of the ponds and within 0.5 miles. Pond enhancement will begin immediately after reserve unit management plans are completed or updated for each reserve unit. <sup>2</sup>	LM-11. Graze, mow, hand-pull, to reduce non-native invasive plant species, both terrestrial and aquatic, to a level where native plants can reestablish and remain dominant within the Reserve System.	Evaluate success of wetland and pond enhancement using established success criteria.
	LM-14. Selectively apply herbicides or other treatments to invasive plants.	Evaluate success of wetland and pond enhancement using established success criteria.
	STUDIES-5. Conduct targeted studies to determine factors limiting the expansion of the covered plant species, including but not limited to its management and micro-site needs, and implement measures to mitigate or eliminate these factors to promote occurrence expansion.	Monitor research results.
	POND-3. Plant native emergent vegetation around the perimeter and in ponds and wetlands.	Monitor survivorship of planting, quantify vegetated perimeter of pond, describe habitat quality and periodically survey for species response from covered amphibians and reptiles. Evaluate success of wetland and pond enhancement using established success criteria.
	POND-5. If biologically appropriate, graze or mechanically thin around pond perimeter to mimic grazing and promote native species.	Evaluate success of wetland and pond enhancement using established success criteria.
<b>Objective 10.5.</b> Enhance all ponds and wetlands within the Reserve System by eradicating or reducing density of exotic species by 95% that are detrimental to native pond and wetland biodiversity to increase number of ponds and wetlands occupied by covered species. Wetland and pond enhancement will begin immediately after reserve unit management plans are completed or updated for each reserve unit. <sup>2</sup>	LM-12. Eradicate or reduce nonnative pig disturbance within the Reserve System through trapping, hunting, or other control methods. Success criteria is achieved through ensuring disturbances by nonnative pigs do not impair the ability of the Reserve System from meeting the biological goals and objectives.	Analyze and quantify numbers of pigs eradicated and evidence of remaining population (e.g., pig observations or signs of damage).
	LM-13. Eradicate or reduce nonnative predators (bullfrogs, invasive fish, feral cats) within the Reserve System through habitat manipulation (e.g., periodic draining of ponds), trapping, hand capturing, electroshocking or other control methods to achieve targets identified in reserve unit management plans.	Monitor response of nonnative predators to habitat manipulation. Evaluate effect of predator abatement on native pond and wetland biodiversity. Determine presence of covered species.
	POND-1. Install fencing that will reduce grazing pressure and exclude feral pigs on portions of ponds and wetlands and provide vegetated refuge sites for covered species. Fence installation will be carefully applied to avoid negative impacts on small mammal movement and upland habitat.	Monitor effectiveness of fencing to exclude livestock and feral pigs and compare vegetation inside of fencing to vegetation outside of fencing. Evaluate success of wetland and pond enhancement using established success criteria.
<b>Objective 10.6.</b> Restore at least 20 acres of freshwater and seasonal wetlands to increase available habitat species and enhance connectivity among existing ponds and wetlands for covered species within the Reserve System to contribute to species recovery. <sup>2</sup>	POND-6. Restore 20 acres of perennial freshwater marsh within the Reserve System in suitable sites and those likely to support covered species.	Compliance monitoring. Monitor freshwater marsh and wetland restoration and assess whether success criteria are being met. Assess connectivity of restored complexes.
<b>Objective 10.7.</b> In addition to the restoration of wetlands described in <b>Objective 10.6</b> , restore up to 55 acres of perennial freshwater and seasonal wetlands in-kind within the Reserve System to increase available habitat and enhance connectivity among existing ponds and wetlands for covered species if all anticipated impacts occur. <sup>2</sup>	POND-7. In addition to the perennial freshwater marsh restoration described in <b>POND-6</b> , restore up to 25 acres of perennial freshwater marsh within the Reserve System in the Santa Cruz Mountains, Santa Clara Valley, and Diablo Range.	Compliance monitoring. Monitor freshwater marsh and wetland restoration and assess whether success criteria are being met. Assess connectivity of restored complexes.
	POND-8. Restore up to 30 acres of seasonal wetlands within the Reserve System in the Santa Cruz Mountains, Santa Clara Valley, and Diablo Range.	Compliance monitoring. Monitor freshwater marsh and wetland restoration and assess whether success criteria are being met. Assess connectivity of restored complexes.

Table 5-1b. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 10.8.</b> Create at least 20 acres of ponds at 40 sites to increase available covered species habitat and enhance connectivity among existing ponds and wetlands within the Reserve System. <sup>2</sup>	POND-9. Create at least 20 acres of ponds at 40 sites, at least 10 sites in the Santa Cruz Mountains and 20 sites in the Diablo Range.	Compliance monitoring. Monitor pond construction and assess whether success criteria are being met.
<b>Objective 10.9.</b> In addition to the creation of ponds described in <b>Objective 10.8</b> , create up to 52 acres of ponds in-kind within the Reserve System to increase the amount available habitat and enhance connectivity among existing ponds and wetlands if all anticipated impacts occur. <sup>2</sup>	POND-10. In addition to the creation of ponds described in POND-9, create up to 52 acres of ponds in-kind within the Reserve System to increase the amount available habitat and enhance connectivity among existing ponds and wetlands if all anticipated impacts occur. <sup>3</sup>	Compliance monitoring. Monitor pond construction and assess whether success criteria are being met.
<p>Notes:</p> <p><sup>1</sup> Land acquisition must occur in rough step with impacts as required by the Stay-Ahead provision (see Chapter 8, Section 8.6.1). All land acquisition must be complete by Year 45. Section 5.3 of the Plan provides more detail on areas targeted for acquisition for each natural community. Reserve lands will be managed in accordance with reserve unit management plans, completed within 5 years of the acquisition of the 1st parcel within the reserve unit. The conservation strategy for aquatic land cover types includes preservation/enhancement, restoration, and/or creation. See Tables 5-14 and 5-15 for details.</p> <p><sup>2</sup> Habitat enhancement, monitoring, and adaptive management program, will continue in perpetuity. Restoration and creation must occur in rough step with impacts as required by the Stay Ahead provision (see Chapter 8, Section 8.6.1). All habitat restoration will be completed by Year 40 unless otherwise noted in this table. Reserve lands will be managed in accordance with reserve unit management plans, completed within 5 years of the acquisition of the 1st parcel within the reserve unit. The conservation strategy for aquatic land cover types are three fold and include preservation/enhancement, restoration, and/or creation. See Tables 5-14 and 5-15 for details.</p> <p><sup>3</sup> Watershed-specific targets are established for certain stream reaches within each watershed.</p>		

**Table 5-1c.** Biological Goals, Objectives and Conservation Actions: Wildlife

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Goal 11.</b> Improve the viability of existing Bay checkerspot butterfly populations, increase the number of populations, and expand the geographic distribution to ensure the long-term persistence of the species in the study area.		
<b>Objective 11.1.</b> Protect 4,554 acres of modeled Bay Checkerspot butterfly habitat, including 4,000 acres of serpentine grasslands in core populations of Bay checkerspot butterfly, to protect a range of slopes, aspects, and microhabitats as part of the Reserve System within the study area. <sup>1</sup>	LAND-G3. Acquire in fee title or obtain conservation easements on 4,000 acres of suitable serpentine grassland habitat along ridges for Bay checkerspot butterfly on Silver Creek Hills, Coyote Ridge, Pigeon Point, Tulare Hill, Santa Theresa Hills, areas west of Calero Reservoir, and the Kalanas, and Hale/Falcon Crest in fee title or conservation easement. Habitat acquisition on Coyote Ridge and Tulare Hill is top priority. For other sites totaling 554 acres, prioritize sites, threat, patch size, current occupancy and prevalence of cool microsites for Bay checkerspot butterflies.	Compliance monitoring and yearly reporting. Assess habitat quality of acquired land and prioritize areas for management according to threat, patch size, current occupancy and prevalence of cool microsites for Bay checkerspot butterflies.
	LAND-L5. Acquire in fee title or obtain easements on 2,900 acres of serpentine grassland along Coyote Ridge to link existing protected areas and to create a large core reserve for serpentine grassland species to move within (Linkage 6 in Table 5-9 and Figure 5-6). These acreages are inclusive of, not in addition to, acquisition targets set in LAND-G3.	Compliance monitoring for land acquisition. Analyze and quantify movement of indicator species to determine whether linkages are functioning as intended.
<b>Objective 11.2.</b> Increase the number of larval host plant populations and adult nectar sources and reduce the amount of thatch to a level that supports the long term viability of the Bay checkerspot butterfly on sites with degraded serpentine grassland within the Reserve System. <sup>2</sup>	GRASS-1. Continue or introduce livestock and native herbivore (e.g., elk) grazing in a variety of grazing regimes.	Monitor effects of various grazing regimes on increasing larval host plants and numbers of Bay checkerspot butterflies.
	GRASS-2. Conduct prescribed burns. Use targeted studies to inform methods, timing, location, and frequency.	Monitor effects of prescribed burns on increasing larval host plants and numbers of Bay checkerspot butterflies.
	GRASS-3. Conduct mowing in selected areas to mimic grazing where use of livestock is impractical.	Monitor effects of mowing on larval host plants, adult host plants, numbers of Bay checkerspot butterflies, and non-native invasive plant species.
<b>Objective 11.3</b> Decrease nitrogen deposition in serpentine grassland to reduce non-native, invasive plant growth in the Reserve System.	GRASS-4. Conduct selected seeding of native forbs and grasses in the Reserve System.	Monitor effects of mowing on larval host plants, adult host plants, numbers of Bay checkerspot butterflies, and non-native invasive plant species.
	GRASS-7. Implementing Entity will initiate translocation efforts if natural colonization fails after five seasons in which core populations are at above-average population sizes. Through coordination with species experts and regulatory agencies translocate Bay checkerspot butterflies (eggs, larvae, or adults) from core populations into suitable but unoccupied sites if natural dispersal fails to reestablish population.	Monitor at periodic intervals the success of translocation efforts in establishing new populations of Bay checkerspot butterfly.
	LM-11. Graze, mow, hand-pull, to reduce non-native invasive plant species, both terrestrial and aquatic, to a level where native plants can reestablish and remain dominant within the Reserve System.	Monitor relationship between nonnative plant abundance and Bay checkerspot butterfly.

Table 5-1c. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Goal 13.</b> Increase the size and sustainability of the breeding population and increase the distribution of breeding and wintering burrowing owls in the study area and the expanded burrowing owl conservation area.		
<b>Objective 13.1.</b> Protect 21,310 acres of modeled western burrowing owl overwintering habitat (i.e., grassland, oak woodland, or barren land) and protect or manage 5,300 acres of nesting habitat (occupied or potential) on the valley floor and in the Diablo Range within the permit area. The geographic breakdown should be: 3,700 acres in the North San Jose/Baylands region, 800 acres in the Gilroy region, 530 acres in the Morgan Hill region, and 270 acres in the South San Jose region as shown in Figure 5-10. Prioritize sites that contain occupied burrowing owl breeding sites. Management agreements on non-reserve lands may be placed on up to 4,700 acres of the 5,300 acres of nesting habitat.	LAND-G6. Acquire, obtain easements, or retain management agreements on burrowing owl nesting habitat within 2 miles the San Jose Water Pollution Control Plant Bufferlands, north of Highway 237.	Compliance monitoring and yearly reporting. Monitor presence/absence of burrowing owl in target areas.
	LAND-G7. Acquire, obtain easements, or retain management agreements on burrowing owl nesting habitat within 2 miles of the San Jose International Airport or other important northern San Jose breeding sites.	Compliance monitoring and yearly reporting. Monitor presence/absence of burrowing owl in target areas.
	LAND-G8. Acquire or obtain easements on 21,310 acres of suitable overwintering habitat in the Diablo Range that support ground squirrel populations or could support them with improved management. This acreage is in addition to of the targets identified in LAND-G6 and LAND-G7.	Compliance monitoring and yearly reporting. Monitor presence/absence of burrowing owl in target areas.
<b>Objective 13.2.</b> Enhance through improved management 3,700 acres of burrowing owl nesting habitat in the North San Jose/Baylands burrowing owl conservation region, 800 acres in the Gilroy burrowing owl conservation region, 530 acres in the Morgan Hill burrowing owl conservation region, and 270 acres in the South San Jose burrowing owl conservation region to encourage expansion of burrowing owls within the permit area. <sup>2</sup>	GRASS-5. Prohibit use of rodenticides within the Reserve System, except when needed to protect the integrity of structures, such as levees, stock ponds and dams.	Monitor population trend (i.e., number, density, range) of California ground squirrels in target areas.
	GRASS-6. Introduce livestock grazing where it is not currently used, and where conflicts with covered activities are minimized, to reduce vegetative cover and biomass that currently excludes ground squirrel and encourage ground squirrel colonization of new areas within the Reserve System.	Identify candidate grassland sites within the Reserve System to provide expansion areas for ground squirrel colonies.
	GRASS-8. Implement vegetation management (i.e., graze/mow) that reduces vegetation height and density to optimal conditions for burrowing owls.	Monitor status of burrowing owl population and correlate species response to vegetation management.
<b>Objective 13.3.</b> Establish a positive growth trend for burrowing owls in the permit area by Year 15 of the permit term and maintain the positive growth trend for each year thereafter.	GRASS-9. Create and maintain artificial burrows to encourage colonization of sites where ground squirrels establishment is not feasible or during the interim before ground squirrel colonies naturally establish.	Monitor artificial burrow for occupancy twice annually, during the breeding season.
	LAND-G6. Acquire, obtain easements, or retain management agreements on burrowing owl nesting habitat within 2 miles the San Jose Water Pollution Control Plant Bufferlands, north of Highway 237.	Compliance monitoring and yearly reporting. Monitor presence/absence of burrowing owl in target areas.
	LAND-G7. Acquire, obtain easements, or retain management agreements on burrowing owl nesting habitat within 2 miles of the San Jose International Airport or other important northern San Jose breeding sites.	Compliance monitoring and yearly reporting. Monitor presence/absence of burrowing owl in target areas.

Table 5-1c. Continued

	GRASS-8. Implement vegetation management (i.e., graze/mow) that reduces vegetation height and density to optimal conditions for burrowing owls.	Monitor status of burrowing owl population and correlate species response to vegetation management.
	GRASS-9. Create and maintain artificial burrows to encourage colonization of sites where ground squirrels establishment is not feasible or during the interim before ground squirrel colonies naturally establish.	Monitor artificial burrow for occupancy twice annually, during the breeding season.
<b>Goal 14.</b> Increase the ability of San Joaquin kit fox to move into and within the study area and provide habitat to increase the likelihood of breeding.		
<b>Objective 14.1.</b> Protect 4,100 acres of annual grassland and suitable oak woodland land cover types in a diversity of soils types and other environmental gradients to improve San Joaquin kit fox movement and potential breeding habitat as part of the Reserve System within the study area. <sup>1</sup>	LAND-G9. Acquire in fee title or obtain easements on 4,100 acres of annual grassland and suitable oak woodland types (e.g., oak savanna and oak woodland within 500 feet of annual grassland) north and south of Highway 152 in modeled San Joaquin kit fox habitat.	Compliance monitoring and yearly reporting. Monitor presence/absence of kit fox in target areas.
<b>Objective 14.2.</b> Increase the population size and density of the prey base for San Joaquin kit fox. <sup>2</sup>	GRASS-5. Prohibit use of rodenticides within the Reserve System, except when needed to protect the integrity of structures, such as levees, stock ponds and dams.	Monitor population trend (i.e., number, density, range) of California ground squirrels in target areas.
	GRASS-6. Introduce livestock grazing where it is not currently used, and where conflicts with covered activities are minimized, to reduce vegetative cover and biomass that currently excludes ground squirrel and encourage ground squirrel colonization of new areas within the Reserve System.	Identify candidate grassland sites within the Reserve System to provide expansion areas for ground squirrel colonies.

Table 5-1c. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 14.3.</b> Educate the public about land management techniques that are compatible with kit fox movement within the southeastern portion of the study area. <sup>2</sup>	GRASS-10. Conduct at least one public education campaign in the southeastern portion of the study area within the first 10 years of implementation to provide landowners with information about management and land use techniques that are more compatible with movement and use by San Joaquin kit fox. Conduct additional meetings as needed.	Ensure that at least one educational meeting is conducted within the first two years of implementation and then as needed after that.
<b>Objective 14.4.</b> Increase the number of undercrossings, by a minimum of one, that are considered passable and safe for San Joaquin kit fox or increase the safety of at least two existing crossings across Highway 152 between the Highway 152/156 interchange and the Santa Clara/Merced County line. Identify target crossings by conducting a feasibility study by year 5 of Plan implementation (see Objective 2.1). <sup>2, 3</sup>	LM-1. Remove fences and private roads in areas where they are no longer needed and where their removal could increase the permeability of the study area for wildlife.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
	LM-2. When replacing small culverts ensure that the culvert has a natural bottom and is large enough for larger mammals such as deer and mountain lions to pass, if feasible. Culverts must provide direct movement from one side of the road to the other and ensure that the culvert is visible to the target species (i.e., do not obscure entrance with vegetation). Install fencing or other features that will direct wildlife towards the culvert or other safe crossing within the first 20 years of implementation.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
	LM-3. Where structurally possible, replace culverts with free span bridges to ensure free movement for wildlife under roadways.	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
	LM-4. Ensure that median barrier removal and/or median perforations are considered as alternatives during project design.	Monitor wildlife movement in target areas. Monitor movement of indicator species for connectivity.
	LM-5. Remove median barriers or perforate sections of median barriers along roadways to improve successful wildlife crossings and install fencing or other features to direct wildlife to those open sections within first 20 years of implementation. Use feasibility study to determine location and length of barrier removal.	Compliance monitoring. Monitor wildlife movement in target areas. Monitor movement of indicator species for connectivity.

Table 5-1c. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Goal 15.</b> Provide for the expansion of a breeding population of least Bell's vireos into the study area and increase reproductive success of least Bell's vireo.		
<b>Objective 15.1.</b> Protect 462 acres of modeled Least Bell's vireo habitat (i.e., riparian woodland or forest with a dense understory (<3m tall) in the Uvas, Llagas, Pajaro, or Pacheco Watersheds in south Santa Clara County) as part of the Reserve System. <sup>1</sup> Target areas will contain occupied or potential least Bell's vireo habitat.	LAND-R1. Extend the Uvas Creek Park Preserve 1.6 miles upstream to Hecker Pass Highway and setback expected development adjacent to this stream segment by a minimum of 100 feet to protect the Uvas Creek Corridor consistent with Goals 5-5, 5-7, and 5-8 of the approved City of Gilroy Hecker Pass Specific Plan. Target acquisitions will contribute to the protection of a total of 800 acres of riparian woodland and forest in the Uvas, Llagas, and Pacheco watersheds.	Compliance monitoring and yearly reporting. Assess habitat quality of acquired land and prioritize areas for management.
<b>Objective 15.2.</b> Restore a minimum of 50 acres of riparian woodland and forest and up to 339 acres in the Uvas, Llagas, or Pacheco Watersheds within the Reserve System. <sup>2</sup> Target areas that contain occupied or potential least Bell's vireo habitat.	LM-11. Graze, mow, hand-pull, to reduce non-native invasive plant species, both terrestrial and aquatic, to a level where native plants can reestablish and remain dominant within the Reserve System.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
	STREAM-2. Plant and/or seed in native understory and overstory riparian vegetation within 15 feet of the edge of the low-flow channel to create structural diversity, provide overhead cover, and moderate water temperature at all riparian restoration sites.	Monitor survivorship of plantings/seedlings as part of restoration and enhancement efforts and periodically survey for species response from least Bell's vireo, yellow-legged frog and other covered species.
	STREAM-3. Plant and/or seed in native riparian vegetation in gaps in existing riparian corridors, or re-establish severely degraded or historic riparian corridors, to promote continuity within conservation lands.	Monitor survivorship of plantings/seedlings as part of restoration and enhancement efforts and periodically survey for species response from least Bell's vireo, yellow-legged frog and other covered species.
	STREAM-4. Replace concrete, earthen or other engineered channels as part of the 10.4 miles of stream restoration to restore floodplain connectivity. Location and length will be determine by site-specific conditions.	Compliance monitoring. Conduct pre- and post-treatment monitoring of riparian vegetation as part of a targeted study.
	STREAM-5. Replace confined channels to restore floodplain connectivity and commensurate functions as part of the 10.4 miles of stream restoration. Location and length will be determine by site-specific conditions.	Compliance monitoring. Conduct pre- and post-treatment monitoring of riparian vegetation as part of a targeted study.
<b>Objective 15.3.</b> Reduce the abundance of nest predators in target areas (i.e., occupied and potential habitat) in order to increase reproductive success of least Bell's vireo in riparian areas within the Reserve System. <sup>2</sup>	STREAM-7. Implement a brown-headed cowbird control program in coordination with species experts and regulatory agencies that will reduce the impact of brood parasitism on least Bell's vireo nest success, if least Bell's vireos become regular nesters in the study area (>3 nests over at least two consecutive years) and brown-headed cowbird eggs are discovered in vireo nests.	Compliance monitoring. Monitor for riparian song bird nesting within least Bell's vireo modeled habitat. Periodically, every 5 years, monitor for least Bell's vireo outside of modeled habitat to document range expansion. Quantify the number of occurrences of brood parasitism that are occurring and if/when brown-headed cowbird control program is initiated and efficacy of program.

Table 5-1c. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Goal 16.</b> Conserve existing populations of the foothill yellow-legged frog population where possible and increase the overall population of foothill yellow-legged frog in biologically appropriate locations in the study area.		
<b>Objective 16.1.</b> Protect 104 stream miles of modeled foothill yellow-legged frog habitat that currently have, or historically had, perennial flows as part of the Reserve System within the study area. <sup>1</sup> Target streams that contain occupied or potential foothill yellow-legged frog habitat.	LAND-R5. Acquire or obtain easements along 104 miles of perennial streams located above Uvas, Calero, Chesbro, Anderson, or in Uvas Creek below Uvas Reservoir, Upper Penitencia Creek, Alamitos Creek or Guadalupe Creek that have or could be restored to have cobblestone substrate and consistent, gentle flows from late March to late May.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
<b>Objective 16.2.</b> Enhanced all acquired stream miles and restore 10.4 stream miles of perennial streams located above Uvas, Calero, Chesbro, Anderson, or Coyote Reservoirs or in Uvas Creek below Uvas Reservoir, Upper Penitencia Creek, Alamitos Creek or Guadalupe Creek. <sup>2</sup> Target streams that contain occupied or potential foothill yellow-legged frog habitat.	LM-14. Selectively apply herbicides or other treatments to invasive plants.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
	STREAM-2. Plant and/or seed in native understory and overstory riparian vegetation within 15 feet of the edge of the low-flow channel to create structural diversity, provide overhead cover, and moderate water temperature at all riparian restoration sites.	Monitor survivorship of plantings/seedlings as part of restoration and enhancement efforts and periodically survey for species response from least Bell's vireo, yellow-legged frog and other covered species.
	STREAM-4. Replace concrete, earthen or other engineered channels as part of the 10.4 miles of stream restoration to restore floodplain connectivity. Location and length will be determine by site-specific conditions.	Compliance monitoring. Conduct pre- and post-treatment monitoring of in-stream habitat as part of a targeted study.
	STREAM-5. Replace confined channels to restore floodplain connectivity and commensurate functions as part of the 10.4 miles of stream restoration. Location and length will be determine by site-specific conditions.	Compliance monitoring. Conduct pre- and post-treatment monitoring of floodplain function as part of a targeted study.
	STREAM-8. Increase the amount of cobblestone substrate suitable to support breeding foothill yellow-legged frogs to 2,000 ft. to areas close to known occurrence(s) of foothill yellow-legged frog or immediately upstream or downstream of known occurrences or other high quality foothill yellow-legged frog breeding habitat.	Assess yellow-legged frog response to increase in cobblestone substrate as part of a targeted study.
	STUDIES-6. Conduct a directed study to censuses egg masses in breeding habitat downstream of reservoirs before and after releases to determine whether eggs masses were lost.	Monitor effects of pulse flows on foothill yellow-legged frog.

Table 5-1c. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Goal 17:</b> Conserve existing populations of California red-legged frog, California tiger salamander, and western pond turtle populations where possible, and increase the number of individuals and expand the overall distribution of populations of these species in biologically appropriate locations within the study area to maintain viable populations and contribute to the regional recovery of these species.		
<b>Objective 17.1.</b> Protect California red-legged frog modeled primary (1,430 acres) and secondary (41,800) habitat, California tiger salamander modeled breeding (195 acres) and non-breeding (41,700 acres) habitat, and western pond turtle primary (9,800 acres) and secondary (29,100 acres) habitat as part of the Reserve System within the study area. Aquatic habitat will only be protected if adjacent upland habitat suitable for the terrestrial needs of these species are also protected. <sup>1, 4</sup>	LAND-WP4. Acquire habitat that is adjacent to permanently protected aquatic resources with a high potential to support CRLF and is in the East San Francisco Bay Recovery Unit for red-legged frog ( <i>USFWS 2002</i> ) (Coyote Creek, Pacheco, and Pescadero Watersheds).	Compliance monitoring and yearly reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-WP5. Acquire habitat that contains a matrix of aquatic and upland habitats and is also adjacent to Joseph D. Grant County Park, Palassou Ridge Open Space Preserve, southeast of Henry Coe State Park, Santa Cruz Mountain foothills, and Calero County Park in areas where dense forest is absent to reduce competition with other native amphibians (e.g., California newts).	Compliance monitoring and yearly reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-WP6a. Acquire stream segments or ponds that currently provide or could provide high quality basking, breeding, and nesting habitat (vegetated banks and at least 150 feet of adjacent upland habitat) for western pond turtle.	Compliance monitoring and yearly reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-WP6b. Acquire stream segments or ponds that currently provide or could provide high quality basking, breeding, and nesting habitat (vegetated banks and at least 0.5 miles of adjacent upland habitat) for California tiger salamander.	Monitor the removal of barriers within the reserve system to ensure that the highest priority barriers are removed first. Analyze and quantify any potential positive (native fish movement) and negative (spread of exotic species) effects of barrier removal during targeted study phase of implementation.
<b>Objective 17.2.</b> Protect corridors between existing protected areas to ensure genetic exchange within and movement between populations of covered amphibians and aquatic reptiles as part of the Reserve System within the study area. <sup>1</sup> Target corridors include Linkages 4, 5, 12, 13, 14, 15, and 16 (Table 5-6, Figure 5-6).	LAND-WP7. Acquire habitat near Santa Teresa Hills and Tulare Hill to provide connectivity between populations in the Diablo Range and the Santa Cruz foothills.	Compliance monitoring and yearly reporting. Assess habitat quality of acquired land and prioritize areas for management.
	LAND-G2. Acquire 13,300 acres of annual grassland by fee title or conservation easement as part of the Reserve System. Target areas on both sides of Santa Clara Valley with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored. Acquisition of native grassland will be given priority.	Compliance monitoring and yearly reporting. Assess use by covered amphibians and aquatic reptiles and experimentally manage to improve habitat for movement.

Table 5-1c. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
	LAND-OC1. Acquire in fee title or obtain conservation easements on 7,100 acres of mixed oak woodland and forest, including land in both the Santa Cruz Mountains and the Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	Compliance monitoring and yearly reporting. Assess use by covered amphibians and aquatic reptiles and experimentally manage to improve habitat for movement.
	LAND-OC2. Acquire 2,900 acres of coast live oak woodland and forest by fee title or conservation easement, including land in both the Santa Cruz Mountains and the Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	Compliance monitoring and yearly reporting. Assess use by covered amphibians and aquatic reptiles and experimentally manage to improve habitat for movement.
	LAND-OC3. Acquire 1,100 acres of blue oak woodland and 1,700 acres of valley oak woodland by fee title or conservation easement including land in both the Santa Cruz Mountains and the Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	Compliance monitoring and yearly reporting. Assess use by covered amphibians and aquatic reptiles and experimentally manage to improve habitat for movement.
	LAND-OC4. Acquire 80 acres of foothill pine-oak woodland and forest by fee title or conservation easement, including land in both the Santa Cruz Mountains and Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	Compliance monitoring and yearly reporting. Assess use by covered amphibians and aquatic reptiles and experimentally manage to improve habitat for movement.
	LAND-OC5. Acquire 20 acres of mixed evergreen forest by fee title or conservation easement including land in both the Santa Cruz Mountains and Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	Compliance monitoring and yearly reporting. Assess use by covered amphibians and aquatic reptiles and experimentally manage to improve habitat for movement.
<b>Objective 17.3.</b> Enhance a minimum of 50 acres of ponds, 15 acres of wetlands, and 100 miles of streams in the Reserve System by eradicating or reducing exotic species and competitor species (such as nonnative pet-store turtles) that are detrimental to covered amphibians, aquatic reptiles, and native pond biodiversity. Enhance up to 104 acres of ponds and 80 acres of wetlands if all estimated impacts occur. <sup>2</sup>	LM-12. Eradicate or reduce nonnative pig disturbance within the Reserve System through trapping, hunting, or other control methods. Success criteria is achieved through ensuring disturbances by nonnative pigs do not impair the ability of the Reserve System from meeting the biological goals and objectives.	Conduct surveys every 5 years in areas of traditionally high feral pig populations to determine what the population levels are relative to baseline. Monitor response of California red-legged frog, California tiger salamander, and western pond turtle to control of exotic and competitor species as part of a targeted study.
	LM-13. Eradicate or reduce nonnative predators (bullfrogs, invasive fish, feral cats) within the Reserve System through habitat manipulation (e.g., periodic draining of ponds), trapping, hand capturing, electroshocking or other control methods to achieve targets identified in reserve unit management plans.	Monitor response of nonnative predators to habitat manipulation. Monitor response of California red-legged frog, California tiger salamander, and western pond turtle to control of exotic and competitor species

Table 5-1c. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
	STREAM-1. Exclude livestock access to target stream segments (e.g., Pacheco Creek, floodplain of Coyote Creek) using exclusion fencing, off-channel water sources, and other potential actions.	Conduct pre- and post-treatment monitoring to document vegetation and covered-species response to exclusion.
	STREAM-2. Plant and/or seed in native understory and overstory riparian vegetation within 15 feet of the edge of the low-flow channel to create structural diversity, provide overhead cover, and moderate water temperature at all riparian restoration sites.	Monitor the efficacy of seeding efforts with respect to structural diversity, overhead cover, and water temperature compared to designated reference locations. Indicator species will be selected and success criteria developed for large-scale restoration projects from the reference locations.
	STREAM-3. Plant and/or seed in native riparian vegetation in gaps in existing riparian corridors, or re-establish severely degraded or historic riparian corridors, to promote continuity within conservation lands.	STREAM-4. Plant and/or seed in native riparian vegetation in gaps in existing riparian corridors to promote continuity.
	POND-11. Offer financial and regulatory (Safe Harbor Agreement) incentives to private landowners to enhance pond and wetland habitat to suit breeding California red-legged frog, California tiger salamander, and western pond turtle.	Compliance monitoring.
	POND-12. Educate the public that the use of any salamander species as bait is illegal in the State of California.	Compliance monitoring.
	<b>Objective 17.4.</b> Restore a minimum of 20 acres of perennial wetlands and 1 mile of streams for the California red-legged frog, California tiger salamander, and western pond turtle to maintain or increase breeding populations of covered amphibians and reptiles. Restore up to 45 acres of perennial wetlands, 30 acres of seasonal wetlands, and 10.4 miles of streams if all estimated impacts occur. <sup>2</sup>	
	POND-1. Install fencing that will reduce grazing pressure and exclude feral pigs on portions of ponds and wetlands and provide vegetated refuge sites for covered species. Fence installation will be carefully applied to avoid negative impacts on small mammal movement and upland habitat.	Conduct pre- and post-treatment monitoring to document vegetation and covered-species response to exclusion.
	POND-2. Install woody debris around perimeter and in submerged banks of ponds and wetlands to create basking habitat and cover for native juvenile amphibians and turtles. Materials imported from outside of the watershed shall be treated for chytrid and other potential pathogens prior to installation.	Analyze and quantify effectiveness of created basking site through routine monitoring in ponds with known western pond turtle occupancy.
	POND-3. Plant native emergent vegetation around the perimeter and in ponds and wetlands.	Monitor survivorship of planting, quantify vegetated perimeter of pond, describe habitat quality and periodically survey for species response from covered amphibians and reptiles. Evaluate success of wetland and pond enhancement using established success criteria.
	POND-4. Clear vegetation and/or remove sediment in a way that minimizes negative effects on covered species when vegetation and/or sediment restricts the ability of the aquatic environment from meeting the biological goals and objectives of the Plan.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.

Table 5-1c. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
	POND-13. Excavate sections of ponds to provide deeper pools that will be utilized by California red-legged frog adults and sub-adults and western pond turtles, while maintaining shallow areas to provide rearing habitat for California red-legged frog tadpoles, California tiger salamander larvae, and western pond turtle hatchlings.	Monitor use of excavated pond by red-legged frog and western pond turtles as part of a targeted study.
	STUDIES-7. In the case of ponds, wetlands, and/ or amphibian populations becoming infected with chytrid fungus or other diseases, use the best scientific information available to manage and stop spread of epidemic.	Monitor for the presence of disease. Monitor efficacy of disease control actions.
	STUDIES-8. Identify the distribution and risk to existing indigenous populations of covered amphibians and reptiles from hybridization (e.g., California tiger salamander hybridizing with Texas salamander) within the Reserve System. Appendix K, California Tiger Salamander Hybridization, will serve as the Management Plan for CTS hybridization issues and will be updated throughout the permit term for adaptive management purposes.	Monitor for the presence of non-natives and hybrids. Test and document efficacy of management plan.
	STUDIES-9. Annually identify and maintain upland breeding sites (even if sites are not “natural”) for western pond turtle because of the high fidelity of use from year to year .	Monitor use of protected sites to determine factors influencing nest success in areas of known turtle use.
	GRASS-1. Continue or introduce livestock and native herbivore (e.g., elk) grazing in a variety of grazing regimes.	Monitor effects of various grazing regimes on increasing habitat for red-legged frog, western pond turtle and California tiger salamander
	GRASS-2. Conduct prescribed burns. Use targeted studies to inform methods, timing, location, and frequency.	Monitor effects of prescribed burning on increasing habitat for red-legged frog, western pond turtle and California tiger salamander
	LM-11. Graze, mow, hand-pull, to reduce non-native invasive plant species, both terrestrial and aquatic, to a level where native plants can reestablish and remain dominant within the Reserve System.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
	LM-14. Selectively apply herbicides or other treatments to invasive plants.	Monitor effects of herbicide application on reducing nonnative species and ensure that herbicide use has no unwanted effects on native amphibian population.

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 17.5.</b> Create a minimum of 20 acres of ponds to provide new breeding sites for California red-legged frog, California tiger salamander, and western pond turtle within the Reserve System. Create up to 72 acres of ponds if all estimated impacts occur. <sup>2</sup>	POND-1. Install fencing that will reduce grazing pressure and exclude feral pigs on portions of ponds and wetlands and provide vegetated refuge sites for covered species. Fence installation will be carefully applied to avoid negative impacts on small mammal movement and upland habitat.	Monitor pond creation and assess whether success criteria are being met. Monitor use of created ponds by covered amphibians and western pond turtle.
	POND-2. Install woody debris around perimeter and in submerged banks of ponds and wetlands to create basking habitat and cover for native juvenile amphibians and turtles. Materials imported from outside of the watershed shall be treated for chytrid and other potential pathogens prior to installation.	Analyze and quantify effectiveness of created basking site through routine monitoring in ponds with known western pond turtle occupancy.
	POND-3. Plant native emergent vegetation around the perimeter and in ponds and wetlands.	Monitor survivorship of planting, quantify vegetated perimeter of pond, describe habitat quality and periodically survey for species response from covered amphibians and reptiles. Evaluate success of wetland and pond enhancement using established success criteria.
	POND-4. Clear vegetation and/or remove sediment in a way that minimizes negative effects on covered species when vegetation and/or sediment restricts the ability of the aquatic environment from meeting the biological goals and objectives of the Plan.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
	POND-9. Create at least 20 acres of ponds at 40 sites, at least 10 sites in the Santa Cruz Mountains and 20 sites in the Diablo Range.	Monitor pond creation and assess whether success criteria are being met. Monitor use of created ponds by covered amphibians and western pond turtle.
	POND-10. In addition to the creation of ponds described in POND-9, create up to 52 acres of ponds in-kind within the Reserve System to increase the amount available habitat and enhance connectivity among existing ponds and wetlands if all anticipated impacts occur. <sup>3</sup>	Monitor pond creation and assess whether success criteria are being met. Monitor use of created ponds by covered amphibians and western pond turtle.
	POND-11. Offer financial and regulatory (Safe Harbor Agreement) incentives to private landowners to enhance pond and wetland habitat to suit breeding California red-legged frog, California tiger salamander, and western pond turtle.	Compliance monitoring.
	POND-13. Excavate sections of ponds to provide deeper pools that will be utilized by California red-legged frog adults and sub-adults and western pond turtles, while maintaining shallow areas to provide rearing habitat for California red-legged frog tadpoles, California tiger salamander larvae, and western pond turtle hatchlings.	Monitor use of excavated pond by red-legged frog and western pond turtles as part of a targeted study.
	STUDIES-7. In the case of ponds, wetlands, and/ or amphibian populations becoming infected with chytrid fungus or other diseases, use the best scientific information available to manage and stop spread of epidemic.	Monitor for the presence of disease. Monitor efficacy of disease control actions.

Table 5-1c. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
	STUDIES-8. Identify the distribution and risk to existing indigenous populations of covered amphibians and reptiles from hybridization (e.g., California tiger salamander hybridizing with Texas salamander) within the Reserve System. Appendix K, California Tiger Salamander Hybridization, will serve as the Management Plan for CTS hybridization issues and will be updated throughout the permit term for adaptive management purposes.	Monitor for the presence of non-natives and hybrids. Test and document efficacy of management plan.
	STUDIES-9. Annually identify and maintain upland breeding sites (even if sites are not “natural”) for western pond turtle because of the high fidelity of use from year to year .	Monitor use of protected sites to determine factors influencing nest success in areas of known turtle use.
	GRASS-1. Continue or introduce livestock and native herbivore (e.g., elk) grazing in a variety of grazing regimes.	Monitor effects of various grazing regimes on increasing habitat for red-legged frog, western pond turtle and California tiger salamander
	GRASS-2. Conduct prescribed burns. Use targeted studies to inform methods, timing, location, and frequency.	Monitor effects of prescribed burning on increasing habitat for red-legged frog, western pond turtle and California tiger salamander
	LM-11. Graze, mow, hand-pull, to reduce non-native invasive plant species, both terrestrial and aquatic, to a level where native plants can reestablish and remain dominant within the Reserve System.	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
	LM-14. Selectively apply herbicides or other treatments to invasive plants.	Monitor effects of herbicide application on reducing nonnative species and ensure that herbicide use has no unwanted effects on native amphibian population.
<b>Goal 18.</b> Increase the population size of tricolored blackbird to enhance the viability of the species in the study area.		
<b>Objective 18.1.</b> Protect and enhance at least 4 tricolored blackbird breeding sites that support, historically supported, or could support tricolored blackbird colonies as part of the Reserve System within the study area. <sup>1</sup> Each site must include at least 2-acres of breeding habitat and have foraging habitat within 2 miles.	LAND-WP8. Acquire in fee title or through a conservation easement at least 4 tricolored blackbird breeding sites that support, historically supported, or could support tricolored blackbird colonies each with at least 2-acres of breeding habitat and foraging habitat within 2 miles. Target at least 5 acres of suitable breeding habitat for tricolored blackbird within dry land farming or ranching complexes in the Santa Clara Valley and the Diablo Range	Compliance monitoring and yearly reporting. Assess habitat quality of acquired land and prioritize areas for management.
	POND-14. Offer financial or regulatory incentives (Safe Harbor Agreement, if listed) to private landowners to enhance pond and marsh habitat to suit breeding tricolored blackbirds, and to ensure that dry-land farming and ranching activities support breeding tricolored blackbirds.	Compliance Monitoring.

Table 5-1c. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 18.2.</b> Protect and enhance 200 acres of suitable tricolored blackbird foraging habitat within 2 miles of protected and occupied breeding sites as part of the Reserve System within the study area. <sup>1</sup>	LAND-WP9. Acquire 200 acres of foraging habitat for tricolored blackbird in areas where there are protected breeding sites within 2 miles.	Compliance monitoring and yearly reporting. Monitor presence/absence of foraging habitat.
	POND-15 Offer financial incentives to private landowners to ensure that dry-land farming and ranching activities support foraging tricolored blackbirds.	Compliance Monitoring.
<b>Objective 18.3.</b> Enhance or restore 5 acres of suitable tricolor blackbird breeding habitat in historically/currently occupied areas within the Reserve System. <sup>2</sup>	POND-1. Install fencing that will reduce grazing pressure and exclude feral pigs on portions of ponds and wetlands and provide vegetated refuge sites for covered species. Fence installation will be carefully applied to avoid negative impacts on small mammal movement and upland habitat.	Conduct pre- and post-treatment monitoring to document vegetation and covered-species response to exclusion.
	POND-16. Restore freshwater marsh, seasonal wetlands, and/or ponds that will support dense reed-like vegetation (cattails) or other native vegetation that will attract nesting tricolored blackbirds.	Compliance monitoring. Monitor habitat restoration and assess whether success criteria are being met. Monitor use of restored habitat by tricolored blackbird.
	POND-17. In areas with non-native vegetation (e.g., Himalayan blackberry) that supports existing tricolored blackbird colonies, initiate a gradual (3-4 year) transition from non-native vegetation to native vegetation that is structurally similar.	Determine areas where tricolored blackbirds are using non-native vegetation and ensure that there is a management plan in place to control the spread of the non-native vegetation and transition the colony to native vegetation if necessary.
	POND-18. Restore up to 30 acres of seasonal wetlands within the Reserve System in the Santa Clara Valley.	Compliance monitoring. Monitor habitat restoration and assess whether success criteria are being met. Monitor use of restored habitat by tricolored blackbird.
	STREAM-4. Replace concrete, earthen or other engineered channels as part of the 10.4 miles of stream restoration to restore floodplain connectivity. Location and length will be determine by site-specific conditions.	Compliance monitoring. Conduct pre- and post-treatment monitoring of riparian vegetation as part of a targeted study.
<b>Objective 18.4.</b> Restore a minimum of 20 acres of freshwater wetland suitable for tricolored blackbird breeding habitat within 2 miles of suitable and foraging habitat to encourage colonization of new sites within the Reserve System. Restore up to 45 acres of freshwater wetlands if all estimated impacts occur. <sup>2</sup> The acreage targets in this objective are inclusive of targets identified in Objective 20.3.	POND-19. Restore a minimum of 20 acres and up to 45 acres of freshwater marsh within the Reserve System in the Santa Cruz Mountains, Santa Clara Valley, and Diablo Range.	Compliance monitoring. Monitor habitat restoration and assess whether success criteria are being met. Monitor use of restored habitat by tricolored blackbird.

Table 5-1c. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 18.5.</b> Create a minimum of 20 acres of ponds to provide new nest colony sites for tricolored blackbird within the Reserve System. Create up to 72 acres of ponds if all estimated impacts occur. <sup>2</sup>	POND-9. Create at least 20 acres of ponds at 40 sites, at least 10 sites in the Santa Cruz Mountains and 20 sites in the Diablo Range.	Monitor pond creation and assess whether success criteria are being met. Monitor use of created ponds by covered amphibians, western pond turtle, and tricolored blackbird.
	POND-10. In addition to the creation of ponds described in POND-9, create up to 52 acres of ponds in-kind within the Reserve System to increase the amount available habitat and enhance connectivity among existing ponds and wetlands if all anticipated impacts occur. <sup>3</sup>	Monitor pond creation and assess whether success criteria are being met. Monitor use of created ponds by covered amphibians, western pond turtle, and tricolored blackbird.

## Notes:

<sup>1</sup> Land acquisition must occur in rough step with impacts as required by the Stay-Ahead provision (see Chapter 8, Section 8.6.1). All land acquisition must be completed by Year 45. Section 5.4 of the Plan provides more detail on areas targeted for acquisition for each species. Reserve lands will be managed in accordance with reserve unit management plans, completed within 5 years of the acquisition of the 1st parcel within the reserve unit.

<sup>2</sup> Habitat enhancement, monitoring, and adaptive management program, will continue in perpetuity. Restoration and creation must occur in rough step with impacts as required by the Stay Ahead provision (see Chapter 8, Section 8.6.1). All habitat restoration will be completed by year 40 unless otherwise noted in this table. Reserve lands will be managed in accordance with reserve unit management plans, completed within 5 years of the acquisition of the 1st parcel within the reserve unit. All plans will be reviewed and approved by the Wildlife Agencies. The conservation strategy for aquatic land cover types includes preservation/enhancement, restoration, and/or creation. See Tables 5-14 and 5-15 for details.

<sup>3</sup> Design will be based on the best available science and be consistent with Condition 6 described in Chapter 6, Section 6.4.4, subheading *Condition 6 Design and Construction Requirements for Covered Transportation Projects*

<sup>4</sup> These occupied acreages are minimum requirements for each species that utilizes each referenced land cover type.

**Table 5-1d. Biological Goals, Objectives and Conservation Actions: Plants**

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Goal 20.</b> Maintain viability, protect, and increase the size and number of populations of covered serpentine plant species, including Coyote ceanothus, Santa Clara Valley dudleya, Metcalf Canyon jewelflower, most beautiful jewelflower, smooth lessingia, fragrant fritillary, Mt. Hamilton thistle, Loma Prieta hoita, and Tiburon Indian paintbrush, within the study area. <sup>1</sup>		
<b>Objective 20.1.</b> Protect and enhance the known extant occurrences of Coyote ceanothus as part of the Reserve System within the study area, including a buffer zone of 500 feet around each occurrence to reduce external influences and a minimum occurrence size of 5,000 individuals. <sup>4,5,7</sup>	LAND-P1. Acquire in fee title or conservation easement sites in the study area that support three unprotected occurrences of Coyote ceanothus and provide the necessary buffer between incompatible land uses.	Compliance monitoring and annual reports.
	STUDIES-5. Conduct targeted studies to determine factors limiting the expansion of the covered plant species, including but not limited to its management and micro-site needs, and implement measures to mitigate or eliminate these factors to promote occurrence expansion.	Monitor results of research and the effects of its application.
	STUDIES-11. Conduct experimental burning in protected occurrences of targeted covered plant species to determine the importance of fire for plant regeneration.	Monitor burning on known occurrences of Coyote ceanothus and species response.
	STUDIES-12. Ensure seeds from natural occurrences in the Study Area are stored and maintained at a minimum of one Center for Plant Conservation certified botanic garden.	Monitor viability of seed collection and refresh collection, as necessary.
	CHAP-1. Conduct prescribed burns in chaparral and northern coastal scrub to maintain canopy gaps and promote regeneration. Use targeted studies to inform locations and frequency.	Monitor burning on known occurrences of Coyote ceanothus and species response.
	CHAP-2. Mechanically thin chaparral and northern coastal scrub to promote structural diversity. Use targeted studies to inform location and frequency.	Monitor the impacts of grazing or other vegetation management techniques on known occurrences of Coyote ceanothus.
	LM-8. Negotiate with Cal Fire and other local fire-fighting agencies the use of management response measures for all fire events and fire-dependent ecosystems that minimize impacts to natural communities and covered species while protecting human life and property. All burns will be responded to, and prescribed burns will be conducted, with minimum impact suppression tactics. Burn response will take into consideration ignition location and method, seasonality, weather and availability of suppression forces.	Monitor all covered plants following a wildfire.

Table 5-1d. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 20.2.</b> Establish two new occurrences of Coyote ceanothus in the Reserve System to reduce risk of extinction. Conduct targeted studies to determine feasibility of occurrence creation and identify locations and propagation/planting techniques. <sup>6</sup>	STUDIES-13. Identify suitable locations for and establish target number of new covered plant occurrences in the Reserve System.	Compliance monitoring and annual reports.
	STUDIES-14. Determine suitable propagation or planting techniques for targeted covered plant species and determine biologically appropriate seed sampling techniques from existing occurrences.	Monitor newly established and source occurrences.
	STUDIES-15. Design and implement field experiments (if the number of propagules will not be significantly impacted) to test alternative techniques for establishment of targeted covered plant occurrences. Field experiments will be continue until target number of occurrences are established.	Monitor the results of all experiments.
<b>Objective 20.3.</b> Protect at least 55 occurrences of Santa Clara Valley dudleya as part of the Reserve System within the study area, including a buffer zone of 500 feet around each occurrence to reduce external influences and promote expansion of occurrences. <sup>2,4,5</sup>	LAND-P2. Acquire in fee title or conservation easement sites in the study area that support 55 occurrences of Santa Clara Valley dudleya across a range of elevational gradients on both sides of Coyote Valley to ensure geographic diversity in protected occurrences.	Compliance monitoring and annual reports.
	STUDIES-12. Ensure seeds from natural occurrences in the Study Area are stored and maintained at a minimum of one Center for Plant Conservation certified botanic garden.	Monitor viability of seed collection and refresh collection, as necessary.
<b>Objective 20.4.</b> Increase the size of Santa Clara Valley dudleya occurrences to ensure each occurrence has at least 2,000 individuals within the Reserve System. <sup>4,6,7</sup>	STUDIES-5. Conduct targeted studies to determine factors limiting the expansion of the covered plant species, including but not limited to its management and micro-site needs, and implement measures to mitigate or eliminate these factors to promote occurrence expansion.	Monitor the results and application of research on Santa Clara Valley dudleya
	STUDIES-16. Monitor the effects of livestock grazing (or predation by other species, e.g., black-tailed jackrabbit) on targeted covered plant species by conducting exclusion experiments and monitoring effects on occurrences, including control sites in the monitoring plan.	Monitor the effects of grazing on management on covered plant species.

Table 5-1d. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 20.5.</b> Protect at least three currently unprotected occurrences and adequate lands to create ten new occurrences of Metcalf Canyon jewelflower, including a buffer zone of 500 feet around each occurrence to reduce external influences and promote expansion of occurrences. <sup>4,5</sup>	LAND-P3. Acquire in fee title or conservation easement sites in the study area that support three occurrences of Metcalf Canyon jewelflower.	Compliance Monitoring; Yearly Reports
	STUDIES-12. Ensure seeds from natural occurrences in the Study Area are stored and maintained at a minimum of one Center for Plant Conservation certified botanic garden.	Monitor viability of seed collection and refresh collection, as necessary.
<b>Objective 20.6.</b> Create at least ten new occurrences and expand the size of all Metcalf Canyon jewelflower occurrences in the Reserve System to at least 2,000 individuals. <sup>4,6,7</sup>	LAND-P4. Acquire north side of Tulare Hill to promote reintroduction of Metcalf Canyon jewelflower on west side of Valley.	Compliance Monitoring; Yearly Reports
	STUDIES-5. Conduct targeted studies to determine factors limiting the expansion of the covered plant species, including but not limited to its management and micro-site needs, and implement measures to mitigate or eliminate these factors to promote occurrence expansion.	Monitor the results and application of research on Metcalf Canyon jewelflower
	STUDIES-14. Determine suitable propagation or planting techniques for targeted covered plant species and determine biologically appropriate seed sampling techniques from existing occurrences.	Monitor newly established and source occurrences.
	STUDIES-15. Design and implement field experiments (if the number of propagules will not be significantly impacted) to test alternative techniques for establishment of targeted covered plant occurrences. Field experiments will be continue until target number of occurrences are established.	Monitor the results of all experiments.
	STUDIES-17. Monitor Metcalf Canyon jewelflower and most beautiful jewelflower introgression and develop protocols to protect the genetic integrity of both species.	Monitor the results of research and success of developed protocols.
<b>Objective 20.7.</b> Protect at least 17 occurrences of most beautiful jewelflower, including a buffer zone of 500 feet around each occurrence to reduce external influences and promote expansion of occurrence. <sup>4,5</sup>	LAND-P5. Acquire sites in the study area that support 17 occurrences of most beautiful jewelflower.	Compliance monitoring and annual reports.
	STUDIES-12. Ensure seeds from natural occurrences in the Study Area are stored and maintained at a minimum of one Center for Plant Conservation certified botanic garden.	Monitor viability of seed collection and refresh collection, as necessary.

Table 5-1d. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
	STUDIES-17. Monitor Metcalf Canyon jewelflower and most beautiful jewelflower introgression and develop protocols to protect the genetic integrity of both species.	Monitor the results of research and success of developed protocols.
<b>Objective 20.8.</b> Increase the size of most beautiful jewelflower occurrences to ensure each occurrence has at least 2,000 individuals. <sup>4,6,7</sup>	STUDIES-5. Conduct targeted studies to determine factors limiting the expansion of the covered plant species, including but not limited to its management and micro-site needs, and implement measures to mitigate or eliminate these factors to promote occurrence expansion.	Monitor the results and application of research on most beautiful jewelflower
	STUDIES-14. Determine suitable propagation or planting techniques for targeted covered plant species and determine biologically appropriate seed sampling techniques from existing occurrences.	Monitor newly established and source occurrences.
<b>Objective 20.9.</b> Protect at least 22 occurrences of Mount Hamilton thistle as part of the Reserve System within the study area, including a buffer zone of 500 feet around each occurrence to reduce external influences and promote expansion of occurrence. <sup>3,4,5</sup>	LAND-P6. Acquire sites in the study area that support Mount Hamilton thistle in drainages or spring systems and stratify protection on both sides of Coyote Valley to ensure geographic diversity in protected occurrences.	Compliance monitoring and annual reports.
	STUDIES-12. Ensure seeds from natural occurrences in the Study Area are stored and maintained at a minimum of one Center for Plant Conservation certified botanic garden.	Monitor viability of seed collection and refresh collection, as necessary.
<b>Objective 20.10.</b> Increase the size of Mt. Hamilton thistle occurrences within the Reserve System to at least 2,000 individuals to ensure each occurrence has a viable number of individuals each year. Conduct targeted studies to determine feasibility of expanding occurrences. <sup>4,6,7</sup>	STUDIES-5. Conduct targeted studies to determine factors limiting the expansion of the covered plant species, including but not limited to its management and micro-site needs, and implement measures to mitigate or eliminate these factors to promote occurrence expansion.	Monitor the results and application of research on Mt. Hamilton thistle.
	STUDIES-16. Monitor the effects of livestock grazing (or predation by other species, e.g., black-tailed jackrabbit) on targeted covered plant species by conducting exclusion experiments and monitoring effects on occurrences, including control sites in the monitoring plan.	Monitor the effects of grazing on management on covered plant species.

Table 5-1d. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 20.11.</b> Protect at least 12 occurrences of smooth lessingia as part of the Reserve System within the study area, including a buffer zone of 150-meter (500 foot) buffer around each occurrence to reduce external influences and promote expansion of occurrences. <sup>4,5</sup>	LAND-P7. Acquire sites in the Reserve System that support eight occurrences of smooth lessingia.	Compliance monitoring and annual reports.
	STUDIES-12. Ensure seeds from natural occurrences in the Study Area are stored and maintained at a minimum of one Center for Plant Conservation certified botanic garden.	Monitor viability of seed collection and refresh collection, as necessary.
<b>Objective 20.12.</b> Locate or create at least 12 new occurrences of smooth lessingia and increase the size of all occurrence to ensure each occurrence has at least 2,000 individuals within the Reserve System. <sup>4,6,7</sup>	STUDIES-5. Conduct targeted studies to determine factors limiting the expansion of the covered plant species, including but not limited to its management and micro-site needs, and implement measures to mitigate or eliminate these factors to promote occurrence expansion.	Monitor the results and application of research on smooth lessingia.
	STUDIES-14. Determine suitable propagation or planting techniques for targeted covered plant species and determine biologically appropriate seed sampling techniques from existing occurrences.	
	STUDIES-16. Monitor the effects of livestock grazing (or predation by other species, e.g., black-tailed jackrabbit) on targeted covered plant species by conducting exclusion experiments and monitoring effects on occurrences, including control sites in the monitoring plan.	Monitor the effects of grazing on management on covered plant species.
<b>Objective 20.13.</b> Protect at least four occurrences of fragrant fritillary as part of the Reserve System within the study area, including a buffer zone of 500 feet around each occurrence to reduce external influences and promote expansion of occurrences. <sup>5</sup>	LAND-P8. Acquire sites along Coyote Ridge that support the four remaining unprotected fragrant fritillary occurrences.	Compliance monitoring and annual reports.
	STUDIES-12. Ensure seeds from natural occurrences in the Study Area are stored and maintained at a minimum of one Center for Plant Conservation certified botanic garden.	Monitor viability of seed collection and refresh collection, as necessary.
<b>Objective 20.14.</b> Increase the size of fragrant fritillary occurrences within the Reserve System to ensure each occurrence has a viable number of individuals each year. <sup>7</sup>	STUDIES-5. Conduct targeted studies to determine factors limiting the expansion of the covered plant species, including but not limited to its management and micro-site needs, and implement measures to mitigate or eliminate these factors to promote occurrence expansion.	Monitor the results and application of research on fragrant fritillary.

Table 5-1d. Continued

Biological Goals and Objectives	Conservation Actions	Monitoring Action
	STUDIES-16. Monitor the effects of livestock grazing (or predation by other species, e.g., black-tailed jackrabbit) on targeted covered plant species by conducting exclusion experiments and monitoring effects on occurrences, including control sites in the monitoring plan.	Monitor the effects of grazing on management on covered plant species.
<b>Objective 20.15.</b> Protect the one known occurrence of Tiburon Indian Paintbrush within the permit area that is not currently permanently protected as part of the Reserve System, including a buffer zone of 500 feet around each occurrence to reduce external influences. <sup>4</sup>	LAND-P9. Acquire the Tiburon Indian paintbrush occurrence located at the Kirby Canyon landfill mitigation site prior to or at the time the temporary conservation easement expires.	
	STUDIES-12. Ensure seeds from natural occurrences in the Study Area are stored and maintained at a minimum of one Center for Plant Conservation certified botanic garden.	Monitor viability of seed collection and refresh collection, as necessary.
<b>Objective 20.16.</b> Increase the size of the protected Tiburon Indian paintbrush occurrence within the Reserve System to ensure occurrence has at least 2,000 individuals. <sup>4,6,7</sup>	STUDIES-5. Conduct targeted studies to determine factors limiting the expansion of the covered plant species, including but not limited to its management and micro-site needs, and implement measures to mitigate or eliminate these factors to promote occurrence expansion.	Monitor the results and application of research on Tiburon Indian paintbrush.
	STUDIES-16. Monitor the effects of livestock grazing (or predation by other species, e.g., black-tailed jackrabbit) on targeted covered plant species by conducting exclusion experiments and monitoring effects on occurrences, including control sites in the monitoring plan.	Monitor the effects of grazing on management on covered plant species.
<b>Goal 21.</b> Protect and increase the size and number of Loma Prieta hoita within the study area.		
<b>Objective 21.1</b> (not used)		
<b>Objective 21.2</b> (not used)		
<b>Objective 21.3</b> (not used)		
<b>Objective 21.4</b> (not used)		
<b>Objective 21.5</b> (not used)		
<b>Objective 21.6</b> (not used)		
<b>Objective 21.7.</b> Protect four currently unprotected occurrences of Loma Prieta hoita in the study area as part of the Reserve System including a buffer zone of 500 feet around each occurrence to reduce external influences. <sup>4,5</sup>	LAND-P11. Acquire four sites in the study area that supports Loma Prieta hoita.	Compliance monitoring and annual reports.
	STUDIES-12. Ensure seeds from natural occurrences in the Study Area are stored and maintained at a minimum of one Center for Plant Conservation certified botanic garden.	Monitor viability of seed collection and refresh collection, as necessary.

Biological Goals and Objectives	Conservation Actions	Monitoring Action
<b>Objective 21.8.</b> Increase the size of protected Loma Prieta hoita occurrences within the Reserve System. <sup>6,7</sup>	STUDIES-5. Conduct targeted studies to determine factors limiting the expansion of the covered plant species, including but not limited to its management and micro-site needs, and implement measures to mitigate or eliminate these factors to promote occurrence expansion.	Monitor the results and application of research on Loma Prieta hoita.

## Notes:

<sup>1</sup> For the purposes of this Plan, a plant occurrence is defined as a group of individuals that are separated by at least 0.25 mile from other groups of individuals of the same species or subspecies, consistent with how plants are tracked by the CNDDDB. In some cases, an occurrence may be equivalent to a population; in other cases, multiple occurrences may form a single population. A biological population is defined differently for each of the covered plants and is often unknown due to a lack of population data. Therefore, an occurrence provides a single standard by which to measure impacts and conservation for all covered plants. During implementation, the Implementing Entity may conduct monitoring or management actions based on populations, which is a more biologically meaningful unit.

<sup>2</sup> Objectives that require protection of plant occurrence require that those occurrences be in currently unprotected land.

<sup>3</sup> For Mount Hamilton thistle population on the east side of Coyote Valley are defined as all occurrences in a discrete drainage; while population on the west side of Coyote Valley are defined as each occurrence point.

<sup>4</sup> Source for buffer width and minimum population size: USFWS Recovery Plan for Serpentine Soil Species of the San Francisco Bay Area (1998c)

<sup>5</sup> Land acquisition must occur in rough step with impacts as required by the Stay Ahead provision (see Chapter 8, Section 8.6.1). All land acquisition must be complete by Year 45. Land acquisition requiring restoration or creation of habitat for Covered Species must be complete by Year 40. Reference Table 5-29 for interim land acquisition timelines.

<sup>6</sup> Habitat enhancement, monitoring, and adaptive management program, will continue in perpetuity. Restoration and creation must occur in rough step with impacts as required by the Stay-Ahead provision (see Chapter 8, Section 8.6.1). All habitat restoration will be completed by year 40.

<sup>7</sup> The target number of individuals per occurrence will be adjusted or established as necessary pending research carried out during Plan implementation to assure viable occurrences of each covered plant species.

**Table 5-2a. Land Acquisition Actions**

Acquisition Action	Target Species
<b>Landscape (L)</b>	
LAND-L1. Acquire in fee title or obtain easements on 100 stream miles within the study area.	All covered species
LAND-L2a. Acquire in fee title or obtain easements on at least 33,205 acres of land for the Reserve System.	All covered species
LAND-L2b. Incorporate 13,291 acres of existing open space into the Reserve System.	All covered species
LAND-L2c. Acquire in fee title or obtain easements on 33,205 acres of land for the Reserve System that includes the full range of topographic and geographic diversity in the study area.	All covered species
LAND-L2d. Incorporate 13,291 acres of existing open space into the Reserve System that includes the full range of topographic and geographic diversity in the study area.	All covered species
LAND-L3. Acquire in fee title or obtain easements on streams (100 miles), ponds (50 acres), freshwater wetlands (10 acres), and seasonal wetlands (5 acres) in all watersheds of the study area.	California red-legged frog, California tiger salamander, western pond turtle, least Bell's vireo,
LAND-L4. Acquire and enhance natural and semi-natural landscapes between the Santa Teresa Hills and Metcalf Canyon to the south that will contribute to providing connectivity between the Santa Cruz Mountains and the Diablo Range to promote the movement of covered and other native species at many spatial scales (Linkage 10 in Table 5-9 and Figure 5-6).	Bay checkerspot butterfly, covered serpentine plants
LAND-L5. Acquire in fee title or obtain easements on 2,900 acres of serpentine grassland along Coyote Ridge to link existing protected areas and to create a large core reserve for serpentine grassland species to move within (Linkage 6 in Table 5-9 and Figure 5-6). These acreages are inclusive of, not in addition to, acquisition targets set in LAND-G3.	Bay checkerspot butterfly, covered serpentine plants, western burrowing owl
LAND-L6. Acquire in fee title or obtain easements on at least 3,000 acres of grassland, chaparral & coastal scrub, and oak woodland natural communities south of Henry W. Coe State Park to link this core reserve with extensive wetlands surrounding San Felipe Lake in San Benito County (Linkage 14 in Table 5-9 and Figure 5-6).	San Joaquin kit fox, California tiger salamander, California red-legged frog

Table 5-2a. Continued

Acquisition Action	Target Species
LAND-L7. Acquire in fee title or obtain easements on at least 2,300 acres of grassland, chaparral & coastal scrub, and oak woodland natural communities in the NE corner of the study area to link the core reserve that includes Joseph Grant County Park with SFPUC lands and other protected lands in Alameda County (Linkage 4 in Table 5-9 and Figure 5-6).	California tiger salamander, California red-legged frog
LAND-L8. Acquire in fee title or obtain easements on at least 500 acres of grassland, chaparral & coastal scrub, and oak woodland natural communities to connect Almaden Quicksilver County Park with protected open space to the east near Calero Lake (Linkage 9 in Table 5-9 and Figure 5-6).	California tiger salamander, California red-legged frog, western pond turtle
LAND-L9. Acquire in fee title or obtain easements on 2,000 acres of conifer woodland, riparian forest & scrub, oak woodland, and grassland natural communities, in the portion of the Pescadero Watershed that is in the study area and along the Pajaro River, to maintain wildlife connections between the Santa Cruz Mountains and the Gabilan Range outside the study area (Linkages 18, 19, and 20 in Table 5-9 and Figure 5-6).	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-L10. Acquire in fee title or obtain easements on serpentine grassland along Coyote Ridge to protect the connection between Silver Creek and Kirby Canyon (Linkage 6 in Table 5-9 and Figure 5-6) as part of the acquisition targets set in LAND-G3.	Bay checkerspot butterfly, covered serpentine plants
<b>Grassland (G)</b>	
LAND-G1. Acquire 4,130 acres of serpentine grassland by fee title or conservation easement with the full range of serpentine grassland associations and vegetation diversity found throughout the study area. This includes 4,000 acres of serpentine bunchgrass grassland, 120 of serpentine rock outcrops/barrens, and 10 acres of serpentine seeps.	Covered serpentine plants, Bay checkerspot butterfly
LAND-G2. Acquire 13,300 acres of annual grassland by fee title or conservation easement as part of the Reserve System. Target areas on both sides of Santa Clara Valley with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored. Acquisition of native grassland will be given priority.	California tiger salamander, western burrowing owl

Table 5-2a. Continued

Acquisition Action	Target Species
LAND-G3. Acquire in fee title or obtain conservation easements on 4,000 acres of suitable serpentine grassland habitat along ridges for Bay checkerspot butterfly on Silver Creek Hills, Coyote Ridge, Pigeon Point, Tulare Hill, Santa Theresa Hills, areas west of Calero Reservoir, and the Kalanas, and Hale/Falcon Crest in fee title or conservation easement. Habitat acquisition on Coyote Ridge and Tulare Hill is top priority. For other sites totaling 554 acres, prioritize sites, threat, patch size, current occupancy and prevalence of cool microsites for Bay checkerspot butterflies.	Covered serpentine plants, Bay checkerspot butterfly
LAND-G4. (not used)	
LAND-G5. (not used)	
LAND-G6. Acquire, obtain easements, or retain management agreements on burrowing owl nesting habitat within 2 miles the San Jose Water Pollution Control Plant Bufferlands, north of Highway 237.	western burrowing owl, San Joaquin kit fox, California tiger salamander
LAND-G7. Acquire, obtain easements, or retain management agreements on burrowing owl nesting habitat within 2 miles of the San Jose International Airport or other important northern San Jose breeding sites.	western burrowing owl
LAND-G8. Acquire or obtain easements on 21,310 acres of suitable overwintering habitat in the Diablo Range that support ground squirrel populations or could support them with improved management. This acreage is in addition to of the targets identified in LAND-G6 and LAND-G7.	western burrowing owl, San Joaquin kit fox, California tiger salamander
LAND-G9. Acquire in fee title or obtain easements on 4,100 acres of annual grassland and suitable oak woodland types (e.g., oak savanna and oak woodland within 500 feet of annual grassland) north and south of Highway 152 in modeled San Joaquin kit fox habitat.	western burrowing owl, San Joaquin kit fox, California tiger salamander
<b>Chaparral and Northern Coastal Scrub ( C )</b>	
LAND-C1. Acquire 400 acres of northern mixed chaparral/chamise chaparral by fee title or conservation easement.	California tiger salamander
LAND-C2. Acquire 700 acres of mixed serpentine chaparral by fee title or conservation easement.	California tiger salamander
LAND-C3. Acquire 1,400 acres of northern coastal scrub/Diablan sage scrub by fee title or conservation easement.	California tiger salamander

Table 5-2a. Continued

Acquisition Action	Target Species
<b>Oak and Conifer Woodland (OC)</b>	
LAND-OC1. Acquire in fee title or obtain conservation easements on 7,100 acres of mixed oak woodland and forest, including land in both the Santa Cruz Mountains and the Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	western burrowing owl, San Joaquin kit fox, California tiger salamander, California red-legged frog
LAND-OC2. Acquire 2,900 acres of coast live oak woodland and forest by fee title or conservation easement, including land in both the Santa Cruz Mountains and the Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	western burrowing owl, San Joaquin kit fox, California tiger salamander, California red-legged frog
LAND-OC3. Acquire 1,100 acres of blue oak woodland and 1,700 acres of valley oak woodland by fee title or conservation easement including land in both the Santa Cruz Mountains and the Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	western burrowing owl, San Joaquin kit fox, California tiger salamander, California red-legged frog
LAND-OC4. Acquire 80 acres of foothill pine-oak woodland and forest by fee title or conservation easement, including land in both the Santa Cruz Mountains and Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	western burrowing owl, San Joaquin kit fox, California tiger salamander, California red-legged frog
LAND-OC5. Acquire 20 acres of mixed evergreen forest by fee title or conservation easement including land in both the Santa Cruz Mountains and Diablo Range. Target areas with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored.	California tiger salamander, California red-legged frog, foothill yellow-legged frog
LAND-OC6. Acquire 10 acres of redwood forest by fee title or conservation easement.	California tiger salamander, California red-legged frog, foothill yellow-legged frog

Table 5-2a. Continued

Acquisition Action	Target Species
<b>Riverine and Riparian Forest and Scrub ( R )</b>	
LAND-R1. Extend the Uvas Creek Park Preserve 1.6 miles upstream to Hecker Pass Highway and setback expected development adjacent to this stream segment by a minimum of 100 feet to protect the Uvas Creek Corridor consistent with Goals 5-5, 5-7, and 5-8 of the approved City of Gilroy Hecker Pass Specific Plan. Target acquisitions will contribute to the protection of a total of 800 acres of riparian woodland and forest in the Uvas, Llagas, and Pacheco watersheds.	California red-legged frog, California tiger salamander, western pond turtle, foothill yellow-legged frog, least Bell's vireo
LAND-R2. Acquire in fee title or obtain conservation easements on lands that protect at least 250 acres and up to 578 acres of existing willow riparian forest and scrub or mixed riparian forest and woodland, including areas that provide key connectivity between existing riparian habitats in upper Coyote Creek, San Felipe Creek, Uvas Creek, Tar Creek, Little Arthur Creek, and Pacheco Creek.	California red-legged frog, California tiger salamander, western pond turtle, foothill yellow-legged frog, least Bell's vireo
LAND-R3. Acquire in fee title or obtain conservation easements on lands that protect at least 40 acres of existing Central California sycamore alluvial woodland to ensure that this very rare and threatened land cover type is preserved in the study area.	California red-legged frog, California tiger salamander, western pond turtle, foothill yellow-legged frog, least Bell's vireo
LANS-R4. (not used)	
LAND-R5. Acquire or obtain easements along 104 miles of perennial streams located above Uvas, Calero, Chesbro, Anderson, or in Uvas Creek below Uvas Reservoir, Upper Penitencia Creek, Alamitos Creek or Guadalupe Creek that have or could be restored to have cobblestone substrate and consistent, gentle flows from late March to late May.	California red-legged frog, California tiger salamander, western pond turtle, foothill yellow-legged frog, least Bell's vireo
<b>Wetland and Pond (WP)</b>	
LAND-WP1a. Acquire in fee title or conservation easement 10 acres of perennial freshwater wetlands suitable for covered or native species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-WP1b. Acquire in fee title or conservation easement up to 50 acres of perennial freshwater wetlands suitable for covered or native species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird

Table 5-2a. Continued

Acquisition Action	Target Species
LAND-WP2a. Acquire in fee title or conservation easement 5 acres of seasonal freshwater wetlands suitable for covered or native species and/or other seasonal wetlands capable of being enhanced or restored to support covered species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-WP2b. Acquire in fee title or conservation easement up to 30 acres of seasonal freshwater wetlands suitable for covered or native species and/or other seasonal wetlands capable of being enhanced or restored to support covered species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-WP3a. Acquire in fee title or conservation easement 50 acres of ponds suitable for covered or native species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-WP3b. Acquire in fee title or conservation easement up to 104 acres of ponds suitable for covered or native species in the Santa Cruz Mountains, Santa Clara Valley, and the Diablo Range.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-G2. Acquire 13,300 acres of annual grassland by fee title or conservation easement as part of the Reserve System. Target areas on both sides of Santa Clara Valley with a high concentration of ponds occupied by covered species or native species and/or other ponds capable of being restored. Acquisition of native grassland will be given priority.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-WP4. Acquire habitat that is adjacent to permanently protected aquatic resources with a high potential to support CRLF and is in the East San Francisco Bay Recovery Unit for red-legged frog (USFWS 2002) (Coyote Creek, Pacheco, and Pescadero Watersheds).	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-WP5. Acquire habitat that contains a matrix of aquatic and upland habitats and is also adjacent to Joseph D. Grant County Park, Palassou Ridge Open Space Preserve, southeast of Henry Coe State Park, Santa Cruz Mountain foothills, and Calero County Park in areas where dense forest is absent to reduce competition with other native amphibians (e.g., California newts).	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird

Table 5-2a. Continued

Acquisition Action	Target Species
LAND-WP6a. Acquire stream segments or ponds that currently provide or could provide high quality basking, breeding, and nesting habitat (vegetated banks and at least 150 feet of adjacent upland habitat) for western pond turtle.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-WP6b. Acquire stream segments or ponds that currently provide or could provide high quality basking, breeding, and nesting habitat (vegetated banks and at least 0.5 miles of adjacent upland habitat) for California tiger salamander.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-WP7. Acquire habitat near Santa Teresa Hills and Tulare Hill to provide connectivity between populations in the Diablo Range and the Santa Cruz foothills.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-WP8. Acquire in fee title or through a conservation easement at least 4 tricolored blackbird breeding sites that support, historically supported, or could support tricolored blackbird colonies each with at least 2-acres of breeding habitat and foraging habitat within 2 miles. Target at least 5 acres of suitable breeding habitat for tricolored blackbird within dry land farming or ranching complexes in the Santa Clara Valley and the Diablo Range	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
LAND-WP9. Acquire 200 acres of foraging habitat for tricolored blackbird in areas where there are protected breeding sites within 2 miles.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird
<b>Specific Plant Occurrences (P)</b>	
LAND-P1. Acquire in fee title or conservation easement sites in the study area that support three unprotected occurrences of Coyote ceanothus and provide the necessary buffer between incompatible land uses.	Coyote ceanothus
LAND-P2. Acquire in fee title or conservation easement sites in the study area that support 55 occurrences of Santa Clara Valley dudleya across a range of elevational gradients on both sides of Coyote Valley to ensure geographic diversity in protected occurrences.	Santa Clara Valley dudleya
LAND-P3. Acquire in fee title or conservation easement sites in the study area that support three occurrences of Metcalf Canyon jewelflower.	Metcalf canyon jewelflower
LAND-P4. Acquire north side of Tulare Hill to promote reintroduction of Metcalf Canyon jewelflower on west side of Valley.	Metcalf canyon jewelflower

**Table 5-2a. Continued**

Acquisition Action	Target Species
LAND-P5. Acquire sites in the study area that support 17 occurrences of most beautiful jewelflower.	Most beautiful jewel flower
LAND-P6. Acquire sites in the study area that support Mount Hamilton thistle in drainages or spring systems and stratify protection on both sides of Coyote Valley to ensure geographic diversity in protected occurrences.	Mount Hamilton thistle
LAND-P7. Acquire sites in the Reserve System that support eight occurrences of smooth lessingia.	Smooth lessingia
LAND-P8. Acquire sites along Coyote Ridge that support the four remaining unprotected fragrant fritillary occurrences.	Fragrant fritillary
LAND-P9. Acquire the Tiburon Indian paintbrush occurrence located at the Kirby Canyon landfill mitigation site prior to or at the time the temporary conservation easement expires.	Tiburon Indian paintbrush
LANS-P10. (not used)	
LAND-P11. Acquire four sites in the study area that supports Loma Prieta hoita.	Loma Prieta hoita

**Table 5-2b. Land Management Actions**

Management Action	Target Species	Monitoring Action
<b>Landscape Management (LM)</b>		
LM-1. Remove fences and private roads in areas where they are no longer needed and where their removal could increase the permeability of the study area for wildlife.	San Joaquin kit fox, American badger, Tule elk	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
LM-2. When replacing small culverts ensure that the culvert has a natural bottom and is large enough for larger mammals such as deer and mountain lions to pass, if feasible. Culverts must provide direct movement from one side of the road to the other and ensure that the culvert is visible to the target species (i.e., do not obscure entrance with vegetation). Install fencing or other features that will direct wildlife towards the culvert or other safe crossing within the first 20 years of implementation.	San Joaquin kit fox, western pond turtle, foothill yellow-legged frog	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
LM-3. Where structurally possible, replace culverts with free span bridges to ensure free movement for wildlife under roadways.	San Joaquin kit fox, western pond turtle, foothill yellow-legged frog	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
LM-4. Ensure that median barrier removal and/or median perforations are considered as alternatives during project design.	San Joaquin kit fox, American badger, bobcat	Compliance monitoring for infrastructure/structure removal, replacement, or installation.
LM-5. Remove median barriers or perforate sections of median barriers along roadways to improve successful wildlife crossings and install fencing or other features to direct wildlife to those open sections within first 20 years of implementation. Use feasibility study to determine location and length of barrier removal.	San Joaquin kit fox, mule deer, Tule elk	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
LM-6. Enhance or restore an estimated 17,440 acres of grassland, 2,500 acres of chaparral and northern coastal scrub, 12,900 acres of oak woodland, 290 acres of riparian forest and scrub, and 10 acres of conifer woodland within the Reserve System.	California tiger salamander, western burrowing owl, San Joaquin kit fox, covered plant species	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.

Table 5-2b. Continued

Management Action	Target Species	Monitoring Action
LM-7a. Restore a minimum of 1.0 miles of stream, 50 acres of riparian forest and scrub, and 20 acres of freshwater marsh, and create 20 acres of ponds to contribute to species recovery.	Least Bell's vireo, foothill yellow-legged frog, California red-legged frog, western pond turtle	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
LM-7b. If all predicted impacts occur, restore 10.4 miles of streams, 339 acres of riparian forest and scrub, 45 acres of freshwater marsh, and 30 acres of seasonal wetlands, and create 72 acres of ponds within all watersheds of the study area to maintain and when necessary improve stream hydrologic functions.	Least Bell's vireo, tricolored blackbird, foothill yellow-legged frog, California red-legged frog, western pond turtle	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
LM-8. Negotiate with Cal Fire and other local fire-fighting agencies the use of management response measures for all fire events and fire-dependent ecosystems that minimize impacts to natural communities and covered species while protecting human life and property. All burns will be responded to, and prescribed burns will be conducted, with minimum impact suppression tactics. Burn response will take into consideration ignition location and method, seasonality, weather and availability of suppression forces.	Covered plants, California tiger salamander, western burrowing owl	Compliance monitoring for infrastructure/structure removal, replacement, or installation. Monitor wildlife movement (or plant distribution if applicable) in target areas. Monitor movement of indicator species for connectivity.
LM-9. In identified "no burn" areas implement the biologically appropriate management actions that mimic the natural effects of fire (e.g., mowing, grazing, hand pulling) to subsequently improve habitat for native vegetation.	Covered plants, California tiger salamander, western burrowing owl	Analyze and quantify effectiveness of burning vs. other management actions in increasing diversity and quantity of native vegetation. Monitor target covered species response, if applicable.
LM-10. Integrate adopted policies for natural flood protection (i.e., Ordinance O6-1, Clean, Safe Creeks and Natural Flood Protection Plan, Coyote Watershed Stream Stewardship Plan) into flood protection projects to protect habitat for covered fish, amphibians, and reptiles.	Least Bell's vireo, foothill yellow-legged frog, California red-legged frog, western pond turtle	Compliance monitoring
LM-11. Graze, mow, hand-pull, to reduce non-native invasive plant species, both terrestrial and aquatic, to a level where native plants can reestablish and remain dominant within the Reserve System.	Covered plant species, California tiger salamander, western burrowing owl	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.

Table 5-2b. Continued

Management Action	Target Species	Monitoring Action
LM-12. Eradicate or reduce nonnative pig disturbance within the Reserve System through trapping, hunting, or other control methods. Success criteria is achieved through ensuring disturbances by nonnative pigs do not impair the ability of the Reserve System from meeting the biological goals and objectives.	Covered plant California tiger salamander, California red-legged frog, western pond turtle, oak woodlands	Analyze and quantify numbers of pigs eradicated and evidence of remaining population (e.g., pig observations or signs of damage).
LM-13. Eradicate or reduce nonnative predators (bullfrogs, invasive fish, feral cats) within the Reserve System through habitat manipulation (e.g., periodic draining of ponds), trapping, hand capturing, electroshocking or other control methods to achieve targets identified in reserve unit management plans.	California tiger salamander, California red-legged frog, western pond turtle, foothill yellow-legged frog	Monitor response of nonnative predators to habitat manipulation. Evaluate effect of predator abatement on native pond and wetland biodiversity. Determine presence of covered species.
LM-14. Selectively apply herbicides or other treatments to invasive plants.	Covered plants	Monitor status of non-native invasive plants in target eradication areas and assess efficacy of various techniques. Monitor covered species response.
<b>Grassland Management (GRASS)</b>		
GRASS-1. Continue or introduce livestock and native herbivore (e.g., elk) grazing in a variety of grazing regimes.	California tiger salamander, western burrowing owl, San Joaquin kit fox, covered plant species	Monitor effects of various grazing regimes on reducing nonnative plants and increasing diversity and biomass of native plants. In oak woodlands, monitor effects of various grazing regimes on oak woodland regeneration and recruitment. Monitor target covered species responses.
GRASS-2. Conduct prescribed burns. Use targeted studies to inform methods, timing, location, and frequency.	California tiger salamander, western burrowing owl, San Joaquin kit fox, covered plant species	Monitor effects of burning on reducing nonnative plants and increasing diversity and biomass of native plants. Monitor target covered species responses.
GRASS-3. Conduct mowing in selected areas to mimic grazing where use of livestock is impractical.	California tiger salamander, western burrowing owl, San Joaquin kit fox, covered plant species	Monitor effects of mowing on reducing nonnative plants and increasing diversity and biomass of native plants. Monitor target covered species response.
GRASS-4. Conduct selected seeding of native forbs and grasses in the Reserve System.	California tiger salamander, western burrowing owl, San Joaquin kit fox, covered plant species	Monitor success of seeding efforts in promoting native forbs and grasses. Monitor target covered species responses.

Table 5-2b. Continued

Management Action	Target Species	Monitoring Action
GRASS-5. Prohibit use of rodenticides within the Reserve System, except when needed to protect the integrity of structures, such as levees, stock ponds and dams.	California tiger salamander, western burrowing owl, San Joaquin kit fox	Monitor population trend of California ground squirrels. Track changes in burrowing mammal colony size over time.
GRASS-6. Introduce livestock grazing where it is not currently used, and where conflicts with covered activities are minimized, to reduce vegetative cover and biomass that currently excludes ground squirrel and encourage ground squirrel colonization of new areas within the Reserve System.	western burrowing owl, San Joaquin kit fox, California tiger salamander, California red-legged frog	Monitor population trend of California ground squirrels. Analyze and quantify changes in burrowing mammal colony size over time.
GRASS-7. Implementing Entity will initiate translocation efforts if natural colonization fails after five seasons in which core populations are at above-average population sizes. Through coordination with species experts and regulatory agencies translocate Bay checkerspot butterflies (eggs, larvae, or adults) from core populations into suitable but unoccupied sites if natural dispersal fails to reestablish population.	Bay checkerspot butterfly	Monitor at periodic intervals the success of translocation efforts in establishing new populations of Bay checkerspot butterfly.
GRASS-8. Implement vegetation management (i.e., graze/mow) that reduces vegetation height and density to optimal conditions for burrowing owls.	California tiger salamander, covered grassland plants, western burrowing owl	Monitor status of burrowing owl population and correlate species response to vegetation management.
GRASS-9. Create and maintain artificial burrows to encourage colonization of sites where ground squirrels establishment is not feasible or during the interim before ground squirrel colonies naturally establish.	Western burrowing owl	Monitor artificial burrow for occupancy twice annually, during the breeding season.
GRASS-10. Conduct at least one public education campaign in the southeastern portion of the study area within the first 10 years of implementation to provide landowners with information about management and land use techniques that are more compatible with movement and use by San Joaquin kit fox. Conduct additional meetings as needed.	San Joaquin kit fox	Ensure that at least one educational meeting is conducted within the first two years of implementation and then as needed after that.
<b>Chaparral and Northern Coastal Scrub Management (CHAP)</b>		
CHAP-1. Conduct prescribed burns in chaparral and northern coastal scrub to maintain canopy gaps and promote regeneration. Use targeted studies to inform locations and frequency.	California tiger salamander, California red-legged frog, western pond turtle, western burrowing owl, Coyote ceanothus	Monitor effects of burning on promoting canopy gaps, regeneration, and succession in chaparral and northern coastal scrub.

Table 5-2b. Continued

Management Action	Target Species	Monitoring Action
CHAP-2. Mechanically thin chaparral and northern coastal scrub to promote structural diversity. Use targeted studies to inform location and frequency.	California tiger salamander, California red-legged frog, western pond turtle, western burrowing owl, Coyote ceanothus	Monitor effects of mechanical thinning on promoting canopy gaps, regeneration, and succession in chaparral and northern coastal scrub.
CHAP-3. Identify areas in the Santa Cruz Mountains and eastern mountains where adjacent natural communities (e.g. grassland, oak woodland, conifer forests) are encroaching on chaparral and scrub land cover and, if appropriate, work to reduce the spread through manual reduction.		Analyze and quantify spread of adjacent natural communities into chaparral and scrub land cover types. Study spread rate after manual reduction.
<b>Oak and Conifer Woodland Management (OAK)</b>		
OAK-1. Conduct prescribed burns in low-density oak woodlands to enhance the community and to reduce non-native, invasive grass cover beneath oaks and encourage growth of a native understory and oak seedlings.	California tiger salamander, California red-legged frog, western pond turtle	Monitor effects of burning on promoting regeneration and recruitment of oak woodlands and understory land cover. Monitor covered species response.
OAK-2. Conduct prescribed burns in redwood forest to maintain or enhance native species diversity in the mid-canopy and understory.	California tiger salamander, California red-legged frog, western pond turtle, San Joaquin kit fox	Monitor effects of burning on promoting native species diversity.
OAK-3. Mechanically thin the understory of redwood forest in target areas to promote a healthy understory/canopy.	California tiger salamander, California red-legged frog	Monitor effects of mechanical thinning on regeneration and succession in the understory and canopy of conifer woodlands. Monitor target covered species response, if applicable.
<b>Riverine and Riparian Forest and Scrub Management (STREAM)</b>		
STREAM-1. Exclude livestock access to target stream segments (e.g., Pacheco Creek, floodplain of Coyote Creek) using exclusion fencing, off-channel water sources, and other potential actions.	California red-legged frog, foothill yellow-legged frog, western pond turtle, least Bell's vireo	Conduct pre- and post-treatment monitoring to document vegetation and covered-species response to exclusion.
STREAM-2. Plant and/or seed in native understory and overstory riparian vegetation within 15 feet of the edge of the low-flow channel to create structural diversity, provide overhead cover, and moderate water temperature at all riparian restoration sites.	California red-legged frog, foothill yellow-legged frog, western pond turtle, least Bell's vireo	Monitor the efficacy of seeding efforts with respect to structural diversity, overhead cover, and water temperature compared to designated reference locations. Indicator species will be selected and success criteria developed for large-scale restoration projects from the reference locations.

Table 5-2b. Continued

Management Action	Target Species	Monitoring Action
STREAM-3. Plant and/or seed in native riparian vegetation in gaps in existing riparian corridors, or re-establish severely degraded or historic riparian corridors, to promote continuity within conservation lands.	California red-legged frog, foothill yellow-legged frog, western pond turtle, least Bell's vireo	STREAM-4. Plant and/or seed in native riparian vegetation in gaps in existing riparian corridors to promote continuity.
STREAM-4. Replace concrete, earthen or other engineered channels as part of the 10.4 miles of stream restoration to restore floodplain connectivity. Location and length will be determined by site-specific conditions.	California red-legged frog, foothill yellow-legged frog, western pond turtle, least Bell's vireo	Compliance monitoring and annual reporting. Assess habitat quality of acquired land and prioritize areas for management.
STREAM-5. Replace confined channels to restore floodplain connectivity and commensurate functions as part of the 10.4 miles of stream restoration. Location and length will be determined by site-specific conditions.	California red-legged frog, foothill yellow-legged frog, western pond turtle	Conduct pre- and post-treatment monitoring of community function (performance of ecological processes); habitat composition, structure and pattern; and connectivity as part of a targeted study.
STREAM-6. Manage watershed-wide fine sediment inputs by conditioning controls on runoff from all development projects (see Condition 3) to improve riverine habitat functions and geomorphic processes.	California red-legged frog, foothill yellow-legged frog, western pond turtle, least Bell's vireo	Conduct annual spot checks on new developments to determine whether sediment run-off provisions are consistent with the Conditions outlined in this Plan.
STREAM-7. Implement a brown-headed cowbird control program in coordination with species experts and regulatory agencies that will reduce the impact of brood parasitism on least Bell's vireo nest success, if least Bell's vireos become regular nesters in the study area (>3 nests over at least two consecutive years) and brown-headed cowbird eggs are discovered in vireo nests.	Least Bell's vireo	Compliance monitoring. Monitor for riparian song bird nesting within least Bell's vireo modeled habitat. Periodically, every 5 years, monitor for least Bell's vireo outside of modeled habitat to document range expansion. Quantify the number of occurrences of brood parasitism that are occurring and if/when brown-headed cowbird control program is initiated and efficacy of program.
STREAM-8. Increase the amount of cobblestone substrate suitable to support breeding foothill yellow-legged frogs to 2,000 ft. to areas close to known occurrence(s) of foothill yellow-legged frog or immediately upstream or downstream of known occurrences or other high quality foothill yellow-legged frog breeding habitat.	Foothill yellow-legged frog	Assess yellow-legged frog response to increase in cobblestone substrate as part of a targeted study.

Table 5-2b. Continued

Management Action	Target Species	Monitoring Action
<b>Wetland and Pond Management (POND)</b>		
POND-1. Install fencing that will reduce grazing pressure and exclude feral pigs on portions of ponds and wetlands and provide vegetated refuge sites for covered species. Fence installation will be carefully applied to avoid negative impacts on small mammal movement and upland habitat.	California tiger salamander, California red-legged frog, western pond turtle	Monitor effectiveness of fencing to exclude livestock and feral pigs and compare vegetation inside of fencing to vegetation outside of fencing. Evaluate success of wetland and pond enhancement using established success criteria.
POND-2. Install woody debris around perimeter and in submerged banks of ponds and wetlands to create basking habitat and cover for native juvenile amphibians and turtles. Materials imported from outside of the watershed shall be treated for chytrid and other potential pathogens prior to installation.	California tiger salamander, California red-legged frog, western pond turtle	Analyze and quantify effectiveness of created basking site through routine monitoring in ponds with known western pond turtle occupancy.
POND-3. Plant native emergent vegetation around the perimeter and in ponds and wetlands.	California tiger salamander, California red-legged frog, western pond turtle	Monitor survivorship of planting, quantify vegetated perimeter of pond, describe habitat quality and periodically survey for species response from covered amphibians and reptiles. Evaluate success of wetland and pond enhancement using established success criteria.
POND-4. Clear vegetation and/or remove sediment in a way that minimizes negative effects on covered species when vegetation and/or sediment restricts the ability of the aquatic environment from meeting the biological goals and objectives of the Plan.	California tiger salamander, California red-legged frog, western pond turtle	Evaluate success of wetland and pond enhancement using established success criteria.
POND-5. If biologically appropriate, graze or mechanically thin around pond perimeter to mimic grazing and promote native species.	California tiger salamander, California red-legged frog, western pond turtle	Evaluate success of wetland and pond enhancement using established success criteria.
POND-6. Restore 20 acres of perennial freshwater marsh within the Reserve System in suitable sites and those likely to support covered species.	California tiger salamander, California red-legged frog, western pond turtle	Compliance monitoring. Monitor freshwater marsh and wetland restoration and assess whether success criteria are being met. Assess connectivity of restored complexes.
POND-7. In addition to the perennial freshwater marsh restoration described in POND-6, restore up to 25 acres of perennial freshwater marsh within the Reserve System in the Santa Cruz Mountains, Santa Clara Valley, and Diablo Range.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird	Compliance monitoring. Monitor freshwater marsh and wetland restoration and assess whether success criteria are being met. Assess connectivity of restored complexes.

Table 5-2b. Continued

Management Action	Target Species	Monitoring Action
POND-8. Restore up to 30 acres of seasonal wetlands within the Reserve System in the Santa Cruz Mountains, Santa Clara Valley, and Diablo Range.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird	Compliance monitoring. Monitor habitat restoration and assess whether success criteria are being met. Monitor use of restored habitat by tricolored blackbird.
POND-9. Create at least 20 acres of ponds at 40 sites, at least 10 sites in the Santa Cruz Mountains and 20 sites in the Diablo Range.	California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird	Compliance monitoring. Monitor pond construction and assess whether success criteria are being met.
POND-10. In addition to the creation of ponds described in POND-9, create up to 52 acres of ponds in-kind within the Reserve System to increase the amount available habitat and enhance connectivity among existing ponds and wetlands if all anticipated impacts occur. <sup>3</sup>	California tiger salamander, California red-legged frog, western pond turtle	Compliance monitoring. Monitor pond construction and assess whether success criteria are being met.
POND-11. Offer financial and regulatory (Safe Harbor Agreement) incentives to private landowners to enhance pond and wetland habitat to suit breeding California red-legged frog, California tiger salamander, and western pond turtle.	California tiger salamander, California red-legged frog, western pond turtle	Compliance monitoring.
POND-12. Educate the public that the use of any salamander species as bait is illegal in the State of California.	California tiger salamander	Compliance monitoring.
POND-13. Excavate sections of ponds to provide deeper pools that will be utilized by California red-legged frog adults and sub-adults and western pond turtles, while maintaining shallow areas to provide rearing habitat for California red-legged frog tadpoles, California tiger salamander larvae, and western pond turtle hatchlings.	California tiger salamander, California red-legged frog, western pond turtle	Monitor use of excavated pond by red-legged frog and western pond turtles as part of a targeted study.
POND-14. Offer financial or regulatory incentives (Safe Harbor Agreement, if listed) to private landowners to enhance pond and marsh habitat to suit breeding tricolored blackbirds, and to ensure that dry-land farming and ranching activities support breeding tricolored blackbirds.	Tricolored blackbird	Compliance Monitoring.
POND-15 Offer financial incentives to private landowners to ensure that dry-land farming and ranching activities support foraging tricolored blackbirds.	Tricolored blackbird	Compliance Monitoring.
POND-16. Restore freshwater marsh, seasonal wetlands, and/or ponds that will support dense reed-like vegetation (cattails) or other native vegetation that will attract nesting tricolored blackbirds.	Tricolored blackbird	Compliance monitoring. Monitor habitat restoration and assess whether success criteria are being met. Monitor use of restored habitat by tricolored blackbird.

Table 5-2b. Continued

Management Action	Target Species	Monitoring Action
POND-17. In areas with non-native vegetation (e.g., Himalayan blackberry) that supports existing tricolored blackbird colonies, initiate a gradual (3-4 year) transition from non-native vegetation to native vegetation that is structurally similar.	Tricolored blackbird	Determine areas where tricolored blackbirds are using non-native vegetation and ensure that there is a management plan in place to control the spread of the non-native vegetation and transition the colony to native vegetation if necessary.
POND-18. (not used)		
POND-19. Restore a minimum of 20 acres and up to 45 acres of freshwater marsh within the Reserve System in the Santa Cruz Mountains, Santa Clara Valley, and Diablo Range.	Tricolored blackbird	Compliance monitoring. Monitor habitat restoration and assess whether success criteria are being met. Monitor use of restored habitat by tricolored blackbird.
<b>Directed Studies</b>		
STUDIES-1. Conduct feasibility study to determine wildlife movement across Coyote Creek downstream of Anderson Reservoir, Pacheco Creek (SR 152), and the Pajaro River.	Covered wildlife species	Analyze and quantify movement of indicator species to determine whether linkages are functioning as intended.
STUDIES-2. Determine factors relevant to the health and regeneration of native chaparral/scrub species. Targeted studies will be initiated within first 10 years of plan implementation. Use results of targeted studies to revise and improve management actions.	California tiger salamander, California red-legged frog, western pond turtle, western burrowing owl	Conduct targeted research that identifies key factors affecting regeneration and succession of chaparral/scrub.
STUDIES-3. Experimentally manage oak woodlands to reduce seedling mortality, increase seedling and sapling survival and determine factors relevant to regeneration, including browsing by mammals, birds, and insects.	California tiger salamander, California red-legged frog, western pond turtle, San Joaquin kit fox	Conduct targeted research that identifies key factors affecting seedling mortality, seedling and sapling survival and factors relevant to oak woodland regeneration.
STUDIES-4. Experimentally manage redwood forest to determine factors relevant to regeneration and maintenance; possibly including prescribed burning, selective thinning, and other management actions to meet this objective.	California red-legged frog, foothill yellow-legged frog, western pond turtle	Conduct targeted research in redwood forest, ponderosa pine woodland, and knobcone pine woodland to guide management actions and other factors relevant to regeneration and maintenance.
STUDIES-5. Conduct targeted studies to determine factors limiting the expansion of the covered plant species, including but not limited to its management and micro-site needs, and implement measures to mitigate or eliminate these factors to promote occurrence expansion.	Coyote ceanothus, Santa Clara Valley dudleya, Metcalf Canyon jewelflower, most beautiful jewelflower, Mount Hamilton thistle, smooth lessingia, fragrant fritillary, Tiburon Indian paintbrush, Loma Prieta hoita	Monitor results of research and the effects of its application.

Table 5-2b. Continued

Management Action	Target Species	Monitoring Action
STUDIES-6. Conduct a directed study to census egg masses in breeding habitat downstream of reservoirs before and after releases to determine whether eggs masses were lost.	Foothill yellow-legged frog	Monitor effects of pulse flows on foothill yellow-legged frog.
STUDIES-7. In the case of ponds, wetlands, and/ or amphibian populations becoming infected with chytrid fungus or other diseases, use the best scientific information available to manage and stop spread of epidemic.	California tiger salamander, California red-legged frog, western pond turtle, foothill yellow-legged frog	Monitor for the presence of disease. Monitor efficacy of disease control actions.
STUDIES-8. Identify the distribution and risk to existing indigenous populations of covered amphibians and reptiles from hybridization (e.g., California tiger salamander hybridizing with Texas salamander) within the Reserve System. Appendix K, California Tiger Salamander Hybridization, will serve as the Management Plan for CTS hybridization issues and will be updated throughout the permit term for adaptive management	California tiger salamander	Monitor for the presence of non-natives and hybrids. Test and document efficacy of management plan.
STUDIES-9. Annually identify and maintain upland breeding sites (even if sites are not “natural”) for western pond turtle because of the high fidelity of use from year to year .	Western pond turtle	Monitor use of protected sites to determine factors influencing nest success in areas of known turtle use.
STUDIES-10. (not used)		
STUDIES-11. Conduct experimental burning in protected occurrences of targeted covered plant species to determine the importance of fire for plant regeneration.	California tiger salamander, western burrowing owl, San Joaquin kit fox, Coyote ceanothus	Monitor effects of burns on covered species
STUDIES-12. Ensure seeds from natural occurrences in the Study Area are stored and maintained at a minimum of one Center for Plant Conservation certified botanic garden.	Coyote ceanothus, Santa Clara Valley dudleya, Metcalf Canyon jewelflower, most beautiful jewelflower, Mount Hamilton thistle, smooth lessingia,	Monitor viability of seed collection and refresh collection, as necessary.

Table 5-2b. Continued

Management Action	Target Species	Monitoring Action
STUDIES-13. Identify suitable locations for and establish target number of new covered plant occurrences in the Reserve System.	Coyote ceanothus, Metcalf Canyon jewelflower	Compliance monitoring and annual reports.
STUDIES-14. Determine suitable propagation or planting techniques for targeted covered plant species and determine biologically appropriate seed sampling techniques from existing occurrences.	Coyote ceanothus, Metcalf Canyon jewelflower	Monitor newly established and source occurrences.
STUDIES-13. Identify suitable locations for and establish target number of new covered plant occurrences in the Reserve System.	Coyote ceanothus, Metcalf Canyon jewelflower	Monitor the results of all experiments.
STUDIES-14. Determine suitable propagation or planting techniques for targeted covered plant species and determine biologically appropriate seed sampling techniques from existing occurrences.	Coyote ceanothus, Metcalf Canyon jewelflower	Monitor newly established and source occurrences.
STUDIES-15. Design and implement field experiments (if the number of propagules will not be significantly impacted) to test alternative techniques for establishment of targeted covered plant occurrences. Field experiments will be continue until target number of occurrences are established.	Coyote ceanothus, Metcalf Canyon jewelflower	Monitor the results of all experiments.
STUDIES-16. Monitor the effects of livestock grazing (or predation by other species, e.g., black-tailed jackrabbit) on targeted covered plant species by conducting exclusion experiments and monitoring effects on occurrences, including control sites in the monitoring plan.	Santa Clara Valley dudleya, Mount Hamilton Thistle, smooth lessingia, Tiburon Indian paintbrush, fragrant fritillary	Monitor the effects of grazing on management on covered plant species.
STUDIES-17. Monitor Metcalf Canyon jewelflower and most beautiful jewelflower introgression and develop protocols to protect the genetic integrity of both species.	Metcalf Canyon jewelflower, most beautiful jewelflower,	Monitor the results of research and success of developed protocols.

**Table 5-3.** Guidelines Used to Set Quantitative Objectives for Species Habitat Protection in the Absence of Species-Specific Data

Proportion of Species' Current Range in the Study Area	General Range of Conservation Obligation of Plan <sup>1,2</sup>	Example Covered Species
96–100%	80–100%	Bay checkerspot butterfly, Coyote ceanothus, Santa Clara Valley dudleya, smooth lessingia, Metcalf Canyon jewelflower, most beautiful jewelflower
66–95%	65–90%	Mount Hamilton thistle
36–65%	40–75%	Loma Prieta hoita
11–35%	20–50%	California tiger salamander
1–10%	10–35%	California red-legged frog, foothill yellow-legged frog, least Bell's vireo
<1%	5–20%	San Joaquin kit fox, tricolored blackbird, Western burrowing owl, Western pond turtle

Notes:

1: Values expressed as a percentage of the available habitat in the study area and used as guidelines only in the absence of species-specific data. Actual conservation obligations were determined based on a variety of biological, economic, land use, and regulatory factors; see text for more explanation. Quantitative objectives were set using land cover types rather than species habitat.

2: Quantitative biological objectives were developed at the lower or higher end of these ranges based on a series of additional factors, or “modifiers.”

A conservation obligation was set at the higher end of the guideline (or beyond it) if one or more of the following factors applied:

- species' historic range was much greater than current range (i.e., a substantial range contraction has occurred);
- species is highly sensitive to management or human disturbance, or management needs are uncertain;
- species population sizes are relatively low or unknown;
- threats to species are severe or widespread;
- impacts from covered activities affect a relatively high proportion of species occurrences or potential habitat.

A conservation obligation was set near the low end of the scale if one or more of the following factors applied:

- species' habitat is abundant in the study area;
- there are a relatively large number of extant occurrences in the study area;
- the proportion of the species' range in the study is at the low end of the scale.

**Table 5-4.** Gap Analysis for Land Cover Types (acres)

Land Cover Type	Total in Study Area	Open Space Classification (acres, unless otherwise noted)						% of Total in StudyArea

Total Existing Open Space	29,930	13,291 <sup>3</sup>		

Table 5-5. Continued

Ownership	Area in Study Area (acres)	Proposed for Reserve System <sup>1</sup> (acres)	Existing Resources that Contribute Substantially to Biological Goals and Objectives of Habitat Plan	Conservation Actions Proposed
Interim Conservation Lands <sup>4</sup>				
<i>County Parks</i>				
Tulare Hill (October 2009)	141	134	• Habitat for Bay checkerspot butterfly, known locations of smooth lessingia and Santa Clara Valley dudleya, reintroduction site for Metcalf Canyon jewelflower, critical corridor connecting Diablo Range with Santa Cruz Mountains (Linkage 8).	• Conservation Analysis Zone Guadalupe-3
Rancho San Vicente (October 2009)	966	966	• Extensive serpentine grassland, serpentine chaparral, blue oak woodland, valley oak woodland, and riparian woodland; supports known populations of at least four covered species: Santa Clara Valley dudleya, most beautiful jewelflower, smooth lessingia, and Mt. Hamilton thistle; supports habitat for at least five covered species: Bay checkerspot butterfly, California red-legged frog (upland), California tiger salamander (upland), and Western burrowing owl (foraging); completes landscape linkage between Almaden Quicksilver County Park and complex of open space surrounding Calero Lake (Linkage 9).	• Conservation Analysis Zone Guadalupe-1
Total Interim Lands	1,107	1,100		

## Notes:

<sup>1</sup> Estimated amount to be added to the Reserve System based on air photo and land cover map analysis. Final acreage may differ (but will not exceed 13,291 acres). See Section 5.2.3, subheading *Existing Open Space in the Reserve System* and Section 9.4.2, subheading *Santa Clara County Open Space Authority* for a detailed discussion regarding incorporation of existing open space into the Reserve System.

<sup>2</sup> As described in Section 9.4.2 subheading *Santa Clara County Open Space Authority*, the Open Space Authority intends to enroll up to 1,000 acres of its existing lands into the Reserve System. These 1,000 acres may come from any of the Open Space Authority land identified.

<sup>3</sup> This is the maximum acreage of existing open space that would be credited toward the Reserve System size under the Plan. Additional acres of existing open space could be incorporated into the Reserve System; however, they would not receive credit toward the Reserve System size. Alternatively, the Implementing Entity may acquire new lands for the Reserve System in place of adding this acreage from existing open space, as long as the total Reserve System size requirements are met.

<sup>4</sup> Following the issuance of permits, lands acquired during Plan preparation may count toward permit obligations once the partner agency completes its recreation plans and the Wildlife Agencies approve of their incorporation into the Reserve System. Rancho San Vicente and Tulare Hill (acquired October 2009 using County Park Charter Fund) are considered interim conservation and could be incorporated into the Reserve System after recreation plans have been completed for those lands.

**Table 5-6.** Gap Analysis for Covered Species with Habitat Distribution Models (acres)

Species and Habitat Type	Total Modeled Habitat in Study Area	Open Space Classification (acres, unless otherwise noted)						% of Total Modeled Habitat in Study Area

Notes:

<sup>1</sup> See species account in Appendix D for key to habitat units and map of their locations. Habitat Unit names are derived from the long-term monitoring conducted by Stanford University.

<sup>2</sup> Occupied = known to be occupied at least in some years; Occupancy Unknown = site has not been surveyed thoroughly or surveyed in last 10 years;

Historic/Unoccupied = individuals present historically but now unoccupied and site likely no longer suitable; Potential (no records) = Site contains habitat that could be made suitable with proper management (currently unoccupied).

<sup>3</sup> Core habitat units are defined as moderate to large areas of suitable habitat that support persistent populations of the species. Satellite habitat units are defined as smaller areas of lower-quality habitat that are not consistently occupied and rely on recolonization from core habitat units to be sustained (U.S. Fish and Wildlife Service 1998).

<sup>4</sup> Habitat units targeted for conservation were determined through consultations with experts through the biological goals and objectives workshop and were based on factors such as population size, distance from Coyote Ridge, land ownership patterns, and overall long-term population viability.

<sup>5</sup> The majority of this habitat unit is not suitable habitat and is not targeted for conservation. However, portions of this site that support suitable habitat may be targeted for conservation to support connectivity to the Tulare Hill habitat unit.

<sup>6</sup> Population documented in late 1980s but no recent surveys.

<sup>7</sup> A small portion (less than 1 acre) of this habitat unit is expected to be added to the Reserve System from existing open space for Coyote ceanothus conservation. It is not considered a conservation target for Bay checkerspot butterfly.

**Table 5-8.** Gaps in Conservation Identified by San Francisco Bay Area Gap Analysis Project for Land Cover Types in the Habitat Plan Study Area<sup>1</sup>

Vegetation Community (Holland 1986)	Equivalent Land Cover Type in Habitat Plan (see Table 3-2)	Protection Estimated in Bay Area (Wild 2002)	Protection Estimated in California (Wild 2002)
Non-native grassland	Annual grassland	18%	5%
Northern mixed chaparral	Northern mixed chaparral / chamise chaparral	1%	8%
Mixed serpentine chaparral	Mixed serpentine chaparral	0%	1%
Diablan sage scrub	Northern coastal scrub/ Diablan sage scrub	12%	2%
Valley oak woodland	Valley oak woodland	18%	1%
Blue oak woodland	Blue oak woodland	19%	4%
Coast live oak woodland <sup>2</sup>	Coast live oak forest and woodland	20%	4%
Coast live oak forest <sup>2</sup>	Coast live oak forest and woodland	12%	5%
Foothill pine-oak woodland	Foothill pine-oak woodland	18%	3%
Great Valley cottonwood riparian forest	Mixed riparian forest and woodland	0% <sup>3</sup>	19%
North coast riparian scrub	Willow riparian woodland and scrub	0%	4%
Coast range ponderosa pine forest	Ponderosa pine forest	13%	23%
Coastal and valley freshwater marsh	Coastal and valley freshwater marsh	21%	38%

Notes:

<sup>1</sup> Vegetation communities are those in Wild (2002) with less than 20% protection for most types or less than 100% protection for those communities with a range-wide historic decline of more than 80%.

<sup>2</sup> These vegetation communities were also identified as having >25% of the state's extent within the San Francisco Bay Area (i.e., high endemism).

<sup>3</sup> Due to large minimum mapping unit, actual protection is likely higher.

**Table 5-9.** Landscape Linkages in and Near the Study Area Considered for the Reserve Design

Ref. # (Fig. 5-6)	Linkage (Listed Generally from North to South)	Approx. Length <sup>1</sup> (miles)	General Linkage Purpose	Covered and Other Native Species Likely to Use Linkage <sup>2</sup>	Sources
1	Guadalupe River and Guadalupe Creek	33	Connection between San Francisco Bay/Pacific Ocean and spawning habitat for native resident and anadromous fish. Provides regional linkage for riparian birds into the study area. Upper watershed provides local linkages for many wildlife species.	Steelhead trout, Chinook salmon, Pacific lamprey, and Sacramento sucker.	Leidy et al. 2005; FAHCE 2000
2	Coyote Creek from San Francisco Bay to Anderson Dam	32	Connection between San Francisco Bay/Pacific Ocean and spawning habitat for native resident and anadromous fish. Provides regional linkage for riparian birds into the study area. Also provides linkages for native amphibians and aquatic reptiles between off-stream breedings sites in Diablo Range and Santa Cruz Mountains.	Steelhead trout, Chinook salmon, Pacific lamprey, Sacramento sucker, California red-legged frog, Western pond turtle, foothill yellow-legged frog (?)	Leidy et al. 2005; FAHCE 2000; County of Santa Clara Parks & Recreation Department 2007; EDAW 2001; California Wilderness Coalition 2002
3	Upper Penitencia Creek	11.5	Connection between San Francisco Bay/Pacific Ocean and spawning habitat for native resident and anadromous fish.	Steelhead trout, Pacific lamprey, Sacramento sucker.	Leidy et al. 2005; Stillwater Sciences 2006; Biotic Resource Group 2001
4	Joseph D. Grant County Park to SFPUC Alameda Watershed (outside study area)	3	Provide linkage between protected lands in northeast corner of study area and protected lands in Alameda County (land owned by SFPUC and East Bay Regional Park District). Primary route may be along upper Calaveras Creek or Arroyo Hondo.	California red-legged frog, California tiger salamander, American badger, mountain lion, bobcat	L. Serpa pers. comm.; Jones & Stokes 2006; Thorne et al. 2002
5	Joseph Grant Co. Park to Henry W. Coe State Park	11.5	Provide connection between two large blocks of protected lands across a variety of land-cover types, possibly along San Felipe Creek.	California red-legged frog, California tiger salamander, American badger, Tule elk, mountain lion, bobcat, pronghorn,	State of California 1985; H. Coletto pers. comm.; Thorne et al. 2002
6	Coyote Ridge from Silver Creek Hills to Anderson Dam	9.5	Provide connectivity for serpentine species within core habitat along Coyote Ridge. Link patches of protected lands along the ridge.	Bay checkerspot butterfly, Mt. Hamilton thistle, Metcalf Canyon jewelflower, most beautiful jewelflower, smooth lessingia, Santa Clara Valley dudleya, fragrant fritillary, Tiburon paintbrush, Opler's longhorn moth, Hom's and Jung's microblind harvestman	USFWS 1998c; J. Hillman pers. comm.; Weiss and Wright 2005; T. Marker pers. comm.; Also see species accounts in Appendix D

Table 5-9. Continued

Ref. # (Fig. 5-6)	Linkage (Listed Generally from North to South)	Approx. Length <sup>1</sup> (miles)	General Linkage Purpose	Covered and Other Native Species Likely to Use Linkage <sup>2</sup>	Sources
7	Coyote Ridge to Anderson Lake County Park and Henry W. Coe State Park	7.5	Provide connectivity along an elevation gradient and between protected open space along Coyote Ridge and large blocks of protected open space centered on Henry W. Coe State Park. Provide connectivity among stands of valley oak woodland at different elevations.	Tule elk, American badger, bobcat, Mt. Hamilton thistle, Santa Clara Valley dudleya	H. Coletto pers. comm.; Diamond 2006; T. Diamond pers. comm.; Also see species accounts in Appendix D
8	Santa Teresa Hills to Metcalf Canyon	3	Most northerly and narrowest connection between Diablo Range and the Santa Cruz Mountains. Provides important linkages for variety of mammals and invertebrates.	Bay checkerspot butterfly, Mt. Hamilton thistle, American badger, bobcat	Spencer et al. 2006; Diamond 2006; T. Diamond, pers. comm.; Coastal Training Program 2006; The Nature Conservancy 2006a
9	Calero Co. Park to Almaden Quicksilver County Park	1.5	Provides short linkage between two large County parks (and Open Space Authority lands) and provides linkage outside the study area to extensive protected lands in the Santa Cruz Mountains owned by Midpeninsula Regional Open Space District and the Peninsula Open Space Trust. May be the only viable grassland connection between extensive grassland in the two County parks.	American badger (?), bobcat, mountain lion, Mt. Hamilton thistle, most beautiful jewelflower, smooth lessingia, Loma Prieta hoita, Santa Clara Valley dudleya	See plant species accounts in Appendix D
10	Calero County Park to Coyote Lake-Harvey Bear Ranch County Park, across Tulare Hill/Santa Teresa Hills	18	Provides linkage from Coyote Ridge and Diablo Range to Santa Cruz Mountains via Tulare Hill or Fisher Creek.	Bay checkerspot butterfly, American badger, bobcat, mule deer	City of San Jose 2007; Coastal Training Program 2006; California Wilderness Coalition 2002
11	Llagas Creek from headwaters to confluence with Pajaro River	32	Provides access in wet years from Pajaro River to current and historic spawning and rearing habitat for resident and anadromous fish. Provides regional linkage for riparian birds into the study area from the south and the west. Also may provide local linkages for native amphibians and aquatic reptiles.	Steelhead trout, Pacific lamprey, Monterey roach, Sacramento sucker, Sacramento pikeminnow, western pond turtle, foothill yellow-legged frog, least Bell's vireo, bobcat, California red-legged frog (?)	Smith 2007; Also see species accounts in Appendix D

Table 5-9. Continued

Ref. # (Fig. 5-6)	Linkage (Listed Generally from North to South)	Approx. Length <sup>1</sup> (miles)	General Linkage Purpose	Covered and Other Native Species Likely to Use Linkage <sup>2</sup>	Sources
12	Uvas Creek from headwaters to confluence with Pajaro River	25.5	Provides access from Pajaro River to spawning habitat for resident and anadromous fish. Provides regional linkage for riparian birds into the study area from the south and the west. Also provides local linkages for native amphibians and aquatic reptiles. Provides linkage to outside the study area in Santa Cruz County and to the large and diverse Forest of Nisene Marks State Park.	Steelhead trout, Pacific lamprey, Monterey roach, Sacramento sucker, Sacramento pikeminnow, western pond turtle, least Bell's vireo, bobcat, California red-legged frog, foothill yellow-legged frog	Smith 2007; Also see species accounts in Appendix D
13	Uvas Canyon County Park to Pajaro River through Santa Cruz Mountains	15.5	Provides long-distance connection along spine of Santa Cruz Mountains within the study area (similar linkages identified nearby outside the study area). Provides important connectivity for redwood forest and associated plants. Links Mount Madonna County Park with Uvas Canyon County Park.	Bobcat, mountain lion, California red-legged frog, California tiger salamander, coast redwood	The Nature Conservancy 2006a; Thorne et al. 2002
14	Henry W. Coe State Park to San Felipe Lake	5	Provides closest link between upland habitat and San Felipe Lake, an important large wetland complex in San Benito County. Also provides linkage with high density of ponds between high-elevation habitats in Henry W. Coe State Park and low elevation uplands at edge of study area (i.e., strong environmental gradient).	California tiger salamander, California red-legged frog, western pond turtle, American badger (?), tricolored blackbird (?)	See species accounts in Appendix D
15	Henry W. Coe State Park southeast to San Benito County line	9	Provides linkage across Pacheco Creek and Highway 152 within the Diablo Range. Highway 152 is permeable to wildlife only in certain places (see text for details).	San Joaquin kit fox, mountain lion, bobcat, Tule elk (?), California tiger salamander, California red-legged frog, western pond turtle	Thorne et al. 2002; Also see species accounts in Appendix D
16	Romero Ranch to Henry W. Coe State Park	3.5	Provides connectivity between two large blocks of protected open space.	Mountain lion, bobcat, California tiger salamander, California red-legged frog, western pond turtle	See species accounts in Appendix D

Table 5-9. Continued

Ref. # (Fig. 5-6)	Linkage (Listed Generally from North to South)	Approx. Length <sup>1</sup> (miles)	General Linkage Purpose	Covered and Other Native Species Likely to Use Linkage <sup>2</sup>	Sources
17	Main stem of Pacheco Creek	12	Provides passage for resident and anadromous fish between Monterey Bay, the Pajaro River, and potential spawning and rearing habitat on south fork of Pacheco Creek and Cedar Creek. Passage through main stem of Pacheco Creek is restricted in dry years.	Steelhead trout, Pacific lamprey, California red-legged frog, Sacramento sucker, western pond turtle, mountain lion, bobcat, least Bell's vireo	Smith 2007; Also see species accounts in Appendix D
18	Santa Cruz Mountains to Diablo Range along Pajaro River	9.5	Provides movement habitat for anadromous fish between Monterey Bay and spawning habitat in the Pacheco Creek watershed. Also provides important linkage for upland and riparian wildlife between Diablo Range and Santa Cruz Mountains.	Steelhead trout, Pacific lamprey, California red-legged frog, western pond turtle, mountain lion, bobcat, least Bell's vireo, tricolored blackbird (?)	The Nature Conservancy 2006a; also see species accounts in Appendix D
19	Santa Cruz Mountains to Gabilan Range	4	Provides linkage from the Santa Cruz Mountains to the Gabilan Range in San Benito County. The only connection south from the Santa Cruz Mountains to the Santa Lucia Ranges to the south.	Mountain lion, bobcat, California red-legged frog	Coastal Training Program 2006; The Nature Conservancy 2006a; Thorne et al. 2002
20	Santa Cruz Mountains to Lomerias Muertas Range	4.5	Provides linkage from the Santa Cruz Mountains to the Lomerias Muertas Range in San Benito County.	Mountain lion, bobcat	The Nature Conservancy 2006a; Thorne et al. 2002

Notes:

<sup>1</sup> Approximate length within the study area.<sup>2</sup> Other native species identified in this column include species that depend on linkages for long-distance movement or to maintain large home ranges and for which data are available indicating the species may use the particular linkage. Common native species such as raccoon, opossum, coyote, and skunk would likely use all of the linkages and are less sensitive to land use changes within the linkages than the other native species identified.

Notes:

<sup>1</sup> All terrestrial natural land cover types with permanent impacts have land acquisition requirements except for coyote brush scrub and knobcone pine woodland. Coyote brush scrub is not important for any covered species and it is an early-successional community. It will be acquired anyway in the course of meeting other requirements. Knobcone pine woodlands do not provide important habitat for the covered species; as such they are not targeted for acquisition. For ponderosa pine, no permanent impacts are anticipated to occur and nearly all of this terrestrial natural land cover type is protected as Type 1 open space. As such, it is not targeted for acquisition.

<sup>2</sup> Permanent impact only. Source = Table 4-2.

<sup>3</sup> These acreage requirements are the minimum necessary to compensate for impacts of covered activities and contribute to the recovery of covered species. Actual acquisitions of these land cover types is likely to be greater than these minimum requirements because the Plan also includes requirements for connectivity, protection of plant occurrences, and others that will result in additional acquisitions and because parcels purchased to meet a specific requirement will include additional acres of non-target land cover types.

<sup>4</sup> Minimum Open Space = Habitat Plan requirement + existing open space.

**Table 5-12.** Required Preservation, Enhancement, Restoration and Creation Mitigation Ratios and Estimated Acquisition, Enhancement, Restoration, and Creation Requirements for Aquatic Land Cover Types

Land Cover Type	Maximum Allowable Permanent Impacts <sup>1</sup> (acres)	Preservation and Enhancement Requirements		Restoration or Creation Requirements		
		Required Preservation Ratio	Preservation Requirement to Offset Impacts <sup>1</sup> (acres)	Required Mitigation Ratio (in addition to preservation)		Estimated Total Restoration or Creation (acres)
				Restoration	Creation	
<b>Riparian forest and scrub</b>						
Willow riparian forest and scrub or mixed riparian forest and woodland <sup>3</sup>	289	2:1	578 <sup>2</sup>	1:1	–	289
Central California sycamore alluvial woodland	7	2:1	14	2:1	–	14
<b>Wetland</b>						
Coastal and valley freshwater marsh (perennial wetland)	25	2:1	50	1:1	–	25
Seasonal wetland <sup>3</sup>	15	2:1	30 <sup>3</sup>	2:1	–	30
<b>Open Water</b>						
Pond <sup>4</sup>	52	2:1	104	–	1:1	52
Total Aquatic Land Cover Types (acres)	388		776			410
Stream (miles)	9.4	3:1	28.2	1:1	–	9.4

Notes:

<sup>1</sup> Impact limits are based on Table 4-2 for permanent impacts only. Actual acquisition requirements will be based on field-delineated resources at impact sites and application of the required preservation ratios in this table. Restoration, creation, and enhancement of aquatic land cover is required in addition to preservation of aquatic land cover as mitigation for impacts. See Chapter 5 for details.

<sup>2</sup> Because these land cover types are dynamic and represent different points on a continuum of vegetation succession, acquisition requirements for willow riparian woodland and scrub and mixed riparian woodland and forest are considered together and can be counted against either type of impact.

<sup>3</sup> Seasonal wetland acreage was quantified as the minimum polygon encompassing clusters of seasonal pools or drainages (i.e., wetland complexes). Impacts and land acquisition requirements will be tracked by the wetland delineation submitted in the Application Package described in Chapter 6, Section 6.8 and verified by the local jurisdiction, so estimates in this table overstate the expected impacts to and preservation of these land cover types. .

<sup>4</sup> Pond creation to mitigate for impacts will be accomplished by creating ponds of approximately the same size as those lost. Pond creation to contribute to recovery will be accomplished by creating ponds with an approximate average size of a 0.5 acre.

**Table 5-13.** Acquisition, Restoration, and Creation Requirements for all Land-Cover Types (acres)

Land Cover Type	Total in Study Area	Estimated and Allowable Permanent Impact <sup>1</sup>	Estimated Impact (% of Total)	Min. Protection Requirements for Contribution to Recovery <sup>2</sup>	Min. Notes:

<sup>1</sup> Source: Table 4-2.

<sup>2</sup> These acreage requirements are the minimum necessary to compensate for impacts of covered activities and contribute to the recovery of covered species, regardless of the actual level of impact. Sources: Tables 5-11 and 5-12. Actual acquisitions of these land cover types is likely to be greater than these minimum requirements because the Plan also includes requirements for connectivity, protection of plant occurrences, and others that will result in additional acquisitions and because parcels purchased to meet a specific requirement will include additional acres of non-target land cover types. Requirements for acquisition of Willow Riparian Forest and Scrub and Mixed Riparian Forest and Woodland are 250 acres of either type; for the purposes of this table the requirement is split in half (see Table 5-12).

<sup>3</sup> Habitat restoration and creation requirements apply only to riparian, wetlands, pond, and stream land cover types. See Table 5-12 for details.

<sup>4</sup> Compensatory protection applies only to riparian, pond, and wetland land cover types (see Table 5-12). Values are the maximum compensation estimated if all impacts of covered activities occur to these land cover types. The estimate for Willow Riparian Forest and Scrub and Mixed Riparian Forest and Woodland is a joint requirement and is split for this table. These values are inclusive of the acres in the proceeding Minimum Protection Requirements for Contribution to Recovery (see Section 5.3.1, subtitle *Acquisition and Restoration Requirements for Aquatic Land Cover Types* for rationale).

**Table 5-14.** Commitments by Time Period for Restoration and Creation Requirements that Contribute to Species Recovery

Land Cover Types	Restoration/ Creation Requirements to Contribute to Recovery <sup>1</sup>	Restoration/ Creation Commitments by Time Period (acres, except where noted)		
		Year 15	Year 30	Year 40 <sup>2</sup>
Willow Riparian Forest and Scrub and Mixed Riparian Forest and Woodland	50	18.8	37.5	50
Coastal and Valley Freshwater Marsh	20	7.5	15.0	20
Pond	20	7.5	15.0	20
<b>Total</b>	<b>90</b>	<b>33.8</b>	<b>67.5</b>	<b>90</b>
Streams (miles)	1.0	0.3	0.7	1.0

Notes:

<sup>1</sup> Source: Table 5-13. For wetland and riparian land cover types, timing targets in this table apply to contributions to recovery; preservation and restoration required due to impacts is tied to the Stay-Ahead provision.

<sup>2</sup> All land acquisition must be completed by Year 45. All habitat restoration must be completed by Year 40.

**Table 5-15.** Minimum Distance from Urban Development<sup>1</sup> Required for Aquatic Land Cover Types to Count Toward Land Acquisition or Restoration/Creation Requirements

Land Cover Type	Minimum Distance from Dense Urban Development Required for Credit	Rationale and Sources
Coastal and valley freshwater marsh	750 feet	Perennial wetlands may support a variety of covered species including tricolored blackbird, California red-legged frog, western pond turtle, and California tiger salamander. Tricolored blackbirds may be sensitive to disturbance and predation from urban pets and aquatic amphibians rely on adjacent upland habitats for nesting and non-breeding season refugia, so a relatively large buffer is required. Though amphibians have been documented traveling great distances from aquatic breeding sites (Reese 1996 [Western pond turtle]; Trenham and Shafer 2005 [California tiger salamander] there is a gradual reduction of upland occurrence as distance from the aquatic feature increases. Trenham and Shafer (2005) captured 50% of California tiger salamander adults within 150 m (492 ft) and 90% within 490 m (1608 ft) from aquatic breeding habitat. A 750-foot buffer between aquatic habitat and urbanization could reasonably support more than 50% of individuals breeding in the wetland/pond if suitable upland habitat was available.
Seasonal wetland	100 feet if wetland is up-gradient from development; 250 feet if wetland is down-gradient of development	Habitat function may decline if seasonal wetlands are located within 100 feet of dense urban development. Hydrologic effects of development can be more severe if seasonal wetland is located down-gradient. Seasonal wetlands, as defined by the Plan, are unlikely to support covered species because their hydroperiod is often shorter than the breeding time required by covered aquatic species. As a result, buffer requirements are based more on ecosystem function rather than species needs.
Pond	750 feet from pond edge	This is the approximate distance below which available upland habitat for pond-breeding covered species begins to diminish substantially (Reese 1996 [Western pond turtle]; Trenham 2001[California tiger salamander]; Semlitsch and Bodie 2003 [amphibians]).
Stream <sup>2</sup>	150 feet from top of bank	This setback is recommended by many authors to maintain stream physical properties (e.g., sediment and nutrient reduction, moderation of stream temperature, channel complexity), salmonid habitat, plant diversity, and other functions.
Riparian woodland/scrub (any land cover type)	50 feet from vegetation dripline	The minimum setback required in Condition 11 (Chapter 6) from the riparian dripline is 50 feet. The land acquisition credit limit accounts for the loss of riparian habitat function within this buffer and the estimated loss of some value for riparian birds and amphibians beyond it.

Notes:

<sup>1</sup> Urban development is defined as the planning limit of urban growth. Development within County jurisdiction outside the planning limit of urban growth triggers these restrictions if that development is as dense as that found within the planning limit of urban growth.

<sup>2</sup> Applies to land acquisition requirement only. Stream restoration can be accomplished within urban areas at any distance from dense urban development for stream restoration credit under the Habitat Plan.

	Extant in California	Study Area	Type 1 Open Space <sup>4</sup>	Additional Occurrences Found (relative to baseline)	Total in Study Area	Total Maximum Impacted <sup>5</sup>	Mitigation Ratio <sup>6</sup>	Protected per Mitigation Ratio	Protected to Contribute to Recovery <sup>7</sup>	Total Protected in Reserve System <sup>8</sup>	Acquired <sup>9</sup>	Allowable Creation in lieu of New Occurrence Acquisition <sup>10</sup>

Notes:

<sup>1</sup> See Chapter 3 for data sources.

<sup>2</sup> For the purposes of this Plan and the analyses, occurrences are equivalent to populations for all species except for Santa Clara Valley dudleya.

<sup>3</sup> More occurrences may be found during Plan implementation than were known during Plan preparation (baseline). These columns represent the minimum number of known occurrences that must be known in the study area before impacts described in the subsequent column can occur. The first line for each species accounts for occurrences known at the time of permit issuance. “Additional Occurrences Found” refers to the number of additional occurrence found during the permit term. “Total in Study Area” is the number of additional occurrence found during the permit term plus the number of occurrence known during Plan preparation.

<sup>4</sup> Occurrences that are only partially in open space are not included in totals.

<sup>5</sup> Occurrences are considered impacted if the occurrence is removed or a qualified biologist determines that occurrence viability will be reduced as a result of covered activities, as further described in Chapter 6, Condition 20. Impacts solely associated with implementation of the conservation strategy are not reflected in this column as those impacts will be minor and temporary in nature and will have a net benefit to the species. No new occurrence acquisition will allow additional impacts beyond what is listed in this table. Refer to Chapter 4 for full explanation of impacts by species.

<sup>6</sup> Mitigation ratios were only developed for species for which additional impacts could occur in the event that additional occurrences are found during the permit term. Ratios were calculated as the number of occurrences acquired if no additional occurrences were discovered during the permit term by the total maximum occurrences that could be impacted if no additional occurrences were discovered during the permit term. The mitigation ratio represents the number of occurrences that must be acquired prior to each impact, including the first impact. Species-specific requirements regarding timing of mitigation/conservation relative to impact are provided in Section 5.4 for the Tiburon Indian paintbrush, Coyote ceanothus, and Metcalf Canyon jewelflower.

<sup>7</sup> Recovery actions will occur regardless of impacts; however, acquisition activities performed for mitigation purposes can count toward recovery once the total mitigation obligation is achieved.

<sup>8</sup> With the exception of the Coyote ceanothus (see Section 5.4.11), all occurrences acquired or created in this Plan will be permanently protected within the Reserve System with a conservation easement and/or will be owned in fee by the Implementing Entity. The first row for each species in this column represents the minimum requirement of acquisition and creation regardless of the number of occurrences impacted (e.g., if no additional occurrences of Mt. Hamilton thistle are found during Plan implementation, the Implementing Entity will acquire 22 occurrences for the Reserve System even if less than six occurrences are impacted during the permit term).

<sup>9</sup> Acquisition of naturally-occurring occurrences could occur through fee title and/or conservation easement. Occurrences could be on land newly acquired under the Habitat Plan or on existing open space that is incorporated into the Reserve System. Occurrences must be acquired prior to impacts, with the exception of the Coyote ceanothus (see Section 5.4.11).

<sup>10</sup> For occurrence preservation, priority will always be given to acquisition, however, if acquisition is infeasible, creation is allowed as stipulated in Section 5.4. The decision to focus conservation effort on occurrence creation will be made jointly with the Wildlife Agencies. Creation will be completed by Year 40, acquisition will be completed by Year 45.

<sup>11</sup> Impacts are allowed to no more than 3,650 individuals or 5% of the population adjacent to Anderson Dam, whichever is smaller. This standard will be applied to the population as it existed during the 2009 surveys. It will not be applied to any new recruits that are a result of natural or artificial disturbance event such as fire.

**Table 5-17.** Commitments to Acquire and Enhance Modeled Habitat in the Reserve System for Covered Species with Models (acres)

Species and Habitat Type	Habitat in Study Area (acres) <sup>1</sup>	Modeled Habitat in Type 1 Open Space		Modeled Habitat in Type 1,2, and 3 Open Space		Commitment to Acquire Modeled Habitat for Reserve System (acres)	Maximum Modeled Habitat added to the Reserve System from Existing Open Space (acres) <sup>2</sup>	Total Protected in Reserve System and Type 1 Open Space		Total in Reserve System and Type 1, 2, and 3 Open Space

<sup>1</sup> All area measurements are in acres unless otherwise noted.

<sup>2</sup> County Park lands added to Reserve System and converted from Type 2 or 3 Open Space to Type 1 (see Table 5-5) within the Reserve System would be enhanced, where appropriate. A maximum of 13,291 acres of existing open space could be credited toward the Reserve System size under the Plan. Additional acres of existing open space could be incorporated into the Reserve System; however, they would not receive credit toward the Reserve System size. Alternatively, the Implementing Entity may acquire new lands for the Reserve System in place of adding this acreage from existing open space, as long as the total Reserve System size requirements are met.

<sup>3</sup> Western burrowing owl modeled occupied nesting and potential nesting modeled habitat is quantified inside the study area only. The Implementing Entity will manage a minimum of 5,300 acres of western burrowing owl nesting (occupied and potential) habitat throughout the permit area by the end of the permit term. Of this acreage, a minimum of 600 acres of occupied nesting habitat must be protected in fee title or conservation easement as part of the Reserve System. For the remaining 4,700 acres, land acquisition (fee title or easement) or management agreements may be used and the land may not be part of the Reserve System. However, lands not acquired will be under permanent management agreements by year 45. Additional detail is provided in Chapter 5 and Appendix M.

**Table 5-18.** Land Acquisition and Enhancement Requirements for Selected Conservation Analysis Zones (acres)

<sup>1</sup> Only those conservation analysis zones with serpentine grassland are shown.

**Table 5-20.** Management Consideration for Significant Invasive Plants in the Plan Area

Species	Management Considerations
Non-native Annual Grasses (multiple species)	<p>The grasslands of the region are overwhelmingly dominated by very aggressive weedy grasses and forbs that evolved under extreme grazing pressure in the Mediterranean region of Southern Europe, North Africa, and the Middle East before invading and replacing the native California grasslands. The annual-dominated grasslands that we have today are quite different in significant ways from the native grasslands of the past—different species, different animal herbivory and traffic, and different management by people. Without management (mostly with livestock grazing), these aggressive plants grow tall and dense (even in serpentine), choking out the habitat structure that allowed the currently endangered plants and animals to survive through the last 250 or more years. Grazing still controls the growth of these plants in their native grasslands around the Mediterranean Sea, and in California has facilitated the persistence of a host of endangered species in our grasslands.</p> <p><b>Grazing Management.</b> The existing science of grasslands and their management tells us that some kind of grazing is far better than none, for multiple conservation purposes, including maintenance of habitat for grassland-dependent special-status species. Grazing termination or exclusion has led to local extirpations of endangered species, particularly during years of above-normal precipitation (e.g., Bay checkerspot butterfly). Research and experience has shown that grazing can be prescribed more precisely to create and maintain the desired habitat structure for special-status species, fire fuel patterns, and reduction of pest plants, while minimizing impacts. Livestock’s role in grassland conservation and grazing management, as well as the fire, mechanical, and herbicide treatment options are described in text.</p>
Barbed goatgrass ( <i>Aegilops triuncialis</i> )	<p><b>Grazing Management (risks of spread/timing/intensity).</b> Small infestations can be spread quickly by attachment of the barbed seeds to livestock and wildlife, and by distribution of livestock replacement hay. Heavy grazing during the growing period, followed by late-spring rest has increased the density of this pest. Heavy grazing during the early growing season can be effective in limiting seed production.</p> <p><b>Fire.</b> Thorough late-spring burning of infested patches, where there is abundant herbaceous fuels and before seedheads have emerged, has been effective. Multiple burns are required because of persistence of a viable seedbank.</p> <p><b>Mechanical.</b> Mowing has been less effective than grazing because prostrate plants escape injury. Mowing during the early growing season can be effective in limiting seed production.</p> <p><b>Herbicides.</b> Glyphosate can be effective if the infestations are small and found early. This herbicide can be effective if used in the winter or spring, but repeated applications are likely to be necessary to deplete the seedbank.</p>
Black mustard ( <i>Brassica nigra</i> )	<p><b>Grazing Management (Timing/Intensity).</b> Disturbance, including excessive grazing, promotes the dominance and spread of black mustard. The fast growing, fibrous stems and branches of black mustard are generally not preferable to livestock. Black mustard favors nutrient-rich soils that are especially prevalent in areas used by cattle. Once dominance by black mustard is established, allelopathic chemicals leaching from dead stalks and tissues further prevents the establishment of other plants.</p> <p><b>Fire.</b> Dense black mustard stands may increase the fire frequency as plants are extremely flammable upon desiccation. There is no evidence in the available literature that prescribed burning is an effective technique to control black mustard infestations. The increased nitrification of soil and lack of viable competitors may increase the level of infestation.</p> <p><b>Mechanical.</b> Mowing and hand pulling is very effective for controlling relatively small populations of black mustard. Mowing should be timed for early spring, prior to the production of viable seeds.</p> <p><b>Herbicides.</b> 2-4-D and glyphosphate are both effective herbicides for control of black mustard. These are best applied to rosettes immediately after mowing.</p>

Species	Management Considerations
Italian thistle ( <i>Carduus pycnocephalus</i> )	<p><b>Grazing Management (Timing/Intensity).</b> Although cattle grazing has demonstrated limited success in controlling Italian thistle, properly timed grazing will minimize the spread of seed and slow the rate of infestation. Light to moderate intensity early to mid-spring grazing prior to the production of flowering heads is preferable and will minimize soil disturbance and nitrification of soil, which favors Italian thistle establishment and spread.</p> <p><b>Fire.</b> Very little data supports the use of fire as an effective mechanism for Italian thistle control. Many ecologists have observed dramatic increases in the size of Italian thistle infestations following fire. This is likely due to the increased nutrients released into the soils and lack of competition from other annual plants. However, similar to YST, burning over 2 or more consecutive years is likely to reduce the viable seedbank and decrease the size and density of Italian thistle colonies. This strategy is best used as part of an integrated pest management program.</p> <p><b>Mechanical.</b> For relatively small infestations of Italian thistle, mowing is the preferred method for control. This technique requires mowing before seed production over several consecutive years (or even within years). Slashing is even more effective because more of the above ground plant material is removed. Italian thistle has been shown to readily flower in plants that are cut at or above 8 cm above the ground. Further, if plants are cut too close to flowering, they can still produce viable seed after they have been mowed. Hand hoeing is the most effective technique for small patches, especially if roots are severed 10 cm below the ground surface because plants will not resprout in the same growing season.</p> <p><b>Herbicides.</b> Herbicides are most effective in combination with other weed management techniques. 2-4-D has shown some success and is best applied directly to the roots when thistles are less than 0.25m.</p>
Yellow star thistle ( <i>Centaurea solstitialis</i> )	<p><b>Grazing Management. (Timing/Intensity).</b> Cattle grazing must occur prior to blooming period of spiny flower heads. High intensity early spring grazing followed by mowing/herbicide application is an effective method for control although full eradication is highly improbable.</p> <p><u>Note:</u> Goats are preferable to cattle because they will browse on spiny flower heads later in the year. Yellow star thistle is highly toxic and may be fatal to horses.</p> <p><b>Fire.</b> Prescribed burning has proven effective only after repeated burns over 2 or more consecutive years. Otherwise, fire is counterproductive and will increase germination and spread of YST due to increased light penetration and soil warming resulting from the removal of thatch and other competing plant species. Prescribed burning in a single year may be effective as part of an integrated pest management strategy including mowing and herbicides.</p> <p><b>Mechanical.</b> Although labor intensive and time consuming, mowing is an effective strategy for controlling yellow star thistle after plants have bolted but prior to the production of viable seeds. This technique is most effective for small, isolated populations.</p> <p><b>Herbicides.</b> Clopyralid is the most effective herbicide for full season control of YST registered for use in California. Unlike most post-emergence herbicides, it provides both foliar and soil activity. The best timing for application is when YST is in the early rosette stage. Glyphosphate (Roundup) is useful for control after plants have bolted. Herbicides are best utilized as part of an integrated pest management program.</p>
Bull thistle ( <i>Cirsium vulgare</i> )	<p><b>Grazing Management (Timing/Intensity).</b> Cattle will not consume bull thistle due to long, stiff spines at the end of the leaves and subtending the flowers. However, bull thistle tends to colonize in disturbed overgrazed areas including wallows near water troughs.</p> <p><b>Fire.</b> Biennial forbs, including most thistles, require burning over 2 or more consecutive years for effective control. A single fire will likely increase the level of bull thistle infestation.</p> <p><b>Mechanical.</b> Repeated mowing will control infestations of bull thistle, but mowing must be timed before the production of flowers</p>

Species	Management Considerations
	<p>and viable seeds.</p> <p><b>Chemical.</b> 2-4-D, clopyralid, picloram, and dicamba are effective herbicides for controlling bull thistle. Herbicide application is most effective when applied to rosettes prior to the production of flowers and viable seeds.</p>
Common teasel ( <i>Dipsacus fullonum</i> )	<p><b>Grazing Management (Exclusion).</b> In general, spiny flower-heads are natural deterrent to cattle grazing. Dense infestations are generally impenetrable to livestock. There is evidence that cattle will not consume teasel prior to flower production due to the bitter taste and spiny leaves. However, because teasel is spread by seed, cattle may incidentally translocate seeds and spread teasel to other sites. Disturbance and denuded vegetation from heavy grazing is also likely to facilitate teasel establishment due to increased nutrients (nitrification) and lack of competition from other plants.</p> <p><b>Fire.</b> Late spring prescribed burns may be somewhat effective for teasel control. However, because fire will not carry well through dense stands of mature plants, fire alone will not eradicate teasel. Prescribed burning may make it easier to locate rosettes for mechanical or chemical control.</p> <p><b>Mechanical.</b> Mowing prior to the production of mature flowers is effective for control of teasel, but will not eradicate common teasel. Hand pulling or mattocking is preferable due to full removal of perennial root systems.</p> <p><b>Chemical.</b> 2-4-D applied in the spring to rosettes prior to mature flower production is effective for teasel eradication. This strategy is best used in combination with mowing as part of an integrated pest management program.</p>
Blue gum eucalyptus ( <i>Eucalyptus globulus</i> )	<p><b>Grazing Management. (None).</b> Eucalyptus displaces native plant communities/wildlife habitat due to rapid establishment and growth. Allelopathic properties in the leaves and stems prevent recruitment of all but the hardiest understory vegetation. Eucalyptus will rapidly invade grasslands, reducing the available forage for cattle. Furthermore, aromatic and woody seedlings/saplings are unlikely to be ingested by cattle.</p> <p><b>Fire.</b> No data exists to support the use of prescribed fire to control eucalyptus. However, there is some speculation that prescribed burning prior to cutting trees may assist with herbicide application. In general, eucalyptus infestations are expected to increase the wildfire frequency due to fast growing and highly flammable properties of this species.</p> <p><b>Mechanical.</b> Cutting trees and leaving stumps flat and low to the ground is the common method for control followed by stump grinding or direct herbicide application. Hand pulling of seedlings and saplings up to one inch in diameter is also an effective means of control.</p> <p><b>Chemical.</b> Various herbicides are typically applied to cut stumps. The most commonly used herbicide is 25–50% dilute glyphosphate applied directly to the stump within several minutes of cutting. Because eucalyptus will re-sprout from cut stumps, new growth should be monitored and controlled for up to three years. It has been postulated the best time to remove regrowth is when shoots are 6-8 feet high and are still a major net energy investment for the tree.</p>
Fennel ( <i>Foeniculum vulgare</i> )	<p><b>Grazing Management (None).</b> Grazing management will not control existing fennel infestations in SCTP. Mature fennel is not palatable to livestock and most infestations are located outside of selected grazing management units. However, fennel is not typically found in grazed pastures. Moderate intensity grazing should prevent the establishment of new fennel infestations.</p> <p><b>Fire.</b> Prescribed burning is not a feasible strategy for fennel control in STCP due to proximity to roads and private residences.</p> <p><b>Mechanical.</b> While mowing prior to seed production may prevent further spread of fennel, eradication requires cultivation of plants including full removal of the roots. Although labor intensive, mattocking or hand digging are the preferred strategies for eradication.</p> <p><b>Chemical.</b> Application of 2-4-D while plants are growing but prior to flower production has proven effective. Plants must be wetted</p>

Species	Management Considerations
Milk thistle ( <i>Silybum marianum</i> )	<p data-bbox="478 243 1858 300">prior to application, particularly the crowns. However, because fennel is often located on embankments adjacent to waterways or impermeable road surfaces, herbicide application may not be feasible.</p> <p data-bbox="478 316 1900 430"><b>Grazing Management (Intensity).</b> Accumulated nitrates in milk thistle leaves are toxic to cattle. Thorny spines on the leaf margins and flower heads will cause selective avoidance by cattle as well. Residual dry matter (litter) in the late summer and fall is a highly important inhibitive factor in the germination of milk thistle seed. Thus, the level of grazing in areas supporting this plant should be carefully managed for appropriate levels of RDM.</p> <p data-bbox="478 446 1900 560"><b>Fire.</b> No data exists to support the use of prescribed fire to control milk thistle infestations. Some observers have noticed a decrease in milk thistle following accidental burns, but this has not been corroborated experimentally. It is generally believed that nutrient loading from fire and lack of competitors will increase milk thistle germination. Prescribed burning may be useful if repeated over 2+ consecutive years.</p> <p data-bbox="478 576 1900 722"><b>Mechanical.</b> Mowing alone is not an effective method of control for milk thistle. Plants are often able to re-sprout and grow back in the same year, or produce viable flower heads below the level of the mower. Tilling or digging prior to flower productions is far more effective in that it removes the entire plant. Plants removed in this manner should be bagged and disposed of offsite because any flowers will still go to seed even after they have been uprooted. Tilled areas should be re-vegetated using a non-invasive, preferably native seed mix to avoid further establishment of milk thistle and other invasive species.</p> <p data-bbox="478 738 1900 820"><b>Herbicides.</b> Spot spray application of 2-4-D, dicamba or picloram during the seedling to rosette phases of milk thistle development has demonstrated effective control. A recent experiment using the herbicides picloram and methabenzthiazuron in combination with phenoxyacetic acid compound was 100% effective in eradicating milk thistle.</p>

## Chapter 6

# Conditions on Covered Activities and Application Process

## 6.1 Introduction

As required by ESA (Section 10[a][2][A][ii]) and Fish and Game Code Sections 2820 (a)(6) and 2820(f), this Plan includes measures to avoid and minimize take of covered species. These measures to avoid and minimize impacts are described as *conditions on covered activities* and are designed to achieve the objectives listed below.

- Provide avoidance of covered species during implementation of covered activities throughout the study area.
- Prevent take of individuals from covered activities as prohibited by law (e.g., take of fully protected species).
- Minimize adverse effects on natural communities and covered species where conservation actions will take place.
- Avoid and minimize impacts on jurisdictional wetlands and waters throughout the study area.

In the context of effects on covered species, one of the greatest benefits of an HCP/NCCP is that mitigation for individual projects can be implemented systematically on a regional scale. This enables a more comprehensive approach to conservation that concentrates protection where it has the greatest value. The Plan also restricts covered activities in high-value land cover types (e.g., wetlands, serpentine grassland) and for some species (e.g., covered plants and selected covered wildlife species). By protecting high-quality areas in the Reserve System and restricting covered activities in areas of higher biological value, regional avoidance and minimization goals are supported.

This chapter describes conditions on covered activities that help meet regional avoidance and minimization goals. Regional avoidance and minimization reduces the need for individual projects to avoid and minimize impacts at the project scale and allows streamlining of regulatory requirements. This Plan assumes that take will result from individual covered activities and that this take will be mitigated through the conservation strategy (Chapter 5). Most activities covered under this Plan are required to provide limited documentation of field conditions to verify these assumptions (see Section 6.2 *Exemptions from Conditions*).

Avoidance and minimization measures are regulated by federal, state, and local programs. The conditions on covered activities (avoidance and minimization measures), described in this chapter do not supersede requirements by other agencies and are not intended to provide a basis for non-compliance with other applicable design guidelines required by other federal, state, and local agencies.

This chapter also describes the application process for individual projects to request coverage under this Plan. The application process is described in detail at the end of this chapter in Sections 6.7 *Receiving Take Authorization under the Plan* and 6.8 *Habitat Plan Application Package*. The conditions on covered activities and application process are included in this chapter together so that project proponents have one location in this document in which all requirements are described.

The NCCP Act requires that the Permittees get concurrence from the Wildlife Agencies before adopting, amending, or approving any plan or project that is inconsistent with the objectives and requirements of this Plan<sup>1</sup>. The conditions described in this chapter are designed to ensure this consistency and provide standard and predictable requirements for project applicants. However, Permittees may need to adopt or impose additional conditions beyond those described in this chapter for unanticipated projects or effects in order to ensure consistency with the Habitat Plan and compliance with the NCCP Act. The Permittees will evaluate all projects respective to their authorities to ensure that all applicable conditions described in this chapter have been incorporated into the project prior to extending take coverage under the Plan. Chapter 8 describes applicant responsibilities in the application process.

In addition to the conditions described in this chapter to avoid and minimize impacts, covered activities may also require payment of mitigation fees (see Chapter 9), provision of land in lieu of mitigation fees (see Chapter 8), or habitat restoration or creation in lieu of wetland fees.

## 6.2 Exemptions from Conditions

Many projects within the study area do not disturb the ground or have little or no measurable impact on the covered species or natural communities. Because the probability of take is so low, the need to enforce conditions on the projects and activities specified below would not provide a net benefit for species. Therefore, these covered activities are not subject to the conditions described in this chapter. Quantifiable impacts associated with activities exempt from conditions of the Habitat Plan will be reported in the Application Package (see Section 6.8, below) (impacts that cannot be quantified will not be tracked). Although these covered activities are exempted from the conditions, all of them receive take coverage (**Table 6-1**).

---

<sup>1</sup> Fish and Game Code Section 2820(b)(3).

Exemptions based on land cover types are based on the mapping for this Plan at the time of permit issuance and the nature of covered activities previously permitted on the site.

Many of the covered activities exempt from the conditions in this chapter may also be exempt from the Habitat Plan fees, as described in Chapter 9, Section 9.4.1 *Habitat Plan Fees*. The association between covered activities exempt from conditions on covered activities and Habitat Plan fees are shown in **Table 6-1**.

The following activities and projects are exempt from all of the conditions in this chapter and are not tracked as impacts by the Implementing Entity (as described above)<sup>2</sup>.

- Projects that do not result in ground disturbance do not result in release of potential water quality contaminants, or do not create new wildlife barriers.
- Private-sector, routine-maintenance activities that require a development, grading, or building permit, and that occur inside the urban service area (private-sector activities that do not require a development, grading, or building permit are not covered by the Plan or its conditions or fees).
- Private-sector, routine-maintenance activities that require a development, grading, or building permit; that occur outside of the urban service area; and that occur within 50 feet of all existing structures at the time of Plan commencement or within 50 feet of structures that were permitted for incidental take under the Habitat Plan.
- Any covered activity described in Chapter 2 that occurs in urban-suburban, landfill, reservoir<sup>3</sup>, or agriculture developed<sup>4</sup> land cover types as verified in the field, unless the activity may affect a mapped or unmapped stream, riparian, serpentine, pond, or wetland land cover types, or the activity is located in a stream setback (see Condition 11 for a discussion of stream setbacks).
- Routine infrastructure maintenance by public agencies within the planning limit of urban growth that do not affect stream, riparian, serpentine, ponds, or wetland land cover types.
- Routine infrastructure maintenance by public agencies that occurs in urban-suburban, landfill, reservoir, or agriculture developed land cover types that do not affect stream, riparian, serpentine, pond, or wetland land cover types. Examples of such activities include filling pot-holes and resurfacing existing roads without expansion of the paved area.

<sup>2</sup> Project proponents are still required to comply with survey and avoidance requirements for applicable local, state, and federal laws not addressed by the Habitat Plan (e.g., local tree ordinances, state fully protected species, the federal Migratory Bird Treaty Act).

<sup>3</sup> “Reservoir” does not include the dam face. Exemptions described in this chapter do not apply to projects impacting the face of covered dams.

<sup>4</sup> The land cover type “agriculture developed” (also known as agriculture developed/covered ag) is defined in Chapter 3 as intensive agricultural operations such as nurseries and greenhouses.

The following activities<sup>5</sup> are also exempt from all conditions in this chapter but will be tracked by the Implementing Entity as impacts when they occur on natural land cover types.

- Additions to existing structures or new structures that are within 50 feet of an existing structure (e.g., a new garage) that result in less than 5,000 square feet of impervious surface so long as no stream, riparian, wetlands, ponds, or serpentine land cover type are affected. Additions are cumulative and must be calculated based on the footprint of the structure at time of Plan implementation to determine whether this threshold has been crossed.
- A covered activity on a parcel of less than 0.5 acre or less as long as no serpentine, stream, riparian, pond, or wetland land cover type is within the parcel.

A project proponent of a covered activity in the Plan will not be required to comply with the conditions in this chapter or pay any Habitat Plan fees if the proponent of the activity provides written confirmation to the Implementing Entity that the CDFG and USFWS have determined that the activity is not subject to CESA and ESA, respectively; or has already received the necessary take authorizations under CESA and ESA; or has otherwise complied with CESA and ESA. An activity will be deemed to be in compliance with CESA and ESA by the Implementing Entity and thus be exempt from the conditions in this chapter and otherwise comply with the Habitat Plan if the proponent provides the following:

1. Letters from both USFWS and CDFG that specifically refers to the activity and states that the activity is not likely to result in take of any federally or state listed species and will not preclude successful implementation of the conservation strategy for all covered species, or
2. A copy of an incidental take permit issued by CDFG for the activity, and copies of incidental take statements or incidental take permits issued by USFWS that authorize the incidental take associated with the proposed activity.

Additional covered activities are exempt from species surveys, as described in Section 6.8.5 *Item 5: Results of Applicable Species Surveys and Monitoring*, below.

Activities or projects listed in Chapter 2, Section 2.4 *Projects and Activities Not Covered by this Plan*, are specifically excluded from coverage under this Plan and therefore cannot receive take authorization, are not subject to the conditions in this chapter, and do not pay Habitat Plan fees (see Section 2.4 for additional information on these excluded activities and projects). These projects are listed below.

---

<sup>5</sup> Although private development that does not meet the criteria described in Section 2.3.2 *Urban Development* subheading *Private Development Coverage Area* and additions of less than 5,000 square feet of new impervious surface (regardless of parcel size) are not subject to the Plan, project proponents may choose to opt into the Plan. If project proponents seek to have these activities covered, the bulleted exemptions apply.

- Private sector activities that do not obtain a development, grading, building, or other construction permit involving land disturbance for the purposes of making land improvements, such as the construction of buildings, roads, and driveways ("building permits" referenced herein do not include plumbing, electrical, or mechanical permits). Activities that do not obtain these development permits are not covered by the Plan.
- SCVWD Stream Maintenance Program activities.
- City of Gilroy expansion beyond the Plan's planning limit of urban growth.
- Bay Area to Central Valley high-speed train.
- New highway between I-5 and U.S. 101.
- Routine and ongoing agricultural activities or expansion of cultivated agriculture into natural land cover types, including vineyard development, that does not seek discretionary approval or permitting by the local jurisdiction.
- Timber harvest operations.
- Quarries and other mining other than expansion of Freeman Quarry (except as otherwise noted).
- New and expanded landfills other than Kirby Canyon, Pacheco Pass Landfill expansions, and landfills occurring inside the planning limit of urban growth of the three cities.
- Mercury removal/remediation (unless described in Chapter 2 as a covered activity).
- Corps led projects.
- Pacheco dam reconstruction and reservoir enlargement.
- Pesticide/ herbicide application for the federal permit.
- Installation and operation of groundwater wells (except as otherwise noted).
- Increased development due to incorporation of San Martin.
- Dam removal and/or construction of new dams.
- Wind farm development.
- Water importation from outside the SCVWD service area.
- Emergency activities.

## 6.3 Conditions on All Covered Activities

The conditions below are categorized and described in several ways: by activity type, by natural community, and by species. Collectively they provide for regional and site-specific avoidance and minimization of impacts on covered species and sensitive land cover types. It is the responsibility of project

proponents to design and implement their projects in compliance with these conditions. For private projects, the applicable local jurisdictions will review project compliance with the conditions in this chapter. The Local Partners will determine best adherence to conditions where discretion exists. If a project applicant proposes to use a less preferable design option (e.g., a culvert instead of a free-span bridge), the project applicant must demonstrate why a preferred option is infeasible. For private applicants, local jurisdictions will determine if this rationale is sufficient under these circumstances.

Conditions on covered activities, including avoidance and minimization measures identified for certain covered activities and species-specific measures, may be revised over the course of the permit term based on results of implementation through the adaptive management process. Proposed revisions will be reviewed by the Wildlife Agencies upon submission of each annual report to ensure the successful implementation of the conservation strategy. Agencies will review and respond within 30 days. Revisions to conditions will be approved by the Wildlife Agencies prior to the Permittees adopting revised conditions. Allowing such revisions will ensure that out-of-date or unsuccessful management techniques do not persist and that best available science can be incorporated into the conditions as appropriate for the Plan.

Compliance with the Habitat Plan does not preclude compliance with all other applicable state and federal laws. It is the project proponent's responsibility to ensure compliance with all applicable laws and regulations.

All projects that discharge dredged or fill material into waters of the United States, including federal jurisdictional wetlands, are required to obtain applicable permits (e.g., Clean Water Act Section 404 and Section 401) from the Corps and the Regional Board. Projects that place fill, alter the bed bank or channel, or divert the flow of streams, alter portions of streams above the ordinary high water mark, alter streams that lack a nexus to navigable waters, wetlands, or lakes under the jurisdiction of the state only are required to obtain a waste discharge requirement from the Regional Board and enter into a streambed alteration agreement with CDFG<sup>6</sup>. Any project that requires a permit from the Corps, Regional Board, or CDFG for impacts on streams and other aquatic areas may be subject to avoidance and minimization requirements. Those requirements may differ from the avoidance and minimization requirements in this Plan.

Condition 1, described below, pertains to all covered activities. Other conditions specifically pertain to certain types of activities, certain species, or certain natural communities and are enumerated in subsequent sections.

---

<sup>6</sup> Activities covered by this Plan that need a streambed alteration agreement are expected to fully meet the standards of the streambed alteration agreement through compliance with this Plan for species covered by the Plan.

## Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species

### Contra Costa Goldfields

Contra Costa goldfields is a federally endangered and CNPS 1B plant species whose extreme rarity precludes coverage under the Habitat Plan. Because the Habitat Plan does not cover the species, compliance is required on an individual basis.

The likelihood of discovery of new occurrences is very low. If a new occurrence of this species is found, its avoidance would be of the highest importance to the species' viability. If an applicant encounters Contra Costa goldfields on their site, they will contact the USFWS for written concurrence of avoidance to ensure that the project does not jeopardize the continued existence of the species.

### Wildlife Species Protected Under Other Laws

Several wildlife species that occur in the study area are listed as fully protected, as defined under Sections 3511 and 4700 of the California Fish and Game Code. As described in Chapter 1, CDFG cannot issue permits for take<sup>7</sup> of these species. Fully protected species that are known or likely to occur in the study area are listed below.

- Golden eagle.
- Bald eagle.
- American peregrine falcon.
- Southern bald eagle.
- White-tailed kite.
- California condor.
- Ring-tailed cat (= ringtail).

Three of the fully protected raptor species—white-tailed kite, peregrine falcon, and golden eagle—forage widely throughout the study area but nest in discrete locations. Bald eagles are rare winter migrants to Santa Clara County but have been known to breed in the San Francisco Bay Area. A California condor population has been established in San Benito County (Pinnacles National Monument) and birds forage occasionally in Santa Clara County. Additionally, ringtails may be found in some riparian woodlands in the study area.

Further, all migratory bird species and their nests are protected under the Migratory Bird Treaty Act (MBTA). All birds listed above and those covered by

---

<sup>7</sup> Take is defined more narrowly in the California Fish and Game Code than in the ESA; see Chapter 1, *Introduction*, for details.

the Plan (western burrowing owl, least Bell's vireo, and tricolored blackbird) are considered migratory birds and subject to the prohibitions of the MBTA. Actions conducted under the Plan must comply with the provisions of the MBTA and avoid killing or possessing covered migratory birds, their young, nests, feathers, or eggs. As described in Chapter 1, the ESA incidental take permit, once issued by USFWS, will automatically function as an MBTA Special Purpose Permit, as specified under 50 CFR Sec. 21.27, for least Bell's vireo (the only migratory bird listed as threatened or endangered under the ESA) for a 3-year term subject to renewal by the Permittees (see Appendix 5 in U.S. Fish and Wildlife Service and National Marine Fisheries Service 1996). Should any other of the covered migratory birds become listed under the ESA during the permit term, the ESA permit would also constitute a Special Purpose Permit under the MBTA for that species for a 3-year term subject to renewal by the Permittees.

Golden eagle and bald eagle are also protected under the Bald and Golden Eagle Protection Act. Take of golden eagle or bald eagle includes "impacts that result from human-caused alterations initiated around a previously used nest site during a time when eagles are not present, if, upon the eagle's return, such alterations agitate or bother an eagle to a degree that injures an eagle or substantially interferes with normal breeding, feeding, or sheltering habits and causes, or is likely to cause, a loss of productivity or nest abandonment" (72 FR 31133).

## 6.4 Conditions on Specific Covered Activities

Conditions 2–10 pertain to seven specific categories of covered activities: urban development, in-stream capital projects, in-stream operations and maintenance, rural capital projects, rural operations and maintenance, rural residential development, and Plan implementation.

### 6.4.1 Urban Development

Urban development is defined as development occurring inside the urban service area of the three Local Partner cities. Although urban development is assumed in the impact analysis to occur throughout the planning limit of urban growth of each city over the 50-year Habitat Plan permit term, the density of development is not assumed to be urban unless the area is also inside of the urban service area.

There are two conditions on new urban development required by the Plan. Conditions on urban development are limited because of the generally low biological value of resources within urban areas<sup>8</sup>. The two general exceptions are the urban fringe and stream resources. Condition 2 below addresses the edge of new urban development in relationship to the Reserve System; in-stream activities are addressed in subsequent conditions.

---

<sup>8</sup> See Chapter 3 for the rationale for this assumption and Chapter 5 for identification of selected sites in urban areas with high-value resources.

## Condition 2. Incorporate Urban-Reserve System Interface Design Requirements

For the purposes of this Plan, the urban-Reserve System interface is defined as the zone between existing and future urban development and the Reserve System. Because the study area includes three cities, development is anticipated adjacent to the Reserve System in some locations. Because of the influence of urban land uses it is anticipated that some areas generally unsuitable for covered species will border some of the Reserves. Urban buildout adjacent to reserves has the potential to directly or indirectly adversely affect covered species and natural communities within the Reserve System. Sources of such adverse effects may include vandalism, dumping of trash, trampling, unauthorized mountain bike or off-road vehicle use; runoff from adjacent streets and landscaped areas containing lawn fertilizer, pesticides, and vehicle waste (petroleum byproducts); introduction of invasive nonnative species (e.g., pampas grass, French broom, Argentine ants, giant reed); lights and noise from nearby development; unregulated movement of domestic animals; and the potential for covered species to enter developed or urban areas.

Beyond minimizing such direct and immediate impacts, the design of the urban-Reserve System interface will consider indirect and long-term effects, such as runoff from developed areas<sup>9</sup> that can transport harmful substances (e.g., pesticides, automotive fluids, sediment) into reserves; establishment of invasive nonnative species that can disperse from nearby landscaped areas; and structural and biological damage (e.g., soil compaction, creation of unauthorized trails, disturbance of sensitive species) that can result from unmanaged human access and use.

The interface design will address the following key questions, which are based on those proposed by Kelly and Rotenberry (1993) for urban reserves in California.

- What external forces or processes may have a negative impact on covered species and habitats at or near the reserve boundary?
- To what extent are those external forces likely to penetrate the boundary and result directly or indirectly in negative impacts on covered species and habitats? (How permeable is the boundary?)
- Which covered species are likely to exit the reserve and expose themselves to increased risk of injury or death?
- What structures can be built or programs implemented to prevent or mitigate these impacts? For example, how can boundary permeability be altered?

With these questions in mind, site-specific interface design requirements were developed to reduce negative impacts of development on covered species and to

---

<sup>9</sup> In general, development in the permit area will occur downslope from Habitat Plan reserves, so runoff should flow away from reserves. However, because construction grading often alters local drainage patterns, some runoff could flow into reserves if precautions are not taken.

help reduce conflicts if wildlife moves outside the Reserve System. The following sections (*Design Requirements*) describe requirements and opportunities for reducing impacts on covered species and natural communities on Reserve System lands adjacent to urbanized areas.

## Design Requirements

New urban development that occurs adjacent to reserves or areas with moderate or high priorities for land acquisition (see Chapter 5, Section 5.3.1 *Land Acquisition and Restoration Activities*) will incorporate design requirements at the urban-Reserve System interface to minimize the indirect impacts of development adjacent to existing reserves. The relevant jurisdiction (city or County) will determine which development projects are subject to this condition, as well as which components may be required for a particular development. The Implementing Entity will provide technical assistance when needed. Design requirements to be incorporated in new development at the urban-Reserve System interface, include those listed below.

- Locate the proposed development as far from the reserve boundary as possible consistent with other onsite conditions and constraints.
- Where new development occurs, roads will be placed on the interior of the development (i.e., away from the reserve boundary) to reduce the incidence of domestic pets entering the reserves and to isolate this hazard for wildlife that might enter urban areas from the reserves.
- Fences adjacent to yards or home sites will be designed to minimize the risk of pets escaping private yards and entering reserves (e.g., fences will be as tall as permitted by city and county codes, with no spaces between slats).
- Fences shared with reserve boundaries will not contain any gates between the private property and reserve to prevent entrance and trampling of sensitive species or illegal dumping (legal access to reserves will be provided at recreation staging areas).
- No private gates into the Reserve System will be allowed unless required by a pre-existing access easement and identified as an exception by the Implementing Entity.
- Public roads adjacent to reserves (e.g., a road that is aligned parallel to a reserve boundary) will be fenced to reduce unauthorized public access. Locked gates will be inspected regularly to identify any unauthorized locks.
- Development will be designed to minimize the length of the shared boundary between urban areas and the reserves (i.e., minimize the urban edge).
- Outdoor lighting will be of low intensity and will utilize full cutoff fixtures to reduce light pollution of the surrounding natural areas.
- Use of high-intensity lighting (e.g., recreation facilities, commercial parking lots) near reserves will be avoided or, if necessary, placed as low to the

ground as possible and directed away from the reserves to minimize long-distance glare.

- Public facilities such as ballparks and fields that require high-intensity night lighting (i.e., floodlights) will be sited at least 0.5 mile from the reserve boundary to minimize light pollution. Facilities may be sited closer to the Reserve System if the Implementing Entity determines that the lighting system will not be intrusive to wildlife within the Reserve System (e.g., hills block the lighting).
- For any landscaping, non-invasive plants will be required and use of native plants is highly encouraged, consistent with County landscaping guidelines (County of Santa Clara 2009).
- Natural or artificial barriers or other access restrictions may be installed around development to protect sensitive land cover types and covered species in the reserves. Barriers will be designed so they are appropriate for site conditions and resources protected. Some barriers should keep undesirable pets outside of the Reserve, other barriers should keep covered species inside the Reserve, while others should do both. Before installation of a barrier, consider if the area is used by covered species for movement, if the barrier would prevent movement critical for species life cycle, or if the barrier would encourage species to use other less favorable crossings.

Any design requirements incorporated into projects at the urban-Reserve System interface will be located within the development (i.e., not on the Reserve System) with the exception of the fuel buffer described in Condition 10 below. These features will be maintained by the property owners. The Implementing Entity will monitor compliance with these conditions along the reserve boundary concurrent with other monitoring activities described in Chapter 7. Violations will be reported to the applicable local jurisdiction for enforcement.

Although they are not under obligation or requirement, existing developments located adjacent to reserves or lands identified as land acquisition targets for Plan reserves are encouraged to adopt and implement as many of these design requirements as practicable. Local jurisdictions are encouraged to notify and involve the Implementing Entity during the design review process for large projects planned adjacent to the Reserve System.

In addition to the requirements identified above, several other requirements and avoidance and minimization measures are applicable to development near reserves. Project proponents will comply with the following conditions as appropriate.

- Condition 3. *Maintain Hydrologic Conditions.*
- Condition 7. *Rural Development Design and Construction Requirements.*
- Condition 10. *Fuel Buffer.*

### Condition 3. Maintain Hydrologic Conditions and Protect Water Quality

This condition applies to all projects. The implementation of these projects could result in impacts on watershed health through changes in hydrology and water quality.

Currently, all Permittees have stormwater management plans that regulate new development and redevelopment as part of compliance with regulations under National Pollutant Discharge Elimination System (NPDES) permit requirements. An amendment to the Clean Water Act, the NPDES Program is a compliance permit regulating any point source pollution that is discharged into waters of the United States. The San Francisco Bay Regional Board administers the NPDES program in for the Coyote and Guadalupe watersheds. The Central Coast Regional Board administers the NPDES program for the Pajaro Watershed which includes Uvas, Llagas, and Pacheco subbasins. The purpose of this condition is to identify a consistent approach for applying the most important water quality conditions of each Regional Board across the study area (North and South County).

#### Site Design and Avoidance and Minimization Measures

Through development of stormwater management plans and complementary guidance manuals (Santa Clara Valley Urban Runoff Pollution Prevention Program 2006; City of Gilroy 2004; City of Morgan Hill 2004, 2008; Santa Clara Valley Water Resources Protection Collaborative 2006; Santa Clara Valley Water District 2008), the Permittees have identified a set of programmatic avoidance and minimization measures, performance standards, and control measures to minimize increases of peak discharge of stormwater and to reduce runoff of pollutants to protect water quality including during project construction. These avoidance and minimization measures originated, in part, from the measures that area typically required by the Regional Boards and CDFG for projects that have the potential to affect aquatic resources. Many of these avoidance and minimization measures also support the biological goals and objectives of this Habitat Plan. Implementation of these avoidance and minimization measures will reduce the potential for adverse impacts on covered species. **Table 6-2** lists avoidance and minimization measures for all water-related covered activities described in Condition 3, 4, and 5 of this Plan. Each local jurisdiction, or the Implementing Entity in the case of projects conducted by the Permittees, will verify that all appropriate measures in **Table 6-2** are implemented to minimize effects to covered species and their aquatic habitat (see Section 6.8.6). **Table 6-2** lists the source control measures and avoidance and minimization measures from the Permittees' existing stormwater management plans and complementary manuals that are most effective in protecting covered aquatic species and aquatic species habitat.

The requirements listed in **Table 6-2** include general, project design, construction, and post-construction avoidance and minimization measures. Project design measures are site design planning approaches that protect water quality by preventing and reducing the adverse impacts of stormwater pollutants and increases in peak runoff rate and volume. They include hydrologic source control measures that focus on the protection of natural resources and the reduction of impervious surfaces. Construction site conditions include source and treatment control measure to prevent pollutants from leaving the construction site and minimizing site erosion and local stream sedimentation during construction. Post-construction conditions include measures for municipal operations, stormwater treatment, and flow control.

In addition to the avoidance and minimization measures identified above, several other avoidance and minimization measures are identified in other conditions that will help reduce potential impacts to water quality in the study area. Project proponents will comply with the following conditions as appropriate.

- Condition 2. *Incorporate Urban Reserve System Interface Design Requirements.*
- Condition 4. *Stream Avoidance and Minimization for In-Stream Projects.*
- Condition 5. *Avoidance and Minimization Measures for In-Stream Operations and Maintenance.*
- Condition 7. *Rural Development Design and Construction Requirements.*
- Condition 8. *Implement Avoidance and Minimization Measures for Rural Road Operations and Maintenance.*
- Condition 11. *Stream and Riparian Setbacks.*
- Condition 12. *Wetland and Pond Avoidance and Minimization.*

## 6.4.2 In-Stream Projects

In-stream projects—such as flood protection projects, construction of new bridges and repair or rehabilitation of existing bridges or culverts, and water supply capital projects—have the capacity to affect wildlife, aquatic species, and habitats by introducing sediment discharge, disturbing earth and riparian vegetation, and altering hydrologic and hydraulic characteristics of water bodies. Condition 4 is designed to address such impacts.

Several of the in-stream covered activities described in Chapter 2 are also covered activities under the SCVWD proposed Three Creeks HCP. The conditions described below for in-stream projects, as well as for stream and riparian habitat and associated covered species (e.g., Condition 16), are consistent with the Three Creeks HCP.

## Condition 4. Avoidance and Minimization for In-Stream Projects

The primary purpose of this condition is to identify design requirements and construction practices for in-stream projects to minimize impacts on riparian and aquatic habitat. The term *in-stream* is defined for the purposes of this Plan as the stream bed and bank and the adjacent riparian corridor. The adjacent riparian corridor encompasses all mapped riparian land cover (i.e., riparian forest and scrub natural community) immediately adjacent to a stream (see **Figure 3-10** for mapped land cover types). All in-stream projects must be designed to minimize adverse impacts on stream morphology, aquatic and riparian habitat, and flow conditions. Projects that may also affect wetlands or pond areas are addressed in Condition 12, *Wetland and Pond Avoidance and Minimization*.

All in-stream projects, including projects occurring in dewatered reservoirs, will adopt design requirement and construction avoidance and minimization measures to minimize impacts on covered species, natural communities, and wildlife movement. SCVWD and other Local Partners, such as County Parks, have developed avoidance and minimization measures for projects occurring in streams. The Fishery Network of Central California Coastal Counties (called “FishNet 4C” for the original four counties involved) developed the *County Road Maintenance Guidelines for Protecting Aquatic Habitat and Salmon Fisheries* (Fishery Network of Central California Coastal Counties 2004). This manual, while focused on road maintenance activities, provides avoidance and minimization measures that are applicable to all types of in-stream construction activities. **Table 6-2** summarizes these collected avoidance and minimization measures that are required conditions of in-stream covered activities. Avoidance and minimization measures in this table are applicable to the covered activities addressed in this condition as well as in Condition 3, *Maintain Hydrologic Conditions and Protect Water Quality* and Condition 5, *Avoidance and Minimization Measures for In-Stream Operations and Maintenance*. The avoidance and minimization measures address construction staging, dewatering, sediment management, vegetation management, bank protection, drainage, trail construction, and ground disturbance.

All avoidance and minimization measures listed in **Table 6-2** are required unless the avoidance and minimization measure is not appropriate for the activity or field data collected at the site or in comparable areas demonstrate that the avoidance and minimization measure would not benefit wildlife or reduce impacts on natural communities. The Implementing Entity will update the avoidance and minimization measures in **Table 6-2** over time so that they are more appropriate for implementing a specific covered activity or more beneficial for the covered species. Therefore, the Implementing Entity will update this list of avoidance and minimization measures over the permit term as appropriate to reflect new science and avoidance and minimization measure monitoring results. Proposed revisions will be reviewed by the Wildlife Agencies upon submission of each annual report to ensure the successful implementation of the conservation strategy. **Table 6-2** also includes additional avoidance and minimization measures drawn from those currently used by the Local Partners that strive to

reflect current and forthcoming regulations and guidelines for in-stream project design (e.g., the State Water Board's *Wetland and Riparian Area Protection Policy*, described below).

## Types of Projects Subject to Condition

The in-stream projects listed below are subject to the design requirements or construction practices because they are expected to result in impacts on creeks or streams.

- Installation or rehabilitation of flood protection projects and levee reconstruction.
- Bank stabilization projects.
- Geomorphic rehabilitation.
- Gravel enhancement.
- Bridge construction and replacement including vehicular, train, and pedestrian bridges throughout the study area.
- Development of trails in or through the in-stream area (stream bed, banks, and adjacent riparian land cover).
- Culvert installation or replacement.
- Dam repair and seismic retrofit, including dewatering events and development of borrow sites.
- Restoration projects throughout the study area, including creek realignment and erosion management.
- Operation, maintenance and replacement of existing water supply structures such as stream gauges, percolation ponds, and diversions.
- Any other activity that requires construction work within the in-stream area (stream bed, banks, and adjacent riparian land cover).

## Design Requirements

Some impacts on stream and riparian land cover types are expected under the Plan (see **Tables 4-2 and 4-3**). All covered activities subject to this condition will implement the measures listed in **Table 6-2** associated with this condition to avoid or minimize impacts of covered activities on streams and riparian woodland/scrub.

- Applicants must also comply with Condition 7 *Rural Development Design and Construction Requirements* where applicable.
- Applicants for projects with streams on site must follow the setback requirements in Condition 11, *Stream and Riparian Setbacks*.

- Applicants for projects with wetlands or ponds on site must comply with Condition 12, *Wetland and Pond Avoidance and Minimization*.
- Applicants for transportation improvements that include stream crossings must comply with Condition 6, *Design Requirements for Covered Transportation Projects*.

### **Design Criteria for SCVWD Flood Protection Projects**

Flood protection projects shall be designed with an objective to protect or enhance natural channel and habitat functions. Designs will be developed and selected to maintain or improve bank stability, minimize bed degradation or aggradation, protect or improve streambed substrate conditions, protect or increase habitat diversity and complexity, and minimize required maintenance. All covered flood control projects will incorporate the following design elements:

1. Flood protection projects will incorporate support for natural stream functions and allow for natural stream processes to occur consistent with the flood protection goals of the project. Approaches for flood protection will generally include excavation of flood benches based on natural geomorphic conditions, off-stream detention, set-back levees or floodwalls, biotechnical bank stabilization methods, and grade control.
2. Project design alternatives will consider habitat connectivity between the stream and the adjacent floodplain as an objective.
3. Project design alternatives will incorporate native riparian vegetation and in-stream habitat enhancement features, where feasible. Potential enhancement features will be evaluated during the project design review process described below.
4. Bypasses that convey all or a portion of flood flows into channels, tunnels, culverts, or other areas that are isolated from the natural stream will be used only when other options have been evaluated and found infeasible to meet flood protection goals. If used, bypasses will be designed considering local geomorphic and flood characteristics and will minimize impacts to in-stream habitat.

### **Review Process for Covered Flood Control and Levee Reconstruction Projects**

1. Flood control and levee reconstruction projects shall be reviewed by the Wildlife Agencies as described in Chapter 8, Section 8.7.3 *Wildlife Agency Responsibilities*.
2. During the 60% project design stage(s), review and input from the Wildlife Agencies shall be solicited.
3. The Wildlife Agencies providing review will return comments within a mutually agreeable timeline to maintain project schedule. As described in Chapter 8, Section 8.7.3 *Wildlife Agency Responsibilities*, the Wildlife Agencies must review and approve flood control projects to ensure that they are consistent with Habitat Plan requirements.

### Requirements for SCVWD Dewatering Events

The following conditions apply to the dewatering events conducted at SCVWD covered reservoirs. Dewatering events *are necessary* for seismic safety retrofit and major maintenance (see Chapter 2 for a description of these covered activities). Due to the unique characteristics at each dam site, a reservoir-specific dewatering plan will be submitted to the Wildlife Agencies for review and approval prior to the first dewatering event for each reservoir (see Chapter 8, Section 8.7.3 *Wildlife Agency Responsibilities* for details of this process). Dewatering plans will be reviewed and, if appropriate, updated prior to subsequent dewatering events during the permit term. Dewatering plans will address various issues as requested by the Wildlife Agencies during the covered activity review process or as required by the environmental compliance process and will include the following.

- Timing for the initiation and duration of the dewatering event, including the draining and refilling stages of the dewatering event.
- Average, minimum, and maximum flows expected during draining and refilling (flows will be within the limits described in **Table 2-4**) including the duration of periods in which the maximum reservoir release may be made.
- A schedule for re-operation according to applicable rules curves.
- The ability of SCVWD to bypass water or provide other supplemental sources downstream.
- Documentation of in-channel dryback conditions from the previous 3 years, if feasible, and an evaluation of potential increases in the length and duration of dryback related to the dewatering event.
- A qualitative assessment of total flows that could occur downstream of the dam when taking into account stream inflows other than reservoir releases (e.g., stormwater, urban runoff) based on monitoring done during the previous years to assess the level of potential dryback.
- A description of baseline monitoring conducted for California red-legged frog, foothill yellow-legged frog, and western pond turtle in channels to be affected by the drawdown to establish presence of covered species in the channel.
- A description of anticipated effects of the dewatering event on covered species.

In addition, minimization measures included in a dewatering plan could include, but are not limited to, the following.

- Releases will not result in the overtopping of the channel between May and July when western pond turtles are nesting.
- SCVWD will bypass reservoir inflow around the dam and/or provide other supplemental flows downstream of the reservoir.
- SCVWD will consider installing outlets that provide better control over release volumes (beneficial for subsequent dewaterings).

- SCVWD will ramp increases and decreases in flows during dewatering to avoid washing covered species downstream or drying back the channel faster than covered species can adapt and move to new locations.
- Surveys for covered species as required by this chapter prior to re-filling of the reservoir or other construction activities if the reservoir basin has been undisturbed for a period of time. Surveys may be limited to areas that were not disturbed during construction or that were not inundated before construction but may be after construction.
- As reservoir levels decline, the gravel trap at the upstream end of the reservoir, if present, will be isolated and lined to contain inflow to provide for a relocation site for rescued native fish, amphibians, and/or western pond turtle.
- The lined gravel traps will be designed to allow bypass of inflow through or around the reservoir.

### 6.4.3 In-Stream Operations and Maintenance

In-stream<sup>10</sup> operations and maintenance activities covered under this Plan—such as sediment removal, bank stabilization, vegetation management, and debris blockage removal to maintain flows—have the potential to affect covered species by introducing sediment and other pollutants into downstream waterways or by disturbing riparian land cover associated with streams. Condition 5 specifies avoidance and minimization measures for covered operations and maintenance activities within and immediately adjacent to the stream channel. Note that SCVWD’s Stream Maintenance Program is not a covered activity under this Plan and therefore not subject to the conditions of this chapter of the Plan.

## Condition 5. Avoidance and Minimization Measures for In-Stream Operations and Maintenance

The purpose of this condition is to identify avoidance and minimization measures to be applied when conducting in-stream operations and maintenance activities. The measures will help reduce impacts on stream and riparian land cover types and covered species.

### Types of Projects Subject to Condition

The following in-stream operations and maintenance activities are subject to the measures or construction practices described below because they are expected to result in impacts on creeks or streams.

---

<sup>10</sup> *In-stream* is defined for the purposes of the Plan as, “the stream bed and bank and the adjacent riparian corridor.”

- Facility maintenance such as trail, bridge, road, and culvert repair and/or replacement in in-stream areas.
- Natural resource protection such as small bank stabilization projects and removal of debris deposited during flooding.
- Operations and maintenance of flood protection facilities (e.g., dams, armored creeks, detention ponds, streams). Activities may include vegetation management, minor sediment removal, or bank stabilization.
- Operations and maintenance of water supply facilities (e.g., flashboard dams, inflatable dams, stream gages, pipelines, and diversions).
- Non-routine stream maintenance activities conducted by SCVWD (i.e., those activities not covered by SCVWD's Stream Maintenance Program) including extensive removal of vegetation in the Lower Llagas flood control channel.
- Removal of debris blockages except in emergency situations.
- Mitigation and/or monitoring in creeks or adjacent riparian corridors.
- Vegetation management for exotic species removal, such as removal of giant reed, and native vegetation plantings.
- Reservoir dewatering events.
- Reservoir filling.

Avoidance and minimization measures listed in **Table 6-2** will apply to all streams in the project areas as well as to open canals, because these canals may provide habitat for covered species.

## Stream Operation and Maintenance Activities

Several of SCVWD's Stream Maintenance Program avoidance and minimization measures were adapted for inclusion in **Table 6-2** and will be adopted for this Plan. Additional avoidance and minimization measures are identified below to ensure adequate avoidance and minimization of species covered under this Plan during implementation of stream operations and maintenance covered activities. These avoidance and minimization measures were informed by sources that include the Santa Clara Valley Resources Protection Collaborative *Guidelines and Standards* (Santa Clara Valley Water Resources Protection Collaborative 2006) and the SCVWD *Best Management Practices Handbook* (Santa Clara Valley Water District 2008). Throughout the permit term, avoidance and minimization measures listed in **Table 6-2** will be updated through the adaptive management process to reflect current best practices.

## Dam Maintenance Program

All applicable measures in **Table 6-2** will apply to implementation of activities associated with the Dam Maintenance Program (see Chapter 2). In addition,

activities requiring reservoir dewatering will comply with the requirements for dewatering reservoirs described above under Condition 4 *Stream Avoidance and Minimization for In-Stream Projects* and in Chapter 2.

## Pipeline Maintenance Program

While SCVWD's Pipeline Maintenance Program is described in Chapter 2 under Section 2.3.6 *Rural Operations and Maintenance*, some activities have the potential to affect aquatic resources, particularly at blow-off sites. The following avoidance and minimization measures are from SCVWD's Pipeline Maintenance Program Final Program EIR (MHA Environmental Consulting 2007) and will be applied to Pipeline Maintenance Program covered activities in addition to other applicable avoidance measures described in this chapter.

- The discharge location and receiving water will be observed for signs of erosion by a trained individual. If erosion is evident, flow rates will be reduced. If erosion continues to occur, discharges will be terminated until appropriate erosion control measures are installed. Monitoring will be conducted just prior to the start of the discharge and regularly (i.e., every hour, every four hours, every eight hours) during the discharge. Monitoring frequency will depend on the nature of the discharge and the erosion in the area.
- An environmental monitor will walk along each discharge drainage to the termination of the drainage or 500 feet downstream to inspect for erosion after a draining is complete. If erosion is detected, reclamation measures will be taken to correct the erosion. Correction measures shall include recontouring the land to its previous state and revegetating with the appropriate native grass species in the area, if necessary.
- Discharge rates will be ramped up slowly such that the increase in flow rate in the receiving water is gradual and scouring of the channel bed and banks does not occur.
- Flows will be diverted around sensitive, actively eroding, or extremely steep areas to prevent erosion. Flow diversion methods might include use of flexible piping and/or placement of sandbags to alter flow direction, or equivalent measures. The new flow path and discharge point will be monitored for signs of erosion.
- Pipeline discharge for maintenance work would preferentially be performed during winter months, when storm events are more common and when water is naturally highest. Discharge flows are then a minimal portion of overall stream or river flow. If draining must occur during summer or fall, a slow release is mandatory to ensure receiving waters do not experience a substantial temperature change (greater than 2 degrees Fahrenheit).

## 6.4.4 Rural Projects

Rural projects include transportation projects, the South County Airport expansion, the Kirby Landfill expansion, construction of large new recreation facilities (e.g., golf course, sports fields, and extensive picnic areas), capital water supply projects, and private rural residential and commercial development. These rural projects have the potential to affect covered species by removing substantial areas of habitat, disrupting hydrologic patterns, contributing to habitat fragmentation, discharging sediment into water bodies, and resulting in direct mortality of covered species. Conditions 6 and 7 are designed to reduce the severity of such impacts for rural projects.

### Condition 6. Design and Construction Requirements for Covered Transportation Projects

This condition identifies design requirements to minimize the impacts of transportation projects on wildlife movement, occurrences of certain covered species, and important habitat for covered species. All road and rail transportation projects (including the BART extension), or portions thereof, outside streams and within the planning limit of urban growth are exempt from this condition. Road projects in these areas are either within participating cities (i.e., urban areas) or within adjacent County jurisdiction, both of which support relatively dense suburban development. Road projects in these areas are not expected to significantly affect wildlife linkages, occurrences of covered species, or habitat for covered species. All covered transportation projects that cross streams or creeks, including bridges, are subject to Condition 4 above.

Four new road extensions/connections/realignments are proposed outside the planning limit of urban growth during the permit term of this Plan. However, many road improvements, including road widenings, are covered by the Plan (see **Table 2-6**). One new mass transit project is covered by the Plan: the double tracking of the Caltrain line from San José to Gilroy along the existing corridor.

#### Exempt Transportation Projects

The following projects are not subject to the design requirements or construction practices specified in this condition because they are not expected to result in new ground disturbance and are not expected to create new wildlife movement barriers or augment existing barriers.

- Installing traffic signals, signs, pavement markings, flashing beacons, or other safety warnings.
- Painting new lane striping.
- Installing “rumble” strips, channelizers, or other safety markers.
- Installing guardrails or similar structures that are permeable to wildlife.

- Installing ramp metering.
- Regrading existing shoulders (this activity is considered maintenance; see Condition 8).
- Implementing other road safety improvements on less than 1,000 feet of roadway.

All transportation projects that cross creeks are subject to Condition 4 above.

The following projects are also exempt from this condition, due to their small footprint, if the project does not include installation of median barriers or other impermeable safety barriers, and if no mapped or unmapped stream, riparian, serpentine, pond, or wetland land cover types are present, and if the activity is not located in a stream setback. Project lengths must be calculated based on the all new adjacent projects constructed since the time of Plan implementation to determine whether the below thresholds have been crossed.

- Widening roads to add lanes where the project is less than or equal to 1,000 feet in length.
- Realigning roads for safety or operational purposes where the project is less than or equal to 1,000 feet in length.
- Constructing new turn lanes less than or equal to 1,000 feet in length.
- Constructing a new road shoulder less than or equal to 1,000 feet in length.

Outside the planning limit of urban growth transportation projects will adopt design requirements and construction practices to minimize impacts on covered species, natural communities, and wildlife movement (see below). Depending on the type of project, these design requirements and construction practices would be *required* or *possible* (**Table 6-3**).

- **Required (R).** Design element or construction practice is required.
- **Possible (P).** Design element or construction practice is required unless field data collected at the site or in comparable areas demonstrate that the element or practice would not benefit wildlife, and CDFG and USFWS concur with the findings.

## Types of Projects Subject to Condition

The following projects are subject to the design requirements or construction practices because they are expected to result in new ground disturbance, or they may create new wildlife movement barriers or augment existing barriers. Each project category is subject to a specific combination of requirements listed below and in **Table 6-3**.

### Highway Projects

Highway projects are those VTA projects identified in **Table 2-6** as highway projects that call for the expansion of existing highways within the study area.

### **Mass Transit Projects**

The single mass transit project identified for coverage in this Plan is the VTA project identified in **Table 2-6** as *Caltrain South County* which calls for the double tracking of the existing Caltrain corridor.

### **Roadway Projects and Interchange Upgrades**

Major roadway projects and interchange upgrade projects (major roadway projects) are those projects identified in **Table 2-6**. All non-exempt Santa Clara County roadway projects and VTA interchange upgrades identified in **Table 2-6** are subject to the conditions identified **Table 6-3**.

### **Road Safety and Operational Improvements**

These projects include the road projects described in Section 2.3.5 *Rural Capital Projects* that are not listed in **Table 2-6**. Road safety and operational improvements are expected to involve ground-disturbing activities but are not expected to impede or substantially worsen wildlife linkage. However, there may be opportunities for some projects to improve wildlife linkages. These projects are subject to construction and post-construction practices but not to project design requirements (**Table 6-3**).

### **Dirt Road Construction**

Dirt roads may be constructed by the Permittees or private landowners to access their property. These projects are subject to construction and post-construction practices but not to project design requirements (**Table 6-3**).

## **Pre-Design Data Collection for Wildlife Movement**

For transportation projects with the greatest potential to affect wildlife movement (see **Table 6-3** and lists above), it will be important to incorporate requirements that minimize the projects' adverse impacts on wildlife movement. In some cases, transportation projects may present opportunities to upgrade existing structures to improve wildlife movement. For these upgrades to be most effective, they will be supported by data describing movement of wildlife at or near the project site and the likelihood of vehicle collisions based on traffic patterns.

To facilitate better project design and to avoid delays in project construction due to the data collection process, the Implementing Entity will establish a long-term data collection program on wildlife movement in the study area. The primary goal of this program will be to determine the movement patterns of key covered species and other native wildlife throughout the study area. Data collection stations will be established at points along covered transportation projects that are most likely to affect wildlife movement. Wildlife movement will be studied at key sites to determine which species move through the area, when they move and, most importantly, which landscape features are most often used. Techniques used for data collection will vary by site and target species but may include remote cameras, wildlife track pads, and roadkill observations. This program is described in greater detail in Chapter 5. It is expected that several

years (or decades) of data will be available to inform project design by the time that many of these projects reach the design stage. (This monitoring program is in addition to the wildlife corridor feasibility study discussed in Chapter 5.)

Data collection will be required on wildlife movement along the applicable project corridor for at least 1 year prior to project design. These data will be used to select the design requirements most appropriate for the species and conditions particular to the site (see below). If the Implementing Entity has not collected data in the project vicinity and the project timeline does not permit new data collection, then the applicant must apply all the design guidelines on the basis of the best available information for the region and appropriate to the conditions at the project site.

Transportation project applicants will coordinate with the Implementing Entity and Wildlife Agencies on applicable projects as indicated in **Table 6-3** during the conceptual design phase to ensure that as the project moves from conceptual to final design, the project meets the terms of this Plan.

When multiple road expansions are planned for a roadway during the permit term, wildlife crossing needs will be considered for each roadway as a whole, not by road segment. Further, design requirements will be considered for each wildlife species likely to cross the facility (Barnum 2003). These data will inform the design of wildlife movement structures suitable for the site and the species that use the area. In addition, after each project component is installed, wildlife activity along the road will be monitored to assess how wildlife responded to the project, if behavior has changed, and if additional design considerations will be utilized as future projects are implemented along the roadway.

## Transportation Project Design Requirements

To reduce the impacts of construction activities on natural communities and native species within the study area, the design requirements listed below will be implemented for applicable transportation projects (**Table 6-3**). Design requirements are based on the latest techniques for minimizing impacts of transportation projects (Forman et al. 2002; Irwin et al. 2003; Finch 2004; Hilty et al. 2006). Some design requirements may be updated by the Implementing Entity if the best available science indicates that such updates would be more effective at facilitating safe wildlife movement across transportation corridors. Because the effectiveness of road crossings designed for wildlife is an active area of research, frequent advances in design are expected throughout the permit term.

- **Enhance existing undercrossings.** When road expansion projects span an undercrossing, such as a culvert, existing undercrossing structures will be enhanced within safety or engineering limitations to allow for fish and wildlife movement. Existing culverts or other potential crossing points will be enhanced if results of data collection indicate that the existing structure is inadequate. The design requirements of replacement structures will be

determined by the species that have been documented using or attempting to use the site. Wildlife crossings that can serve multiple species will be used whenever possible.

- ❑ **Crossing enhancements.** Crossing enhancements must incorporate design requirements identified for culverts in Condition 4, *Stream Avoidance and Minimization for In-Stream Projects*.
- ❑ **Minimum sizing of culverts.** Culverts must be the minimum length, height, and width necessary to provide safe passage under the road for the target species present at the site (based on data collected as described above). Culvert designs will be based on the best available data at the time. Current recommendations are that culverts designed for medium-size mammals (e.g., San Joaquin kit fox, coyote, raccoon) be 5–8 feet in diameter (although culverts larger than 8 feet in diameter may be needed for longer crossings). Culverts designed for small mammals or amphibians are recommended at 18–48 inches in diameter. Culverts will provide a natural substrate on which wildlife can travel (e.g., open bottom box culvert) when such designs are compatible with the hydrologic needs of the culvert.
- ❑ **Install grating to allow ambient light to penetrate undercrossing.** Culverts will include grating on the inactive part of the roadbed (e.g., road shoulders or median) to allow filtration of ambient light and moisture but minimize noise intrusion. Artificial lighting inside tunnels or culverts will not be used; these devices have not been shown to be effective and may deter nocturnal wildlife. Such devices may also be vandalized.
- ❑ **Fencing design.** Fencing will be required in areas where high mortality rates of species attempting to cross the road occur. Fencing will be used along the perimeter of the roadway to direct animals to undercrossings and minimize their access to the road. Fencing designs will be tailored to the species expected to use the undercrossing and will be based on the best available data on species use and best fencing designs available at the time. For example, fencing for amphibians will be high enough to prevent amphibian crossing but low enough to allow movement of other species (e.g., deer, badgers, etc.). Fencing will extend out from the undercrossing along the road to an appropriate distance that will serve as a barrier to wildlife attempting to cross the road. The distance that fencing extends from the undercrossing will be determined on a case-by-case basis and will consider locations of known collisions in the area. Right-of-way fencing could be designed to serve this purpose. Fencing must be attached to the undercrossing to prevent wildlife from passing through a gap between the undercrossing and the beginning of the fence.  
  
Fencing must be monitored regularly by the facility owner and repairs made promptly to ensure effectiveness. Vegetation must be managed along small mammal and amphibian fencing to reduce the opportunity for these species to climb the fence. Fencing designed for small mammal or amphibian exclusion must be installed at least 8 inches into the soil to prevent small mammals from tunneling under the fence.

Where low-traffic side roads (e.g., ranch roads) cross the wildlife fences along the main roadway, gates will be used whenever possible to avoid creating a gap in the fence that wildlife could move through. The gate will be designed to minimize the gap between the gate and the roadbed. If gates are not feasible, an in-roadway barrier (e.g., wildlife grates) or device that channels species away must be installed to deter wildlife from moving around fences and into the road.

- ❑ **Passage placement.** New passages will only be placed or located in areas that connect two viable habitats so that wildlife is not directed into urbanized areas.
- ❑ **Road or rail barrier designs.** When compatible with vehicle and train safety, road and rail median barriers or shoulder barriers will allow wildlife to cross under or over the barrier in the event they become trapped in the right-of-way. For example, one-way gates could be used to allow movement out of the hazardous zone but not into it.

## Construction Practices

The following construction practices apply to categories of transportation projects listed in **Table 6-3**.

### Avoidance and Minimization Measures for Transportation Projects

- Minimize ground disturbance to the smallest area feasible.
- For construction of new dirt roads, prevent rills (a narrow groove or crack in the road resulting from erosion by overland flow) by breaking large or long bare areas up into smaller patches that can be effectively drained before rills can develop (Fishery Network of Central California Coastal Counties 2004).
- For construction of new dirt roads, disconnect and disperse runoff flow paths, including roadside ditches, which might otherwise deliver fine sediment to stream channels (Fishery Network of Central California Coastal Counties 2004).
- For construction of new dirt roads, prevent gullies by dispersing runoff from road surfaces, ditches and construction sites, by correctly designing, installing and maintaining drainage structures (e.g., road shape, rolling dips, out-sloped roads, culverts, etc.) and by keeping streams in their natural channels. No single point of discharge from a road or other disturbed area should carry sufficient flow to create gullies. If gullies continue to develop, additional drainage structures are needed to further disperse the runoff (Fishery Network of Central California Coastal Counties 2004).
- When constructing or reconstructing a ditch, utilize designs for outlet locations that avoid directly dumping ditch water into surface waters, when practical. If not practical, implement sediment management avoidance and minimization measures to trap sediment before it reaches a stream. Avoidance and minimization measures described in Condition 3 and

Condition 4 will be applied as appropriate (Fishery Network of Central California Coastal Counties 2004).

- When designing or redesigning roads, look for opportunities to restore natural drainage patterns. Install culverts or rolling dips to retain water in its drainage of origin, which will decrease the potential for erosion downstream. On problem roads, look for opportunities to reconstruct the road segment to improve and maintain natural drainage patterns; for example, add rolling dips, emergency water bars and additional cross drains (Fishery Network of Central California Coastal Counties 2004).
- When constructing dirt roads, install road surface and ditch drainage structures frequently enough so that gullies do not form at drainage points and so that the road and drainage system are generally dry (Fishery Network of Central California Coastal Counties 2004).
- Equipment storage, fueling, and staging areas will be sited on disturbed areas or on non-sensitive nonnative grassland land cover types, when these sites are available, to minimize risk of direct discharge into riparian areas or other sensitive land cover types. When such sites are not available, staging will occur on the road used to access the site.
- All species survey requirements of this Plan will be followed within the construction zone (i.e., the limit of project construction plus equipment staging areas and access roads) and the entire road right-of-way. Expanding the survey area beyond the project footprint will help identify covered species and their habitats so that impacts on covered species that occur adjacent to the construction zone can be minimized.
- No erodible materials will be deposited into watercourses. Brush, loose soils, or other debris material will not be stockpiled within stream channels or on adjacent banks.
- Silt fencing or other sediment trapping methods will be installed below the grade of new road construction or road widening activities to minimize the transport of sediment off site.
- Temporary barriers will be constructed to keep wildlife out of construction sites, as appropriate.
- Onsite monitoring will be conducted by a qualified biologist throughout the construction period to ensure that disturbance limits, avoidance and minimization measures, and Plan restrictions are being implemented properly.
- Use existing roads for access and disturbed area for staging as site constraints allow. Off-road travel will avoid sensitive communities such as wetlands and known occurrences of covered plants.
- Active construction areas will be watered regularly to minimize the impact of dust on adjacent vegetation and wildlife habitats, if warranted.
- Portions of the project that occur in streams (e.g., bridge or culvert construction) will comply with Condition 4.

## Post-construction Practices

Following construction, the areas beyond road shoulders and inside the right-of-way will be returned to a pre-project or ecologically improved condition. These actions will likely be applied differently to each road project and will decrease the potential for the spread of nonnative species.

- Invasive plants within the project area and any construction staging areas will be removed to prevent the spread of these species into nearby or adjacent reserves.
- All disturbed soils will be revegetated with native plants and/or grasses or sterile nonnative species suitable for the altered soil conditions upon completion of construction. Local watershed native plants will be used if available. If sterile nonnative species are used for temporary erosion control, native seed mixtures must be used in subsequent treatments to provide long-term erosion control and slow colonization by invasive nonnatives. All disturbed areas that have been compacted shall be de-compacted prior to planting or seeding.
- Vegetation and debris will be managed in and near culverts and under and near bridges to ensure that entryways remain open and visible to wildlife and that the passage through the culvert or under the bridge remains clear.

All structures constructed for wildlife movement (tunnels, culverts, underpasses, fences) will be monitored at regular intervals by the Local Partner facility owner and repairs made promptly to ensure that the structure is in proper condition. For facilities owned by entities not participating in the Habitat Plan (e.g., California Department of Transportation [Caltrans]), the Implementing Entity will secure access and data collection agreements with these entities to allow the Implementing Entity to conduct this monitoring.

## Condition 7. Rural Development Design and Construction Requirements

For this Plan, rural development is defined as any new development that occurs outside of the urban service area at the time the development is permitted under the Plan, or those areas within the urban service area that are only covered for development consistent with rural land uses. The rural development covered activities listed below are subject to this condition and to the applicable permitting process of the local jurisdiction.

- Residential development (e.g., single family homes, subdivisions) consistent with the County General Plan (County of Santa Clara 1994). Ancillary improvements may include privately owned bridges, driveways, access roads, vineyards or orchards, and other accessory structures associated with rural dwelling units.
- Non-residential development consistent with the County General Plan (County of Santa Clara 1994). This includes new commercial facilities

(institutional, industrial) agricultural facilities (mushroom farms, commercial stables, and equestrian event facilities) or similar uses that obtain building, grading and/or other development permits, consistent with local general plans, such.

- Vineyard, orchard, or other farming activity that obtains a building, grading, or development permit from the County or City.
- Residential or non-residential development on the non-urban hillsides of eastern San José (outside the planning limit of urban growth) and in the Coyote Valley Urban Reserve and South Almaden Valley Urban Reserve consistent with the San José General Plan.
- Residential or non-residential development in the Morgan Hill Southeast Quadrant consistent with the Morgan Hill General Plan.
- Residential or non-residential development in the Hecker Pass Specific Plan area consistent with the Gilroy General Plan.
- Projects, including capital projects, implemented by Permittees outside the urban service area.

As described in Chapter 4, rural development in hillside and natural areas that will remain rural has a greater potential for direct and indirect impacts on sensitive habitat and more covered species than urban development in already developed areas for a number of reasons. First, rural development tends to occur on larger parcels or in less constrained sites, affecting larger areas. Second, the existing landscape in hillside and natural areas is generally less disturbed prior to project construction on rural development sites than on urban sites. Third, rural development tends to occur near or in areas with native vegetation and higher biological values, including areas near or adjacent to the Reserve System. Rural development in natural areas tends to increase habitat fragmentation, which degrades or disrupts landscape connectivity. New driveways and roads associated with rural development may create new hazards or barriers to species dispersal. Indirect impacts also occur at both the development site and the landscape level, as rural development can introduce new sources of noise, light and glare, air pollution, and vehicle traffic in more remote areas. Despite the potential for these adverse effects on natural communities and covered species, rural development projects often have greater flexibility to modify designs to reduce or minimize impacts on covered species and natural communities than projects in urban areas.

As described in Chapter 4, existing land use restrictions and requirements also substantially limit the footprint and extent of rural development. For example, almost all of the areas intended to be incorporated into the Reserve System (see Chapter 5) are large land holdings designated as Hillside or Ranchland land uses under the County General Plan. In these areas, the maximum development density allowed is one residence per 20 to 160 acres, based on the average slope of a parcel. Subdivision of sites designated Hillside or Ranchland seldom occurs and this pattern is not expected to change during the permit term due to the physical challenges of development in most of the study area. Under County policies, most subdivision proposals for Hillside parcels are required to cluster

future development and preserve a minimum of 90% of the site as open space. If suitable, these large set-asides could be incorporated into the Reserve System. County policies and regulations also require that grading be minimized in Hillside and Ranchland areas through the site design process, which emphasizes compact development. These land-use restrictions help to minimize the effects of rural development on covered species and natural communities.

The primary goal of this condition is to minimize the potential direct and indirect impacts of rural development in areas that will remain primarily rural on covered species and natural communities most likely to be affected by rural development (see Chapter 4, including **Table 4-1**, for an accounting of which species could be affected by rural development). Additional goals of this condition are listed below.

- Minimize habitat fragmentation and degradation of landscape linkages (e.g., wildlife corridors), including maintaining connectivity between aquatic, riparian, and upland habitats.
- Minimize loss of sensitive land cover types and natural communities including but not limited to riparian woodlands, seasonal wetlands, freshwater marsh, ponds, serpentine grassland, valley oak woodland, knobcone pine woodland, and ponderosa pine woodland.
- Reduce the extent of new roads in remote rural areas in order to reduce negative impacts on species.
- Minimize degradation of streams and maintain the hydrograph to the baseline (defined as the existing conditions at the time of Plan approval), or adjust the hydrograph toward predevelopment conditions<sup>11</sup>.
- Minimize construction-related impacts, including noise; air emissions; erosion and sedimentation; disturbance of native vegetation; and introduction of nonnative, invasive species.
- When designing or retrofitting County facilities, evaluate whether the project can be designed to reduce impervious surfaces to less than pre-project conditions.

This condition integrates existing County requirements with additional avoidance and minimization measures that are intended to reinforce current regulations and support the goals of this condition. The design requirements and conditions for all rural development covered by the Plan are listed below and will be applied as applicable.

### **Design and Construction Requirements**

Projects subject to this condition are required to follow the following measures.

---

<sup>11</sup> The hydrograph will be monitored using existing stream gages within the study area, new gages proposed under the plan, and could be monitored at large developments occurring during the Permit Term, as deemed appropriate by the Implementing Entity.

- Plans presented to local jurisdiction planning staff by private applicants for discretionary approval or a building permit process must identify the proposed impact area and general location of site design features (e.g., residence, access road, leach field, wells, vineyards, accessory structures, etc.). The site plan will show all improvements that will result in permanent land cover impacts (e.g., home, driveway, barn, pool, patio, landscaping, and utilities, etc.), including a 50-foot buffer around all proposed site improvements. The project area plus the 50-foot buffer is called the *development area*. This site plan will also show all site improvements that will result in temporary land cover impacts during construction but that will be returned to the pre-project land cover type within 1 year of completing construction (e.g., leach fields, well pipelines that do not result in permanent habitat disturbance), including a 10-foot buffer around the proposed footprint of the site improvements. Plans do not need to show buffer areas (50 feet for permanent improvements and 10 feet for temporary improvements) that cross property boundaries (e.g., a house 30 feet from a property line only needs to show the buffer area up to the property line). **Figure 6-1** provides an example map of the information required on the site plan. (**Figure 6-1** also defines the development area for the purposes of determining survey areas [see Section 6.8.5 *Item 5: Results of Applicable Species Surveys and Monitoring*] and calculating development fees [see Chapter 9, Section 9.4.1 *Habitat Plan Fees*]).
- Minimize ground disturbance to the smallest area feasible.
- Build close to, and utilize to the extent practicable, existing infrastructure (e.g., existing driveways, utility lines).
- Use existing roads for access and disturbed areas for staging as site constraints allow. Off-road travel will avoid sensitive communities such as wetlands and known occurrences of covered plants.
- Adhere to Condition 10, *Fuel Buffer*.

### Site Hydrology

- Develop only the minimum number of stream crossings necessary to access the property.
- At project sites that are adjacent to any drainage, natural or manmade, exposed soils must be stabilized or otherwise contained on site to prevent excessive sediment from entering a waterway.
- Use of impermeable surfaces surrounding structures must be minimized to the greatest extent possible through the use of alternative design treatments, such as low impact development methods, including but not limited to, permeable pavers, green roofs, and rainwater catchments so that natural infiltration is facilitated and runoff is reduced.
- Consistent with State and Regional Water Quality Control Board regulations, runoff from impermeable surfaces must be directed to natural or landscaped areas, or to designed swales or detention/retention basins to encourage

natural filtration and infiltration. Diversion to a cistern or other onsite stormwater management technique is also allowed and encouraged.

- Avoid and minimize impacts associated with altering natural drainages and contours on the project site. If the site is graded, blend grading into the existing landform as much as possible.
- Leach fields must be sited away from creeks in accordance with the County septic ordinances, as well as at least 100 feet from the reserve boundary. Leach field installation may result in localized soil moisture content and groundwater levels that may have adverse effects on sensitive plants or plant communities in the Reserve System. Leach fields may be sited within the 100-foot setback if site-specific conditions (i.e., topography) adequately minimize effects, or adequate space is not available to site the field elsewhere (i.e., the parcel is too small).
- Adhere to Condition 3, *Maintain Hydrologic Conditions and Protect Water Quality*.
- Adhere to Condition 4, *Stream Avoidance and Minimization for In-Stream Projects*.
- Adhere to Condition 5, *Avoidance and Minimization Measures for In-Stream Operations and Maintenance*.
- Adhere to Condition 11, *Stream and Riparian Setbacks*.

### **Vineyards**

The following conditions apply to new vineyards that are covered by the Habitat Plan (i.e., those requiring a permit from the County or other local jurisdiction) and are encouraged for new and existing vineyards that do not require a development permit.

- During construction, use cover crops, straw mulch, straw wattles/fiber rolls, coconut husks, or other equivalent erosion control mechanism to prevent sediment from being blown or washed from the project site.
- All disturbed areas will be protected during the rainy season (October 15–April 15). Permanent or temporary measures to prevent erosion must be utilized during vineyard planting. Permanent measures must be utilized once planting is completed. Erosion control measures must be in place by October 15.
- Plant vine rows along existing contours to slow runoff and reduce erosion on hillsides (California Sustainable Wine Growing Alliance 2002a).
- A stormwater management system designed for an average storm recurrence interval of not less than 25 years will be installed on the vineyard site. The system will allow excess stormwater runoff to be carried through the vineyard site with minimum erosion and consistent with the overall drainage patterns present in the area. This requirement may be met by either temporary or permanent measures while vineyard planting work is being

carried out, but shall be met by permanent measures by the time vineyard planting work is completed.

- A sediment control system designed to minimize the discharge of sediment from the vineyard site will be installed on the vineyard site. This requirement may be met by either temporary or permanent measures while vineyard planting work is being carried out, but will be met by permanent measures by the time vineyard planting work is completed.
- If open conduits are used as part of the stormwater management system, plant conduits with grasses and other vegetation to filter sediment, pesticides, and fertilizers from runoff and to reduce the potential that the stormwater conduit itself will erode.
- As part of the stormwater and sediment management systems, install vegetated swales, detention basins, extended vegetated buffer, or other similar feature on the downslope edge of the planted area to capture and treat runoff before it enters local streams. This will minimize the amount of sediment, fertilizers, and pesticides that enter local streams.
- Heavy equipment will not be utilized on dirt access roads immediately after rain to prevent roads from turning to mud and sediment from running off the roads (California Sustainable Wine Growing Alliance 2002a).
- Use of natural pest management approaches in place of pesticides is highly encouraged.
- Maintain a buffer of natural vegetation, including grasses, shrubs, or mature trees, around the perimeter of the vineyard to reduce topsoil erosion and provide habitat for birds that will prey on rodents (California Sustainable Wine Growing Alliance 2006).

### **Private Rural Roads**

- Minimize to the maximum extent possible the amount of ground disturbance when constructing roads.
- Ground-disturbing activities associated with road construction should be timed to occur during dry weather months to reduce the possibility of landslides or other sediment being transported to local streams during wet weather.
- If construction extends into wet weather, the road bed will be surfaced with appropriate surfacing material to prevent erosion of the exposed roadbed (Pacific Watershed Associates 1994).
- Avoid, to the extent possible, constructing roads on steep slopes (over 25%) or on unstable slopes.
- If construction on steep slopes is required, construction will be timed for dry weather months to reduce the potential for landslides.
- Adhere to the avoidance and minimization measures for dirt road construction in Condition 6 under *Avoidance and Minimization Measures for Transportation Projects* (see first three bullets under heading).

### Other Requirements

- Maintain as much natural vegetation as possible, consistent with fuel management standards, on the project site.
- Maintain County-mandated fuel buffer (variable width by slope conditions).
- On sites adjacent to reserves, locate the proposed development as far from the reserve boundary as possible consistent with other onsite conditions and constraints and adhere to Condition 2, *Incorporate Urban-Wildland Interface Design Elements*.
- All temporarily disturbed soils will be revegetated with native plants and/or grasses or sterile nonnative species suitable for the altered soil conditions upon completion of construction. Local watershed native plants will be used if available. If sterile nonnative species are used for temporary erosion control, native seed mixtures must be used in subsequent treatments to provide long-term erosion control and slow colonization by invasive nonnatives. All disturbed areas that have been compacted shall be de-compacted prior to planting or seeding.
- All temporarily disturbed areas, such as staging areas, will be returned to pre-project or ecologically improved conditions within 1 year of completing construction or the impact will be considered permanent.
- No plants identified by the California Invasive Plant Council as invasive<sup>12</sup> will be planted on the project site. Planting with watershed local native and/or drought-resistant plants is highly encouraged. This reduces the need for watering as well as the need for fertilizers and pesticides.
- Outdoor lighting will be of low intensity and will utilize full cutoff fixtures to reduce light pollution of the surrounding natural areas.

Project proponents must continue to adhere to all applicable local planning ordinances including: noise ordinances, zoning ordinances, fuel management guidelines for fire buffers, NPDES permit requirements, Water Collaborative guidelines and standards, Santa Clara County grading ordinance, and drainage manual.

## 6.4.5 Rural Operations and Maintenance

Rural operations and maintenance activities—such as operations and maintenance of utility lines and facilities, road maintenance, vegetation management, and mitigation monitoring—have the potential to affect covered species by disturbing nesting covered bird species, leading to sediment discharge, and spreading of nonnative invasive species. Condition 8 would reduce the severity of such impacts.

---

<sup>12</sup> See <[www.cal-ipc.org/ip/inventory](http://www.cal-ipc.org/ip/inventory)> for the latest list of invasive species.

## Condition 8. Implement Avoidance and Minimization Measures for Rural Road Maintenance

Road maintenance activities have the potential to directly affect covered species through management activities such as mowing, and may indirectly affect covered species by introducing sediment and other pollutants into downstream waterways and by spreading invasive weeds. Effects on covered species may be greatest on unpaved roads due to their erosion potential. The County maintains an extensive network of paved and unpaved roads. All roads maintained by the County Roads and Airports Department in the study area are paved, except for a portion of one road<sup>13</sup>. County Parks maintains an extensive network of unpaved maintenance and emergency access roads within their parks that often serve primarily as recreational trails. SCVWD maintains a small network of paved and unpaved roads, mostly on levees and along pipelines. Gilroy and Morgan Hill do not maintain any dirt roads outside of the planning limit of urban growth.

To avoid and minimize these impacts, avoidance and minimization measures were developed to address potential impacts associated with road operation and maintenance activities. The avoidance and minimization measures in this condition are based largely on the guidelines in *County Road Maintenance Guidelines for Protecting Aquatic Habitat and Salmon Fisheries* (Fishery Network of Central California Coastal Counties 2004). This manual, also called FishNet 4C, was developed by six central California counties (Mendocino, Sonoma, Marin, San Mateo, Santa Cruz and Monterey counties) and included input from cities, local Resource Conservation Districts, and water agencies. This manual identifies best management practices to protect water quality and aquatic habitat when implementing routine and emergency road maintenance activities. These guidelines incorporate avoidance and minimization measures from other road maintenance programs (e.g., the Oregon State Department of Transportation's *Road Maintenance Manual*, and the Northern Five Counties Salmon Conservation Group's *A Water Quality and Stream Habitat Protection Manual for County Road Maintenance in Northwestern California Watersheds*) (Fishery Network of Central California Coastal Counties 2004). Avoidance and minimization measures identified in the FishNet 4C guidelines are included in **Table 6-4** as part of this condition. In addition to the avoidance and minimization measures in **Table 6-4**, project proponents will comply with the avoidance and minimization measures listed below. Avoidance and minimization measures identified in this condition will be used for all covered road operation and maintenance activities.

- Projects occurring in streams or riparian setback zone will also comply with Condition 4 and Condition 5 as appropriate.
- Minimize ground disturbance to the smallest area feasible.
- Within the riparian setback zone (see Condition 11), silt fencing or other sediment control device will be installed downslope from maintenance

---

<sup>13</sup> The one unpaved road maintained by County Roads and Airports in the study area is 1.75 miles of Mount Madonna Road between Redwood Retreat Road and Summit Road (the county line).

activities that disturb soil (e.g., blading of fire or access roads within Parks or the Reserve System) to minimize the transport of sediment off site.

- In the course of rural road maintenance, no erodible materials will be deposited into watercourses. Brush, loose soils, or other debris material will not be stockpiled within stream channels or on adjacent banks where it could be washed into the channel.
- Alternatives such as mechanical control will be considered to substantially lessen any significant impact on the environment before using pesticides. Integrated pest management avoidance and minimization measures will be used for all vegetation control. Limitations may occur due to fire management requirements and local integrated pest management ordinances.
- The effects of herbicide and pesticide application will not be covered under the federal permits for this Plan. Herbicides and pesticides will be used only when necessary and will be applied in strict compliance with label requirements and state, federal, and local regulations. Herbicides and pesticides will only be applied when weather conditions will minimize drift and impacts on non-target sites.
- Maintenance activities on rural roads adjacent to natural land cover types will be seasonally timed, when safety permits and regulatory restrictions allow, to avoid or minimize adverse effects on active nests of resident and migratory birds, including covered bird species (western burrowing owl, least Bell's vireo, and tricolored blackbird). This measure is particularly relevant for right-of-way mowing<sup>14</sup>, brush clearing, prevention of disease spread (i.e., sudden oak disease), and tree trimming. Project proponents will coordinate with the Implementing Entity to develop work schedules that optimize logistic, safety, and financial needs while minimizing potential impacts on nesting birds.
- Mowing equipment will be thoroughly cleaned before use in rural areas so they are free of noxious weeds (e.g., yellow star-thistle) and do not introduce such weeds to new areas.
- Maintenance or repair of road medians or shoulder barriers in areas that support natural land cover types (e.g., annual grassland, oak savanna, oak woodland) will not reduce the ability of wildlife of all types to move through or over them, within safety limits. Replacement or repair of road medians will be designed or installed to allow wildlife to move past these structures. Exceptions may be made by the Permittee if significant safety concerns or financial constraints arise.
- All disturbed soils will be revegetated with native plants and/or grasses or sterile nonnative species suitable for the altered soil conditions upon completion of construction. Local watershed native plants will be used if available. If sterile nonnative species are used for temporary erosion control, native seed mixtures must be used in subsequent treatments to provide long-

---

<sup>14</sup> For example, County Parks has a Memorandum of Understanding with the California Department of Forestry and Fire Protection (Cal-Fire) that limits mowing to November to April to minimize fire hazards. There may be other public safety restrictions that limit the ability to achieve this guideline.

term erosion control and slow colonization by invasive nonnatives. All disturbed areas that have been compacted shall be de-compacted prior to planting or seeding.

- Ground-disturbing road maintenance activities, such as regrading, will be timed so that the moisture content of the soil will support recompaction of the soil and reduce the need for an imported water source to achieve soil compaction. Similarly, activities will be timed so that use of heavy equipment will not result in the creation of mud puddles and ruts.
- Regularly scheduled visual inspections of all roads will be conducted to identify sites where erosion is contributing sediment to local streams. Appropriate actions will be taken within the road right-of-way to manage the erosion.
- Flow lines (e.g., culverts and ditches) will be cleared annually to maintain flow lines free of debris.
- Use existing roads for access and disturbed area for staging as site constraints allow. Off-road travel will avoid sensitive communities such as wetlands and known occurrences of covered plants.
- All new public roads that are accessible to general public vehicular use will be paved (this does not include fire roads that may also serve recreational needs).

## 6.4.6 Reserve System Implementation

Reserve System implementation—which includes activities associated with recreation, construction, infrastructure design, and maintenance of the reserves—could result in localized effects on covered species and their habitats. All relevant conditions will be applied to construction and maintenance activities within the Reserve System.

## Condition 9. Prepare and Implement a Recreation Plan

Public access, consistent with the Habitat Plan conservation strategy, will be provided on all reserves owned in fee title by a public agency. Public access to privately owned land under conservation easement will only be permitted with the landowner's consent. See Chapter 10 *Assurances* for more details.

All public access to reserves will be managed according to a recreation plan that will be developed by the landowner (e.g., County Parks, Open Space Authority) and/or the Implementing Entity consistent with the requirements of this condition. Recreation plans will be reviewed by the Implementing Entity for consistency with this condition and integrated into the applicable reserve unit management plan which will be reviewed and approved by the Permittees and the Wildlife Agencies. Wildlife Agency approval of reserve unit management plans

will follow the timelines established in Chapter 5, Section 5.2.5 *Land Management* subheading *Land Management on Reserves*.

The recreation plan will address lands that are acquired for or incorporated into a reserve unit where the Implementing Entity and the land owner determine that recreational and educational uses are compatible with the conservation strategy of this Plan. Each recreation plan will apply to the portion of the reserve unit for which the recreation plan was developed, including existing open space that is incorporated into the unit (existing open space selected for the Reserve System was chosen, in part, for its recreational uses that are compatible with the biological goals and objectives of the Plan).

At a minimum, each recreation plan will contain the requirements listed below.

- Identification of sites within reserves where recreational use is compatible with the goals and objectives of the Plan.
- Identification of acceptable forms of recreation if different from those forms identified in this condition.
- Identification of sites within reserves that contain sensitive land cover types or suitable or occupied habitat for covered species.
- Maps of existing and proposed recreational trails, staging areas, and facilities and of habitat types affected.
- Site-specific methods of recreational use controls.
- Trail and use monitoring methods, schedules, and responsibilities.
- Trail operation and maintenance guidelines and responsibilities. This includes control of active off-trail recreational activities determined inappropriate by Implementing Entity and Wildlife Agencies.
- A framework for enforcement of recreational restrictions and permitting process for restricted recreational uses.
- An evaluation determining if the impact of planned recreational use is within the limits established in the Plan and EIS/EIR, and if planned recreation is compatible with the biological goals and objectives of the Plan.
- Clear triggers for use restrictions or closure based on sensitive biological indicators (e.g., seasonal closures of some trails on the basis of activity periods of covered or sensitive species).

Land acquired for reserves will be closed to all recreational uses until a recreation plan is developed and approved as part of a reserve unit management plan. Existing recreational uses on land incorporated into the Reserve System from existing open space (e.g., County Parks) will continue until the reserve unit management plan and associated recreation plan is completed. Existing open space selected for the Reserve System was chosen, in part, because of its compatible recreation uses with the conservation strategy (see **Table 5-5** and **Figure 5-4**). Until the reserve unit management plan is completed, no additional

recreational uses beyond what is currently allowed will occur on that existing open space incorporated into the Reserve System.

Recreational uses in the Reserve System will be designed to minimize impacts on biological resources and must adhere to the requirements and guidelines listed below.

- Recreation will only be allowed where it is compatible with the biological goals and objectives of the Plan and has less-than-significant impacts on biological resources after implementation of necessary mitigation measures, as described in the EIR/EIS.
- Recreational use and impacts will be monitored by the landowner and the Implementing Entity to ensure that uses do not substantially and adversely affect covered species. If any use is found to be substantially adversely affecting covered species, that use will be discontinued until adjustments in the use can be made to reduce or eliminate impacts (see Chapter 7 for details on monitoring). The Implementing Entity will make decisions about discontinuing or modifying recreational uses in close consultation with the landowner or other applicable reserve management agency or organization, and through a public process.
- Recreational uses allowed in reserves include pedestrian use (walking, hiking, running), dogs on leash, backpacking, nonmotorized bicycle riding on designated trails, horseback riding, wildlife observation and photography, and environmental education and interpretation on designated trails at appropriate sites. Other uses may be allowed by the Implementing Entity as long as they are compatible with the biological goals and objectives of the Plan and users obtain appropriate permissions for conducting activities if needed (e.g., County Parks requires a permit for professional photography).
- Allowable recreational uses will be controlled and restricted by area and time to minimize impacts on natural communities and covered species and to ensure that the biological goals and objectives of the Plan are met. For example, trails will be closed during and immediately following heavy rains and annually winterized to minimize erosion and sedimentation. Additional types of recreational uses (e.g., horse carts on trails) may be allowed if the Implementing Entity determines that they are consistent with the biological goals and objectives of the Plan, CDFG and USFWS concur, and users obtain appropriate permissions for conducting activities if needed (e.g., County Parks requires a permit for use of horse carts).
- Activities will be allowed in keeping with the ecological needs of the given habitat. Any off trail activities and other active recreation not listed above (e.g., outdoor sports, geocaching) unless otherwise authorized by the Implementing Entity are prohibited. Recreational uses will be allowed only during daylight hours and designated times of the year (i.e., limited seasonal closures to protect sensitive covered species; see below for specific examples) unless authorized through a use permit (i.e., backpacking). Exceptions may be made for educational groups and events that are guided by an Implementing Entity staff person or docent approved by the Implementing Entity.

- New staging areas will be developed to the extent possible in areas within reserves that are already disturbed and not suitable for habitat restoration, and that do not contribute to the conservation biological objectives for covered species habitats and/or natural communities. Sites at the edges of reserves will be chosen over sites on the interior of reserves.
- No motorized vehicles or boats will be allowed in reserves, except for use by the reserve manager staff or with the prior approval of the reserve manager (e.g., contractors implementing Plan conservation actions such as habitat restoration and monitoring, grazing tenants, fire-suppression personnel, and maintenance contractors). For reserves under conservation easements, vehicle use will be allowed as part of the regular use of the land (e.g., agricultural operations, permanent residents, utilities, police and fire departments, other easement holders), as specified in the easement.
- When compatible with Plan biological goals and objectives, dogs may be allowed in daylight hours in designated reserves or in designated areas of reserves, but only on leash. Leash law restrictions will be strictly enforced by reserve managers and staff because of the potential impact of dogs on covered species such as San Joaquin kit fox, western burrowing owl, California red-legged frog, and California tiger salamander. Leash enforcement may include citations and fines. Dogs used for herding purposes by grazing lessees must be under verbal control and have proof of vaccination.
- Recreational hunting or fishing within reserves will be prohibited except in limited circumstances. Landowners who have hunted large game (e.g., deer, elk, turkey, or pigs) on their property that becomes part of the Reserve System through a conservation easement will be allowed to continue this use as long as it is consistent with the biological goals and objectives of the Plan. Similarly, hunting for management purposes (e.g., feral pigs) is encouraged where it will contribute to achieving the goals and objectives of the Plan. The Implementing Entity will develop management hunting protocols on new reserve lands in coordination with other agencies who utilize hunting for management purposes (e.g., CDFG). Fishing is currently allowed in some County parks that will be added to the Reserve System. To be consistent with this condition, lakes or ponds in which fishing will continue will not be included in the Reserve System.
- Picnic areas shall be operated during daylight hours only. No irrigated turf or landscaping shall be allowed in picnic areas. To the extent feasible, picnic areas will be located on the perimeter of preserve areas and will be sited in already disturbed areas. No private vehicles shall be allowed in picnic areas, unless the picnic area is at a staging area and except for limited special events approved by the Implementing Entity. Maintenance and emergency vehicles shall be permitted access to picnic areas.
- Backpack camps shall be limited to use by no more than 25 people at each site. With the exception of Americans with Disabilities Act (ADA) service animals, dogs shall only be allowed in backpack camps on-leash. In coordination with the reserve manager, the Implementing Entity will monitor

use and maintenance of backpack camps and may implement a reservation and permitting process for use of backpack camps.

- Public collecting of native species will be prohibited within reserves.
- Introduction of domestic or feral animals, including cats, ducks, fish, reptiles, and any exotic non-naturalized species, is prohibited within the reserves to prevent interference with and mortality of native species, except by the reserve manager for management purposes (e.g., livestock for grazing or dogs for livestock control or protection).
- Trails will be established on existing roads or trails wherever possible to minimize the need for new ground-disturbing activities and to reduce new and ongoing maintenance costs. However, this will be balanced with the need to reroute some poorly designed existing ranch roads that are difficult and expensive to maintain. In some cases, rerouting access roads may have net benefits on biological resources.
- New trails will be designed and operated to be compatible with natural resources protection. New trails will be sited to minimize impacts on sensitive species (including covered species) and natural communities as well as disturbance to adjacent landowners and land uses. Wetlands will be avoided except for educational trails, and trails through woodland or riparian habitat will avoid tree removal or substantial pruning to the extent possible. If tree removal is required, unhealthy, exotic tree species, or trees unlikely to reach maturity due to site conditions (e.g., being shaded out by larger trees) will be targeted for removal.
- Trails built across streams or through riparian corridors will be sited and designed with the smallest footprint necessary to cross the in-stream area. Stream crossings will be perpendicular to the channel and be designed to avoid any potential for future erosion. Trails that follow a stream course will be sited outside the riparian corridor to the maximum extent feasible.
- Trails will not be paved, except as required by law, and will be sited and designed so that they do not contribute to erosion and bank failure. To provide trail access for a range of user capabilities and needs (including persons with physical limitations) in a manner consistent with state and federal regulations, the landowner would site and design new, paved trails in areas within reserves that are already disturbed and do not have the potential to affect sensitive habitat. As common practice, these types of whole-access trails would be sited near staging areas.
- Recreational uses will be controlled using a variety of techniques including fences, gates, clearly signed trails, educational kiosks, trail maps and brochures, interpretive programs, and patrol by land management staff.
- Construction of recreational facilities within reserves will be limited to those structures necessary to directly support the authorized recreational use of the reserve. Existing facilities will be used where possible. Facilities that support recreation and that may be compatible with the reserve include parking lots (e.g., small gravel or paved lots), trails (unpaved or paved as required by law), educational and informational kiosks, up to one visitor

center located in a disturbed or non-sensitive area, and restroom facilities located and designed to have minimal impacts on habitat. Playgrounds, irrigated turf, off-highway vehicle trails, and other facilities that are incompatible with the goals and objectives of this Plan will not be constructed.

- Signs and informational kiosks will be installed to inform recreational users of the sensitivity of the resources in the reserve, the need to stay on designated trails, and the danger to biological resources of introducing wildlife or plants into the reserve.
- New trails will be prohibited within 100 feet of wetlands and streams that provide suitable habitat for covered amphibians and aquatic reptiles or tricolored blackbird, unless topography or other landscape characteristics shield these trails from the covered species habitat or a lack of effect of the trail on the species can be otherwise demonstrated.
- New trails will be prohibited within 250 feet of active western burrowing owl nests. If an owl pair nests within 250 feet of an active trail, Implementing Entity staff will consult with the Wildlife Agencies to determine the appropriate action to take. Actions may include prohibiting trail use until young have fledged and are no longer dependant on the nest.
- When compatible with Plan biological goals and objectives, recreation plans for reserves adjacent to existing public lands will try to ensure consistency in recreational uses across open space boundaries to minimize confusion in the public. Reserves adjacent to non-Plan public lands with different recreational uses will provide clear signage to explain these differences to users that cross boundary lines. The Implementing Entity will be responsible for securing and signing reserve boundaries.

Rare exceptions to the guidelines listed above will be considered and approved by the Implementing Entity and the Wildlife Agencies on a case-by-case basis. Exceptions will be approved only if they are consistent with the biological goals and objectives of the Plan. Any exceptions will be clearly identified in the recreation plan.

## Condition 10. Fuel Buffer

In accordance with state law<sup>15</sup>, all applicable covered activities will remove all brush, flammable vegetation, or combustible growth within at least 30 feet and up to 100 feet of occupied dwellings or structures. The amount of fuel modification necessary shall take into account the flammability of the structure as affected by building material, building standards, location, slope, and type of vegetation. Fuels will be maintained in a condition so that a wildfire burning under average weather conditions would be unlikely to ignite the structure. The intensity of fuels management may vary within the 100-foot buffer of the structure, the most intense being within the first 30 feet around the structure.

---

<sup>15</sup> California Government Code Section 51182 and Public Resources Code 4291.

Consistent with fuels management objectives, steps will be taken to minimize erosion consistent with Condition 7.

Applicable covered activities include construction of new structures in the Diablo Range or Santa Cruz Mountains, or new structures built in grassland, chaparral, oak woodland, or conifer woodland land cover types. This condition also applies to structures built in areas designated by the County as a very high fire hazard severity zone pursuant to Section 51179 of the California Government Code.

If the property line is less than 30 feet from the occupied structure, then the brush and vegetation will be cleared up to the property line in order to maintain compliance with Public Resources Code 4291. Additional brush and vegetation clearing may be required by local or other state laws. To ensure that erosion is minimized, grass and other vegetation within 30 feet of structures will be maintained within this fuel buffer to a height of 18 inches or less. The cost of establishing and maintaining this fuel buffer will be borne by the project proponent. This condition does not apply to single trees or other vegetation that is well-pruned and maintained so as to effectively manage fuels and not form a means of rapidly transmitting fire from other nearby vegetation to a dwelling or structure.

The vast majority of properties adjacent to the Reserve System are expected to be able to create sufficient defensible space within their property to meet this condition. If an additional buffer is deemed necessary by the responsible fire agency, then the private landowner may seek an encroachment permit from the Implementing Entity to meet fire code. In these limited instances, the Implementing Entity may decide to allow a fuel buffer on the reserve side of a property boundary to provide additional protection against wildland fire. The Implementing Entity or land manager would define the allowable activities in encroachment permit to ensure compliance with HCP goals. If this is applied, the fuel management buffer within the reserve will not be credited to the land acquisition requirements in Chapter 5 because this area will be maintained in a disturbed state.

In areas within the Reserve System where management of fuel loads is necessary, the Implementing Entity will trim, mow, conduct prescribed burns, utilize grazing, or otherwise clear vegetation to minimize fuel loads and fire hazards. Various land uses are allowable within the fuel management buffer as long as they reduce fire hazards. Uses such as trails, fire-resistant landscaping, and livestock grazing are compatible with the fuel buffer. Allowable uses must comply with the urban-Reserve System interface guidelines described above.

Creating and maintaining the fuel management buffer within the Reserve System may have impacts on covered species. For example, plants such as Santa Clara Valley dudleya and smooth lessingia may occur in grasslands within fuel buffers. Any impacts on covered plants from fuel buffer management will be counted by the Implementing Entity as an adverse effect that must be offset by conservation of covered plants in the Reserve System (see Chapter 5). In some cases,

maintenance of the fuel buffer may improve habitat for covered plants by reducing cover of nonnative plants.

## 6.5 Conditions to Minimize Impacts on Natural Communities

Conditions 11–14, described below, are designed to minimize impacts on natural communities identified as representing important ecosystems in the Plan area.

### Condition 11. Stream and Riparian Setbacks

This condition applies to all covered activities that may impact streams. This includes all development inside the urban service area where a stream or the stream setback overlaps any portion of the parcel on which a covered activity is being implemented. Outside the urban service area, this includes all covered activities where a stream or stream setback overlaps any portion of the development area or project footprint. Exemptions and exceptions may apply as described below in this condition.

#### Background

The management of stream corridors and associated riparian habitat through the implementation of setbacks has become an increasingly important tool for conserving aquatic and semi-aquatic populations and riparian vegetation and improving water quality. There is strong evidence that riparian buffers of sufficient width protect and improve water quality by intercepting non-point source pollutants in surface and shallow subsurface water flow (e.g., Lowrance et al. 1984; Castelle et al. 1994).

Healthy riparian buffers are also widely recognized for their ability to perform a variety of physical and biological functions other than improving water quality. These functions include stabilizing stream channels; controlling erosion by regulating sediment storage, transport, and distribution; providing organic matter (e.g., leaves and large woody debris) that is critical for aquatic organisms; storing nutrients for the surrounding watershed; reducing water temperature through shading; minimizing flood peaks; and serving as key recharge points for renewing groundwater supplies (DeBano and Schmidt 1989; O’Laughlin and Belt 1995). Riparian buffers also provide habitat for a large variety of plant and animal species. Riparian buffers have been proposed, and in some cases proven, to be landscape components that promote wildlife movement, enhance gene flow, increase connectivity of isolated habitat patches, and provide breeding and foraging habitats for animals (Hilty et al. 2006; Rosenberg et al. 1997).

Within the study area, streams provide important breeding, foraging, and movement habitat for California red-legged frog, foothill yellow-legged frog, and western pond turtle. Riparian woodland, which is found next to many of the study area's streams, provides breeding sites for tricolored blackbird and least Bell's vireo. Riparian woodland habitat also protects water quality by filtering inflow, thus reducing pollutant input and sediment load. Finally, stream and riparian areas provide key linkages connecting conservation areas targeted under the Habitat Plan (see **Table 5-9** and **Figure 5-6**).

Because of the importance of streams and associated riparian woodland for the benefit of covered species and as sensitive land cover types addressed by this Plan, this condition was developed to be as protective as feasible within the land-use constraints of the local jurisdictions and financial constraints of the Habitat Plan. The following principles were developed to guide the stream and riparian setback condition for this Plan.

- Stream habitat and functions are very difficult to replace once lost; in some cases they cannot be replaced.
- Stream setbacks will be required for all covered activities occurring near streams and riparian areas to minimize effects on covered species as required under the ESA and NCCPA. Additional protections adjacent to streams may also be required for urban redevelopment projects.
- Each of the cities participating in the Habitat Plan, as well as the County, has either setback regulations (Morgan Hill) or policies (San José, Gilroy, County of Santa Clara) currently in place. However, these regulations and policies are not consistent among the jurisdictions. A condition is needed that will make regulatory guidance consistent for all covered activities across all jurisdictions. All covered activities must adhere to both the applicable existing local regulations and the requirements of the Plan.
- The main goal of the stream setback requirement is to minimize further degradation of stream and riparian communities from implementation of covered activities and to maintain basic biological and physical functions of stream and riparian systems.
- The purpose of the stream setback requirement within the urban service area is to, at a minimum, protect stream and riparian communities that provide habitat for covered species because these habitats are unique and cannot be conserved elsewhere within the study area.

Protection of streams and adjacent riparian vegetation under this condition would conserve habitat for California red-legged frog, foothill yellow-legged frog, western pond turtle, and least Bell's vireo. All of these species use stream and riparian habitats as either primary or secondary habitat, as described in Chapter 3, *Physical and Biological Resources*.

An analysis was performed to determine the overall value of the setback for protecting covered species' habitat. Modeled habitat protected by the setback was quantified and compared to the level of protection provided by the Reserve System alone. In GIS the habitat models for four covered species (California

red-legged frog, foothill yellow-legged frog, western pond turtle, and least Bell's vireo) were overlaid with the expected locations and widths of riparian setbacks outside of the planning limit of urban growth (setback avoidance is not required inside the urban service area and so those areas were not included in this analysis) for all covered activities except rural residential development (exact location of rural residential development is not known at this time and thus could not be included in the analysis). Assuming all of these covered activities occur, an additional 2,855 acres (28%) of modeled breeding (primary) habitat for California red-legged frog and an additional 348 miles (50%) of modeled habitat (primary and secondary) for foothill yellow-legged frog would be avoided. Also, implementation of the stream setback would avoid an additional 837 acres (55%) of modeled habitat for least Bell's vireo. Setback benefits to these species and western pond turtle are summarized in **Table 6-5**. Stream habitat for covered species will likely overlap (i.e., miles and acres referenced in the table and above are not additive).

## Definitions

The following terms are defined for this condition. These definitions are also found in the glossary (**Appendix A**).

**Riparian habitat or riparian vegetation:** Riparian vegetation is associated with river, stream, or lake banks and floodplains. Riparian vegetation is also defined by USFWS (2009) as plant communities contiguous to and affected by surface and subsurface hydrologic features of perennial or intermittent lotic and lentic water bodies (i.e., rivers, streams, lakes, or other watercourses). Riparian areas have one or both of the following characteristics: 1) distinctively different vegetation than adjacent areas, 2) species similar to adjacent areas but exhibiting more vigorous or robust growth forms due to the greater availability of surface and subsurface water.

**Stream:** A watercourse that flows at least periodically or intermittently through a bed or channel having banks. This may include watercourses having a surface or subsurface flow that supports or has supported riparian vegetation, fish or other aquatic life. In the context of the Habitat Plan, a watercourse must meet SCVWD "*Criteria to Verify or Identify a Watercourse as a Stream*" discussed below under *Framework* (Santa Clara Valley Water Resources Protection Collaborative 2006) to qualify as a stream.

**Reach:** A section of a stream. Reaches are defined based on a specific need (e.g., monitoring) and do not necessarily reflect a standard set of characteristics.

**Perennial stream:** A stream with year-round surface flow that is supplied by both rainfall runoff and groundwater, as well as by substantial dry-season inputs (e.g., runoff).

**Intermittent stream:** A stream that is supplied by both rainfall runoff and groundwater. Intermittent streams tend to be seasonal, with flow during the rainy season and into the late spring or early summer.

**Ephemeral stream:** A stream that flows only in response to rain events and receives no groundwater input. As defined in the Habitat Plan, ephemeral streams will not include irrigation ditches, underground streams, or drainages and swales that have neither defined bed and bank nor evidence of scour or sediment transport. All other ephemeral drainages that qualify as streams will be considered under the Habitat Plan.

## Framework

This condition will apply to all covered activities, including those within the Reserve System. This condition also has exemptions and exceptions as described in subsequent sections below.

The width of the setback is driven by the following criteria:

- stream community,
- slope, and
- location of the covered activity in relation to the urban service area of each local jurisdiction.

Each of these criteria is described below.

### Stream Community

Stream communities are grouped into two simplified categories for the purposes of this condition. These categories are based on broad definitions of the biological characteristics of those communities and correspond to the level of habitat quality for covered species and sensitive riparian communities within the study area. Categories for the stream setback requirement are provided below.

- **Category 1.** This stream type has sufficient flow to support covered species and riparian habitat. These streams include perennial streams and some intermittent streams. These streams are typically larger than ephemeral drainages and support movement of covered species along the length of the stream. The ability of these streams to also support healthy riparian habitats bolsters the ecological value of the stream. This category also includes all in-channel ponds downstream of reservoirs. These streams are shown in **Figure 6-2**<sup>16</sup>.
- **Category 2.** This stream type may not have sufficient flow to support covered species and riparian habitat. These streams include all ephemeral streams and some intermittent stream reaches. These reaches provide minimum support of water-quality functions and primary breeding habitat for

<sup>16</sup> **Figure 6-2** may be periodically updated by the Implementing Entity in consultation with the Wildlife Agencies as new data becomes available.

covered species. Category 2 streams are not specifically mapped as part of the Habitat Plan. They include both identified streams (named creeks and USGS blueline creeks) that are not classified as Category 1 streams (as shown in **Figure 6-2**) and other unmapped streams that meet the “Criteria to Verify or Identify a Watercourse as a Stream” as defined below.

Categories are applied to reaches of streams as opposed to entire streams. This is because almost all streams begin in the uppermost portions of their watersheds as ephemeral streams and gradually become intermittent or perennial and they move downslope and accumulate flows from the watershed and, sometimes, the groundwater basin. As such, a single stream may contain both Category 1 and Category 2 reaches.

The mapped stream network for the Habitat Plan does not differentiate between perennial, intermittent, and ephemeral drainages. However, SCVWD developed a map of all fish-bearing streams in the study area. While fish are not covered by this Plan, presence of fish is a good indicator of the stream type. For example, ephemeral streams do not generally support fish. As such, the stream categories are identified using fish-bearing or non-fish bearing streams as a proxy for Category 1 and Category 2 streams, respectively. Reaches for which fish data are unknown are assumed not to support fish and are included in Category 2. Category 2 reaches cannot occur downstream of a Category 1 reach.

#### **Criteria to Verify or Identify a Watercourse as a Stream**

While all Category 1 streams are mapped by the Plan, not all Category 2 streams are mapped. If a watercourse is not mapped by the Plan, but does meet the following criteria, it will be classified as a Category 2 stream. The following is based on the *Santa Clara Valley Water Resources Protection Collaborative* (2006).

A watercourse which does not appear to fit into one of the two described stream categories may be considered a stream if the director of the planning department of the local jurisdiction determines that the watercourse complies with all of the following three criteria:

1. the watercourse is hydrologically connected to a waterway above and below the site or is connected to a spring, headwaters, lake, and/or bay based on satisfying at least one of the conditions identified in paragraph (A) below; and
2. the watercourse is within a defined channel which includes a bed, bank, and exhibits features that indicate actual or potential sediment movement based on satisfying at least one of the conditions identified in paragraph (B) below; and
3. the watercourse occupies a specific topographic position based on satisfying at least one of the conditions identified in paragraph (C) below.

In determining whether the subject watercourse possesses these three features, the following criteria will be examined by the Local Partner with jurisdiction over the covered activity. If necessary, this determination may require the

technical expertise and recommendations of a qualified biologist, hydrologist, or other qualified professional. In addition, the Local Partner with jurisdiction over the covered activity may require the project proponent to provide additional information as deemed necessary to determine if the watercourse satisfies the three criteria listed below.

This process will not be used to determine if a CDFG Streambed Alteration Agreement will be required pursuant to Section 1600 et seq. of the California Fish and Game Code or to determine if a Corps Section 404 Clean Water Act permit will be required.

**A. Hydrologic Connectivity**—Criterion #1 above will be considered met if any of the following conditions are present:

1. Stream headwaters, springs, in-channel culverts, underground seepage, or groundwater flow are present and capable of providing hydrologic connectivity to recognized watercourses. Sections of stream placed underground by manmade infrastructure (e.g., culverts) are not considered streams for the purpose of this condition except as noted in paragraph B item 4 below.
2. Streams may become connected across or over manmade improvements such as roads (e.g., a temporary connection during a storm event). Except for stream channel improvements, water flowing across or over such improvements within the public right-of-way is not considered a stream. Sections above and/or below this connectivity are streams if they meet the other required features.
3. Springs are present and are considered part of a stream if located above (uphill from) stream initiation.

**B. Channel Form**—Criterion #2 above will be considered met if any of the following conditions are present:

1. The watercourse has a stream channel, beginning at the point of bed and bank initiation, which may be natural, altered, or engineered.
2. The stream channel must have enough flow under present-day conditions to maintain channel form and to move sediment. A non-engineered stream channel bed and bank are created and maintained by erosion and sedimentation, thus the presence of a channel with bed and bank is itself evidence of sufficient flow. Flow volume or timing is not criteria for stream determination.
3. The stream channel has evidence of scour, sedimentation, sediment sorting, undercut banks and/or other erosion, deposition, or transport features—all of which support sediment movement.

Engineered or altered channels exist and are partially or wholly made of earth, concrete, rip rap, or other materials. The hardened nature of these channels bed and banks, and a lack of available sediment along the channel reach, may prevent signs of sediment movement or scour. Such channels need not have explicit evidence of sediment transport.

4. A currently underground stream was filled without appropriate permits from all applicable regulatory agencies (federal, state, and local) or is underground due to a landslide.

**C. Topographic Position**—Criterion #3 above will be considered met if any of the following conditions are present:

1. The watercourse is either a ‘U’ or ‘V’ shaped channel typically located at the low point of a macro-topographic feature.
2. The watercourse consists of bowl, ‘U’, or ‘V’ shaped topography with high points draining to valley or ravine as part of a large drainage network leading to large streams, lakes and/or a bay.
3. The watercourse located on flatland consists of shallow bowl or ‘U’ shaped topography. Generally these streams flow from the hills toward a bay following the slope of the land.

Stream topography can be indicated on a topography map by a ‘U’ or ‘V’ shape pointed in the uphill direction.

**Slope**

Slope is an important determinant of soil stability and therefore erosion and sedimentation rates into streams. Steeper slopes erode faster and are more susceptible to disturbance by the covered activities. To account for these factors, stream setback requirements are greater on steeper slopes. The slope categories developed for the Habitat Plan were based on slope-stability categories in local codes and guidelines. Two slope categories were created. Slope categories are as follows.

- **0%–30% Slopes.** Generally stable slopes. This category does not require additional setbacks beyond those identified above.
- **>30% Slopes.** Increasingly unstable slopes. This category requires increase protection and greater stream setbacks.

If the development area as described in Condition 7 is located within 200 feet of a Category 1 stream, the project proponent will include site topography on the development area map (see Section 6.8.2 *Item 2: Project Description and Map*) in 5-foot intervals in elevation. The project proponent will also calculate the average slope of the development area to determine how this criterion is applied. Slope is defined as the average natural slope of the land within the proposed development area based on an engineered site plan. The average slope is determined by the formula:

$$S = (I * L / A) * 100, \text{ where}$$

*S* is the average slope of the area in percent; *I* is the contour interval in feet; *L* is the combined length of contour lines in feet; and *A* is the area of the development area. Average site slope will be calculated by a registered civil engineer or licensed land surveyor. **Figure 6-3a** illustrates an example setback based on slope.

### Urban Service Area

Different setback distances will be applied depending on whether the covered activity occurs within the urban service area<sup>17</sup> (as adopted and mapped by LAFCO and defined by each city's General Plan at the time of adoption of the Habitat Plan) or outside the urban service area. Within the urban service area of San José, Morgan Hill, and Gilroy, there is typically extensive existing urban development. Due to past land-use policies, this development may have limited or no setbacks from streams. As such, these areas tend to be developed or highly altered from a natural state and the overall habitat value for covered species is less than in the rural areas. The stream setback requirement for covered activities within the urban service area is therefore modest and consistent with existing land uses. This setback also recognizes the limited potential for new development within the urban service area to provide stream protections.

Outside of the urban service area, stream setbacks are greater to maximize protection of existing stream functions and values and to provide additional opportunities for stream and riparian protection and restoration (see Chapter 5). Stream setbacks outside the urban service area take into account the opportunity to establish protective setbacks and to pro-actively prevent degradation seen within the urban service area from past development. The difference between setbacks inside and outside of the urban service area reflects the fact that lands within the urban service area provide a minimum amount of habitat in support of basic ecological functions including connectivity for covered species, while stream and riparian habitat outside of the urban service area will be instrumental in successful implementation of the conservation strategy.

### Required Setbacks

Stream setback requirements have been developed on the basis of an extensive literature review of applicable research from both local and national sources (**Table 6-6**) and in consultation with the Wildlife Agencies. Scientific studies to determine minimum setbacks typically recommend relatively modest setbacks (an average of 58 feet) to protect water quality (e.g., sediment and nutrient loading). Recommended setbacks to enhance stream ecology were greater and ranged from 85 to 220 feet with an average of 132 feet. Setbacks intended to provide protection for plants and wildlife were the greatest and ranged from 30 to 1,600 feet, with an average range of 335 to 410 feet (**Table 6-6**).

Working from scientifically rigorous definitions of appropriate setbacks, further refinement of setbacks was coordinated with the Local Partners to determine setback widths that, while consistent with the literature, limited the number of situations in which the setback would create undue hardship upon property owners or be infeasible to implement on a consistent basis (the setback would

---

<sup>17</sup> The urban service area was used instead of the planning limit of urban growth because the urban service area represents the current boundary of urban development, not the future boundary after implementation of all covered activities. The Local Partners felt strongly that stricter riparian setbacks should be applied outside the urban service area to maximize protection of stream and riparian areas prior to urbanization of these areas.

create a large number of property exemptions). As such, the setbacks identified for this Plan (35 to 250 feet) balance the need to protect ecological functions with surrounding land uses and private property constraints.

A stream setback, measured from top of the stream bank, will be applied to all covered activities as shown in **Table 6-7**. To facilitate implementation of this condition, required setbacks are described below based on project location. **Figures 6-3a through 6-3d** illustrate different applications of the setback.

### **Inside the Urban Service Area**

Inside the urban service area at the time of Plan adoption, the setback for Category 1 streams is 100 feet (**Figure 6-3b**). The setback is increased by 50 feet for parcels with slopes greater than 30% to compensate for increased slope instability and higher anticipated rates of erosion. In addition, if the site supports riparian vegetation the setback is equal to either the riparian edge plus a 35 foot buffer or the setback as defined above, whichever is greater.

The setback for all Category 2 streams is 35 feet regardless of location or slope (see **Figure 6-3c**). In addition, if the site supports riparian vegetation, the setback is extended to include the riparian edge plus a 35-foot buffer. The 35-foot buffer is based on a minimum setback distance of 33 feet suggested for sediment and nutrient reduction (Corley et al. 1999). Ephemeral streams, while constituting the majority of streams affected by this condition, are not commonly mapped due to inherent difficulties in mapping ephemeral tributaries in the study area. Unmapped ephemeral streams will only be subject to the required setback if the criteria for defining a watercourse discussed under *Framework* are met for hydrologic connectivity, channel form, and topographic position (Santa Clara Valley Water Resources Protection Collaborative 2006). The applicable local jurisdiction is responsible for making determinations of whether a watercourse qualifies as a Category 2 stream and for implementing setbacks. Each local jurisdiction may also choose to extend the setback beyond 35 feet in cases where site-specific slope and geological characteristics warrant increased protection.

If the project proponent complies with the stream setback when implementing covered activities (i.e., the project avoids the setback), the area of the setback will be excluded from the development fee calculation for the project. The project will be tracked as the parcel or development area excluding the avoided setback so that local jurisdictions are able to identify new impacts in future project applications.

### **Outside the Urban Service Area**

Outside of the urban service area, setback requirements are greater. For Category 1 streams the setback distance is 150 feet (see **Figure 6-3d**). The setback is increased by 50 feet for slopes greater than 30% to compensate for increased slope instability and higher anticipated rates of erosion (**Figure 6-3a**). In addition, if the site supports riparian vegetation, the setback is either the riparian edge plus a 35-foot buffer or the setback described above, whichever is greater.

As described above for required setbacks “*Inside the Urban Service Area*,” the setback for all Category 2 streams is 35 feet regardless of location or slope (**Figure 6-3c**). If the site supports riparian vegetation, the setback will extend from the riparian edge plus a 35-foot buffer.

Unless a covered activity meets the “Exemption” criteria or is granted a stream setback exception, as described below, implementation of covered activities is prohibited within the stream setback.

Project proponents of projects located outside the urban service area must ensure that the development area does not encroach into the stream setback unless an exemption or an exception is applied. Projects or portions of projects that qualify for an exemption or exception are described below.

If a project proponent chooses to offer a conservation easement onstream setback areas, and the Implementing Entity and Wildlife Agencies approve, the contribution of the area placed under conservation easement may offset development fees as described below under *Fees and Conservation Easements*, and the land will become part of the Reserve System and contribute to the Plan’s requirements for riparian preservation (**Table 5-13**).

## Exemptions

The exemptions below apply regardless of location. If a covered activity qualifies for an exemption, a stream setback is not applied and the project proponent is not required to comply with this condition. However, other conditions may still apply and the project is still required to pay all applicable fees (e.g., land cover fee, wetland fee) as described in Chapter 9. Exemptions from the stream setback include the following.

1. Any activity that is not a covered activity and not subject to the Habitat Plan or its conditions.
2. Activities listed as exempt in Section 6.2.
3. Development on parcels less than 0.5 acre.
4. Covered activities that require work within or adjacent to streams such as bridges, levee maintenance and repair, flood-protection projects, stream maintenance, outfall installation and maintenance, flood-protection capital projects, dam-related capital projects.
5. Recreational trails (see Condition 4 and 9 for details on trail siting).
6. Replacement of utilities that result in no new permanent disturbance to the riparian corridor during construction and operation and generate only temporary loss of habitat. (This exemption does not apply for utility projects that result in new permanent riparian impacts.)
7. Stream crossings essential to provide a means of access to parcel or facility.

## Exceptions

Stream setback policies that apply to a large number of parcels with varying characteristics require a clear and practical set of exceptions. The term exception means an allowance for reductions in mandated setback distances necessary to allow reasonable use and development of a property based on the variety of constraints and factors that may affect the property. In situations where exceptions are granted, portions of this stream setback condition may still apply. Exceptions will be used in a minority of cases with special circumstances that limit or restrict the ability of a landowner to fully apply the stream setback. For example, geologic and seismic hazards, unusual lot size or configurations, unusual slope, or grading and access issues may present site constraints that require exceptions to the stream setback condition in order to allow reasonable development of a site consistent with local land use regulations.

For all proposed exceptions to the stream setbacks (inside or outside the urban service area), exceptions will be considered based on the following factors:

1. The existence of legal uses within the setback.
2. The extent to which meeting the required setback would result in a demonstrable hardship (i.e., denies an owner any economically viable use of his land or adversely affects recognized real property interests) for the applicant.
3. The extent to which meeting the required setback would require deviation from, exceptions to, or variances from other established policies, ordinances or standards regarding grading, access, water supply, wastewater treatment, disposal systems, geologic hazards, zoning, or other established code standards.
4. The stream setback exception does not preclude achieving the biological goals and objectives of the Habitat Plan or conflict with other applicable requirements of the Habitat Plan and local policies.

Regardless of project location, stream setback exceptions may not reduce a Category 1 stream setback to less than a distance of 50 feet for new development or 35 feet for existing or previously developed sites with legal buildings and uses (**Figure 6-3b**). All applicable fees must be paid for areas granted an exception.

Exceptions may be requested through the standard application process described in Section 6.8, or through a separate request process. Applicants must apply for a stream-setback exception through their local jurisdiction. All private applications for stream-setback exceptions must be reviewed and approved by the local jurisdiction. For projects implemented by a local jurisdiction, exception requests must be made to the Implementing Entity. The findings required to approve the stream setback exception must be supported by factual information and judgments in the record.

As part of the review process, the local jurisdiction or the Implementing Entity must consider the implications of a reduced setback on the riparian system and

covered species, progress toward the biological goals and objective of the Plan, and potential effects on adjacent properties. The local jurisdiction or the Implementing Entity must make written findings that document these considerations and the rationale for the stream-setback exception (see below for specific required findings). The local jurisdiction or the Implementing Entity may require technical reports from qualified professionals or consultants to support the application or request. For example, for any significant proposed reduction, a report by a qualified biologist, stream hydrologist, registered engineer, or other professional may be required as a basis for making necessary findings. Please see Section 6.8.5 for definition of a “qualified biologist.”

If the stream setback exception is granted at an administrative level (Zoning Administrator) or by a designated decision-making authority (Planning Commission), local agencies must include provisions that allow appeal of this decision to the elected legislative body of the applicable agency. Applicable fees may be imposed by the legislative body for processing such appeals, as well as for the original exception requests.

Prior to granting the exception, the local jurisdiction will provide the exception request and proposed decision to both the Implementing Entity and the Wildlife Agencies for review and comment. The Implementing Entity and Wildlife Agencies will have 30 days to review the request and provide a written response. A local agency cannot take an action until after that 30 day-period. The Implementing Entity will compile a list of all exceptions granted each calendar year for inclusion in the annual report to the Wildlife Agencies.

## **Fees and Conservation Easements**

If the stream setback is precluded from future development by a permanent conservation easement offered voluntarily by the landowner, and the easement is acceptable to the Implementing Entity and Wildlife Agencies and consistent with the Plan Reserve System (as described in Chapter 8, Section 8.6.3), a portion of the land cover fee for the covered activity (i.e., the fee for impacts to land cover types outside of the setback) may be waived by the Implementing Entity. If the value of the easement, in terms of area and resource value, exceeds the fee, credit cannot be “banked” for other projects (i.e., the Implementing Entity will not compensate for excess credit). Partial fee waivers for setbacks will be determined on a case-by-case basis by the Implementing Entity according to the criteria in Chapter 9, Section 9.4.1, subheading *Land Provided in Lieu of Development Fee*.

Each local jurisdiction may also consider imposing a conservation easement as a requirement for development approval when there is a direct nexus between the effects or impacts of a project and the need for an easement. The Implementing Entity will provide technical assistance to the local jurisdiction to determine whether a conservation easement is warranted. An easement must also demonstrate rough proportionality with the impact of the project.

## Condition 12. Wetland and Pond Avoidance and Minimization

The purpose of this condition is to minimize direct and indirect impacts to wetlands and ponds and in some cases, avoid direct and indirect impacts to high quality wetlands and ponds. Direct impacts are those that directly affect a wetland or a pond within its mapped boundary (see Section 6.8.4 *Item 4: Map of Wetlands and Waters* for a description of mapping direct impacts to wetlands). Project proponents are required to pay a wetland fee for impacts to wetlands and ponds to cover the cost of restoration or creation of aquatic land cover types required by this Plan (see Chapter 9 for details on this wetland fee). Covered activities can avoid paying the wetland fee if they avoid impacts to the wetland.

All project proponents will implement the following actions to avoid and minimize impacts of covered activities on wetlands and ponds.

### Planning Actions

- Projects must be designed to avoid and minimize impacts to wetlands to the maximum extent practicable.
- Applicants with streams on site must follow the stream setback requirements in Condition 11.
- Applicants for coverage under the Plan must follow the requirements and guidelines in Condition 3 to minimize the effects of development on downstream hydrology, streams, and wetlands.

### Design

- Locate septic facilities, if used, at least 100 feet from the edge of a wetland or pond if space allows.
- If the runoff from the development will flow within 100 feet of a wetland or pond, install vegetated stormwater filtration features, such as rain gardens, grass swales, tree box filters, or infiltration basins, to capture and treat flows.
- Plant native vegetation (shrubs and small trees) between the wetland or pond and the development such that the line of sight between the wetland or pond and the development is shielded.
- If during the environmental review process it is shown that a project has adverse indirect impacts to the wetland's function (change in hydrological functions, etc.), the project will be required to avoid these indirect effects, as determined on a case-by-case approach by the local jurisdiction, in consultation with the Implementing Entity. If a Local Partner is carrying out the activity, it will coordinate avoidance measures with the Implementing Entity. Wetlands that are not completely avoided, including indirect effects, will be considered permanently impacted and will count towards the impact

caps described in **Table 4-2** and will be assessed fees as described in Chapter 9. If however, the local jurisdiction demonstrates to the Wildlife Agencies that the wetlands to be indirectly affected are highly degraded prior to project impacts, and the Wildlife Agencies agree, impacts will not be counted toward the impact caps described in **Table 4-2** and fees will not be assessed. “Highly degraded” wetlands could include, but are not limited to, those that are indirectly affected by surrounding development or agriculture to the extent that hydrology, water quality, or habitat for covered species is adversely affected.

## Construction Actions

- Personnel conducting ground-disturbing activities in or adjacent to wetlands and ponds will be trained by a qualified biologist in these avoidance and minimization measures and the permit obligations of project proponents working under this Plan.
- All wetlands and ponds to be avoided by covered activities will be temporarily staked in the field by a qualified biologist to ensure that construction equipment and personnel avoid these features.
- Fencing will be erected along the outer edge of the project area, between the project area and a wetland or pond. The type of fencing will match the activity and impact types. For example, projects that have the potential to cause erosion will require erosion control barriers (see below), and projects that may bring more household pets to a site will be fenced to exclude pets. The temporal requirements for fencing also depend on the activity and impact type. For example, fencing for permanent impacts will be permanent, and fencing for short-term impacts will be removed after the activity is completed.
- Appropriate erosion control measures (e.g., fiber rolls, filter fences, vegetative buffer strips) will be used on site to reduce siltation and runoff of contaminants into wetlands, ponds, streams, or riparian woodland/scrub. Filter fences and mesh will be of material that will not entrap reptiles and amphibians. Erosion control blankets will be used as a last resort because of their tendency to biodegrade slowly and trap reptiles and amphibians.
- Erosion-control measures will be placed between the wetland or pond and the outer edge of the project site.
- Fiber rolls used for erosion control will be certified as free of noxious weed seed.
- Seed mixtures applied for erosion control will not contain invasive nonnative species, but will rather be composed of native species appropriate for the site or sterile nonnative species. If sterile nonnative species are used for temporary erosion control, native seed mixtures must be used in subsequent treatments to provide long-term erosion control and slow colonization by invasive nonnatives.

- Vehicles and equipment will be parked on pavement, existing roads, and previously disturbed areas.
- Trash generated by covered activities will be promptly and properly removed from the site.
- No construction or maintenance vehicles will be refueled within 200 feet of avoided wetlands and ponds unless a bermed and lined refueling area is constructed and hazardous material absorbent pads are available in the event of a spill.
- All management of pest species will be conducted in compliance with the County integrated pest management (IPM) ordinance. In addition, other requirements identified in this chapter that exceed the requirements of the IPM ordinance will be implemented.
- Where appropriate to control serious invasive plants, herbicides that have been approved by EPA for use in or adjacent to aquatic habitats may be used as long as label instructions are followed and applications avoid or minimize impacts on covered species and their habitats. In wetland environments, appropriate herbicides may be applied during the dry season to control nonnative invasive species (e.g., yellow star-thistle). Herbicide drift will be minimized by applying the herbicide as close to the target area as possible. Herbicides will only be applied by certified personnel in accordance with label instructions.
- All organic matter should be removed from nets, traps, boots, vehicle tires and all other surfaces that have come into contact with ponds, wetlands, or potentially contaminated sediments. Items should be rinsed with clean water before leaving each study site (U.S. Fish and Wildlife Service 2005).
- Implement measures to minimize the spread of disease and non-native species based on current Wildlife Agency protocols (e.g., *Revised Guidance on Site Assessments and Field Surveys for the California Red-legged Frog: Appendix B, Recommended Equipment Decontamination Procedures* [U.S. Fish and Wildlife Service 2005]) and other best available science.
- Used cleaning materials (liquids, etc.) should be disposed of safely, and if necessary, taken off site for proper disposal. Used disposable gloves should be retained for safe disposal in sealed bags (U.S. Fish and Wildlife Service 2005).
- Portions of the project that occur in streams will comply with Condition 4.

### **Condition 13. Serpentine and Associated Covered Species Avoidance and Minimization**

Serpentine soils comprise four land cover types in the study area: serpentine bunchgrass grassland, serpentine rock outcrops, serpentine seeps, and serpentine chaparral. These land cover types are estimated to encompass 14,314 acres in the study area. Additional unmapped areas of serpentine may be discovered during

implementation because it often occurs in small patches that could not be discerned at the scale of the mapping and available data.

Most of the serpentine areas in the study area are expected to be acquired as part of the Reserve System (see Chapter 5 for specific targets). However, some impacts on these land cover types may still occur (e.g., allowable impacts to serpentine bunchgrass grassland are limited to 550 acres [**Table 4-2**]). Because of the high importance and rarity of serpentine soils and their habitats, these areas will be avoided whenever feasible during project planning.

In cases where serpentine areas are part of a project site in a developed area, the project will be designed to preserve larger patches of serpentine outside the development area and limit impacts to the smallest patches feasible and to the edges of serpentine patches regardless of their size. The length of the edge of the serpentine patch that is directly adjacent to the developed area will be minimized and will include as large a buffer as possible between the serpentine edge and the developed area. Landscaping will not be planted on serpentine areas except as needed to reduce fire hazards adjacent to structures consistent with County fire hazard reduction regulations (see also Condition 10). Plantings will not include species that are known or suspected to invade serpentine habitats or cross-pollinate with endemic serpentine plant species or other native plants.

On undeveloped sites, the project area and construction staging area must be located to avoid or minimize impacts to any serpentine on site. The guidelines described above for developed areas will also be followed for project sites in undeveloped areas.

Where mapped serpentine cannot be avoided, the minimization measures listed below will be implemented.

- Conduct surveys of the serpentine vegetation to inventory for covered species and evaluate habitat quality for covered species.
- For portions of the development area that are in Bay checkerspot butterfly habitat units identified in Appendix D, survey the site for the presence of larval host plants of Bay checkerspot butterfly. If larval host plants are found, conduct reconnaissance level surveys for adult butterflies during the peak of the flight period to determine species presence or absence.
- Locate the project footprint as far from the covered species or the highest-quality serpentine habitat as is feasible. Utilize applicable buffers as identified in this chapter.
- If covered plants occur on the site and cannot be avoided, notify the Implementing Entity of the construction schedule so that plant salvage can be considered and potentially implemented (see Condition 19).

## **Condition 14. Valley Oak and Blue Oak Woodland Avoidance and Minimization**

Valley oak woodland and blue oak woodland are considered by CDFG to be sensitive biotic communities (California Department of Fish and Game 2003). There is evidence that valley oak woodland was once one of the dominant land cover types on the floor of the Santa Clara Valley, but it has been largely removed by urban and agricultural development (San Francisco Estuary Institute 2006, 2008). These communities can provide important foraging or movement habitat for species covered by the Plan—California red-legged frog, and California tiger salamander—as well as for many other native species. For these reasons, these two oak woodland land cover types would benefit from some avoidance and minimization associated with covered activities.

All covered activities will implement the following actions to avoid or minimize impacts on valley and blue oak woodland.

### **Project Planning**

- Projects on sites supporting substantial stands of valley oak woodland or blue oak woodland will minimize their impacts on these communities and preserve these stands on site when to do so would further the biological goals and objectives of the Plan. For example, projects should preserve oak woodland communities that are adjacent to existing stands of protected oak woodlands to avoid habitat fragmentation and degradation of wildlife linkages.
- Projects will avoid to the maximum extent feasible irrigating in and around valley oak woodland and will avoid altering hydrology of the site, including location of septic leach fields, such that valley oak woodland receives more water than under pre-project conditions.
- Large and healthy trees will be maintained on site whenever feasible. Local jurisdictions may set tree size thresholds for preservation that are consistent with local tree ordinances. Large valley oak trees still healthy today are clearly visible on air photos from as far back as 1939 (San Francisco Estuary Institute 2006), even though they are surrounded by agricultural fields or urban development. Preserved trees can provide habitat value for many decades; they also provide a significant community amenity.
- If trees are maintained on a site, buffer zones will be established between preserved valley oak or blue oak trees and development at a distance equal to or greater than the root protection zone, which is defined as a buffer zone determined by calculating one foot for each inch of trunk diameter measured at 4.5 feet above ground surface (Matheny and Clark 1998).

## Project Construction

- Temporary project access points will be constructed as close as possible to the work area to minimize necessity for tree removal.
- Roads and pathways will be aligned outside of the tree's root protection zone (as defined above) whenever possible.
- Roads and pathways designed beneath or within 25 feet of the dripline of oak trees will be graded using hand-held equipment and will use permeable surfacing (e.g., grass pavers that allow runoff to infiltrate the ground).
- Alteration of natural grade through fill or other means within the root protection zone of oak trees will be minimized.
- Trenching for utility lines and other purposes will be minimized within root protection zones. Utilities may be installed in these areas by boring below the root zone.
- If extensive pruning of blue oaks and valley oaks is necessary, pruning will be conducted during the winter dormant period for these species and under the supervision of an arborist certified to International Society of Arboriculture or similar standards.

## 6.6 Conditions to Minimize Impacts on Specific Covered Species

Species-specific conditions are presented below. The timing of species habitat surveys, preconstruction surveys, and construction monitoring relative to impacts are described below and summarized in **Table 6-8**. For long term projects and projects that are phased<sup>18</sup>, the frequency and timing of surveys relative to impacts will be determined by the local jurisdiction or Implementing Entity in coordination with the Wildlife Agencies on a case-by-case basis. At a minimum, surveys and monitoring (if required) will be done prior to each construction phase if the entire project area is not continuously disturbed between phases.

The Implementing Entity will maintain and update modeled habitat maps based on guidance provided in Chapter 7, *Monitoring and Adaptive Management Program*. For species that require surveys based on modeled habitat<sup>19</sup>, qualified biologists will utilize the most current modeled habitat maps available from the Implementing Entity to guide where surveys must be conducted. Surveys will be conducted based on modeled habitat maps that are updated throughout Plan implementation. Similarly, the Implementing Entity will track impacts to modeled habitat based on modeled habitat maps updated during Plan implementation.

<sup>18</sup> Phasing may include planned phasing of construction (e.g., multi-year phasing of a road construction project), or unplanned gaps in construction activity.

<sup>19</sup> San Joaquin kit fox, western burrowing owl, and Bay checkerspot butterfly.

## 6.6.1 Selected Covered Wildlife Species

Conditions 15–18 identify conditions on covered activities that are specific to some of the covered species. Activities that may affect these covered species must also adhere to other applicable conditions in this chapter, including Condition 1, *Avoid Direct Impacts on Legally Protected Plant and Wildlife Species*. A summary of species surveys, preconstruction surveys, and construction monitoring requirements is provided in **Table 6-8**.

### Condition 15. Western Burrowing Owl

To avoid or minimize direct impacts of covered activities on western burrowing owls, the procedures described below will be implemented. This condition incorporates survey, avoidance, and minimization guidelines from the following western burrowing owl conservation plans and other sources pertaining to the study area. The avoidance and minimization process for western burrowing owl as required in this condition is illustrated in **Figure 6-4**.

- *CDFG Staff Report on Burrowing Owl Mitigation* (California Department of Fish and Game 1995).
- *CDFG Staff Report on Burrowing Owl Mitigation* (California Department of Fish and Game 2012).
- *Draft Burrowing Owl Habitat Conservation Strategy and Implementation Plan* (City of San José 2000).
- *City of Morgan Hill—Citywide Burrowing Owl Habitat Mitigation Plan* (City of Morgan Hill 2003).
- Personal communication with Jack Barclay regarding ongoing monitoring efforts in the study area including annual monitoring at San José International Airport.
- Various unpublished reports from survey efforts in the study area.
- Guidance from CDFG.

### Western Burrowing Owl Habitat Survey

Western burrowing owl habitat surveys will be required in the study area in all modeled occupied nesting habitat (see **Figure 5-11**). Surveys are not required in sites that are mapped as potential burrowing owl nesting or only overwintering habitat. Modeled habitat types may change throughout the permit term based on the best available scientific data. For example, the Implementing Entity will be conducting annual surveys or collecting annual survey data of other organizations in occupied nesting habitat throughout the permit area to determine the annual status of known nesting areas the number of adult breeding owls present. The Implementing Entity will also coordinate with other South Bay local

governments, special districts, and non-profit organizations every 3 years to assess status of the burrowing owl population in the entire study area and the expanded study area for burrowing owl conservation, outside areas of modeled occupied habitat.

Habitat surveys in occupied nesting habitat are required in both breeding and non-breeding seasons. If the project site falls within occupied nesting habitat, a qualified biologist will map areas with burrows (i.e., areas of highest likelihood of burrowing owl activity) and all burrows that may be occupied (as indicated by tracks, feathers, egg shell fragments, pellets, prey remains, or excrement) on the project site. This mapping will be conducted while walking transects throughout the entire project footprint, plus all accessible areas within a 250-foot radius from the project footprint. The centerline of these transects will be no more than 50 feet apart and will vary in width to account for changes in terrain and vegetation that can preclude complete visual coverage of the area. For example, in hilly terrain with patches of tall grass, transects will be closer together, while in open areas with little vegetation they can be 50 feet apart.

This methodology is consistent with other accepted survey protocols for this species (California Burrowing Owl Consortium 1993). The Implementing Entity may update this protocol during the permit term based on changes to the accepted protocol with the concurrence of the Wildlife Agencies. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas.

If suitable habitat is identified during the habitat survey, and if the project does not fully avoid impacts to the suitable habitat, preconstruction surveys will be required. Suitable habitat is fully avoided if the project footprint does not impinge on a 250-foot buffer around the suitable burrow.

## **Preconstruction Survey**

Prior to any ground disturbance related to covered activities, a qualified biologist will conduct preconstruction surveys in all suitable habitat areas as identified during habitat surveys. The purpose of the preconstruction surveys is to document the presence or absence of burrowing owls on the project site, particularly in areas within 250 feet of construction activity.

To maximize the likelihood of detecting owls, the preconstruction survey will last a minimum of three hours. The survey will begin 1 hour before sunrise and continue until 2 hours after sunrise (3 hours total) or begin 2 hours before sunset and continue until 1 hour after sunset. Additional time may be required for large project sites. A minimum of two surveys will be conducted (if owls are detected on the first survey, a second survey is not needed). All owls observed will be counted and their location will be mapped.

Surveys will conclude no more than 2 calendar days prior to construction. Therefore, the project proponent must begin surveys no more than 4 days prior to

construction (2 days of surveying plus up to 2 days between surveys and construction). To avoid last minute changes in schedule or contracting that may occur if burrowing owls are found, the project proponent may also conduct a preliminary survey up to 14 days before construction. This preliminary survey may count as the first of the two required surveys as long as the second survey concludes no more than 2 calendar days in advance of construction.

## **Implementation of Covered Activities in Burrowing Owl Habitat**

In order to allow covered activities to go forward in burrowing owl habitat prior to the formal take authorization of individuals described above, project applicants will employ avoidance measures described below to ensure that direct take does not occur. Application of these measures is illustrated in **Figure 6-4**. The below avoidance measures apply to all projects that affect any burrowing owl habitat, regardless of whether surveys are required by this condition. In other words, if a project is occurring outside of modeled occupied nesting habitat, the project proponent is obligated to ensure avoidance and minimization of impact to burrowing owls according to the measures described below.

## **Avoidance Measures**

### **Breeding Season**

If evidence of western burrowing owls is found during the breeding season (February 1–August 31), the project proponent will avoid all nest sites that could be disturbed by project construction during the remainder of the breeding season or while the nest is occupied by adults or young (occupation includes individuals or family groups foraging on or near the site following fledging). Avoidance will include establishment of a 250-foot non-disturbance buffer zone around nests. Construction may occur outside of the 250-foot non-disturbance buffer zone. Construction may occur inside of the 250-foot non-disturbance buffer during the breeding season if:

- the nest is not disturbed, and
- the project proponent develops an avoidance, minimization, and monitoring plan that will be reviewed by the Implementing Entity and the Wildlife Agencies prior to project construction based on the following criteria.
  - The Implementing Entity and the Wildlife Agencies approves of the avoidance and minimization plan provided by the project applicant.
  - A qualified biologist monitors the owls for at least 3 days prior to construction to determine baseline nesting and foraging behavior (i.e., behavior without construction).
  - The same qualified biologist monitors the owls during construction and finds no change in owl nesting and foraging behavior in response to construction activities.

- ❑ If there is any change in owl nesting and foraging behavior as a result of construction activities, these activities will cease within the 250-foot buffer. Construction cannot resume within the 250-foot buffer until the adults and juveniles from the occupied burrows have moved out of the project site.
- ❑ If monitoring indicates that the nest is abandoned prior to the end of nesting season and the burrow is no longer in use by owls, the non-disturbance buffer zone may be removed. The biologist will excavate the burrow to prevent reoccupation after receiving approval from the Wildlife Agencies.

The Implementing Entity and the Wildlife Agencies have 21 calendar days to respond to a request from the project proponent to review the proposed construction monitoring plan. If these parties do not respond within 21 calendar days, it will be presumed that they concur with the proposal and work can commence.

### **Non-Breeding Season**

During the non-breeding season (September 1–January 31), the project proponent will establish a 250-foot non-disturbance buffer around occupied burrows as determined by a qualified biologist. Construction activities outside of this 250-foot buffer are allowed. Construction activities within the non-disturbance buffer are allowed if the following criteria are met in order to prevent owls from abandoning important overwintering sites.

- A qualified biologist monitors the owls for at least 3 days prior to construction to determine baseline foraging behavior (i.e., behavior without construction).
- The same qualified biologist monitors the owls during construction and finds no change in owl foraging behavior in response to construction activities.
- If there is any change in owl nesting and foraging behavior as a result of construction activities, these activities will cease within the 250-foot buffer.
- If the owls are gone for at least one week, the project proponent may request approval from the Implementing Entity that a qualified biologist excavate usable burrows to prevent owls from re-occupying the site. After all usable burrows are excavated, the buffer zone will be removed and construction may continue.

Monitoring must continue as described above for the non-breeding season as long as the burrow remains active.

### **Construction Monitoring**

Based on the avoidance, minimization, and monitoring plan developed (as required in the above section), during construction, the non-disturbance buffer zones will be established and maintained if applicable. A qualified biologist will

monitor the site consistent with the requirements described above to ensure that buffers are enforced and owls are not disturbed. The biological monitor will also conduct training of construction personnel on the avoidance procedures, buffer zones, and protocols in the event that a burrowing owl flies into an active construction zone.

## **Passive Relocation**

Passive relocation would not be allowed under the Plan until the positive growth trend described in Section 5.4.6 is achieved. Once this occurs, passive owl relocation may be allowed, with the approval of the Wildlife Agencies, on project sites in the non-breeding season (September 1–January 31) if the other measures described in this condition do not allow work to continue. Passive relocation would only be proposed if the burrow needed to be removed, or had the potential of collapsing (e.g., from construction activities), as a result of the covered activity.

If passive relocation is eventually allowed, a qualified biologist can passively exclude birds from their burrows during non-breeding season only by installing one-way doors in burrow entrances. These doors will be in place for 48 hours to ensure owls have left the burrow, and then the biologist will excavate the burrow to prevent reoccupation. Burrows will be excavated using hand tools. During excavation an escape route will be maintained at all times. This may include inserting an artificial structure into the burrow to avoid having the overburden collapse into the burrow and trapping owls inside. Other methods of passive relocation, based on best available science, may be approved by the Wildlife Agencies during Plan implementation.

### **Exceptions to Passive Relocation Prohibition**

Due to the relatively low numbers of burrowing owls in the study area, it is not expected that the prohibition of passive relocation will result in project delays. However, it is possible that a covered activity could not proceed due to avoidance measures for burrowing owl in this condition if owls continually persist on a site where avoidance is not feasible. In such cases, a project proponent may apply for an exception based on the following process. For this condition, the term exception means an allowance to conduct passive relocation of burrowing owls during the non-breeding season only when this activity is not otherwise allowed. This exception process is necessary to allow reasonable use and development of a property based on the variety of constraints and factors that may affect the property. In situations where exceptions are granted, other portions of this condition may still apply. Exceptions will be used in a minority of cases with special circumstances that limit or restrict the ability of a landowner to fully apply the condition.

Exceptions may be requested through the standard application process described in Section 6.8, or through a separate request process. Private applicants must apply for a passive relocation exception through their local jurisdiction. Project

proponents must develop and submit with the request for exception a passive relocation plan. The passive relocation plan must document the following.

1. That owls have occupied the site for a full year without relocating voluntarily. Surveys documenting presence must be completed by a qualified biologist and results must be provided in a written report. The report should confirm that one or more individuals (i.e., unique owl[s]) were monitored for a year and that the owl(s) had used the site for a full year<sup>20</sup>.
2. The proposed process for relocation, including schedule for the proposed passive relocation and name of the qualified biologist.

The local jurisdiction, the Implementing Entity, and the Wildlife Agencies will meet to discuss the proposed passive relocation plan. Exceptions will be considered based on, but not limited to, the following factors:

1. The parcel is equal to or less than 3 acres and is more than 1,000 feet from other suitable nesting or foraging habitat such that it is unlikely the site can sustain burrowing owls into the future.
2. If the site has historically been used for nesting (within the last 3 years).
3. If the site is a target for a burrowing owl temporary or permanent management agreement.

As part of the review process, the Implementing Entity and Wildlife Agencies will consider the implications of an exception on the burrowing owl population and progress toward the biological goals and objective of the Plan. A passive relocation exception will not be granted if the Implementing Entity and Wildlife Agencies determine that such an exception, as mitigated, would preclude implementation of the conservation strategy of the Habitat Plan or conflict with other applicable requirements of the Habitat Plan and local policies. The local jurisdiction or the Implementing Entity must make written findings that document these considerations and the rationale for the exception.

Additional mitigation may be required as part of an approval to implement passive relocation that is otherwise prohibited by the Plan. The need for and form of additional mitigation will be determined and approved by the Implementing Entity and Wildlife Agencies. Additional mitigation could include payment of additional fees, or contribution of occupied lands to the Reserve System. Applicable fees may be imposed by the local jurisdiction for processing exception requests. Mitigation will be proportional to the impact occurring as a result of a specific eviction and will fully mitigate such evictions.

The Implementing Entity will compile a list of all exceptions granted each calendar year for inclusion in the annual report to the Wildlife Agencies.

---

<sup>20</sup> If monitoring reveals that an owl(s) has vacated the site for 10 consecutive days or more, the project applicant may assume that the owl has voluntarily relocated and a qualified biologist may take measures to collapse suitable habitat to discourage new owls from occupying the site.

## Condition 16. Least Bell's Vireo

To avoid and minimize direct impacts of covered activities on least Bell's vireos, the following procedures will be implemented. These survey requirements provide compliance with the Plan and the MBTA (least Bell's vireo is a listed species, so the HCP permit also serves as a Special Purpose Permit under MBTA; see Chapter 1 for details).

### Habitat Survey

Least Bell's vireo surveys will only be required for projects occurring within potential breeding habitat. The Implementing Entity will provide maps showing the geographic regions where surveys may be required. These maps will be updated during the permit term to incorporate best available science on where this species may be found. At the time of Plan adoption, the area of required surveys is limited to the Pajaro watershed, including Uvas, Llagas, and Pacheco sub-watersheds.

Projects occurring within the mapped area require surveys if the project-specific verified land cover map (see Section 6.8.3 *Item 3: Land Cover Types on Site*) shows that the project area is within 250 feet of riparian land cover types. If a project meets this criterion, a qualified biologist will conduct a field investigation to identify and map early successional riparian vegetation (typically dominated by willow shrubs and other thick understory vegetation) which may be used for nesting. If early successional riparian vegetation is found, the project proponent may revise the proposed project to avoid all areas within a 250-foot buffer around the potential nesting habitat and surveys will be concluded.

### Preconstruction Survey

If the project proponent chooses not to avoid the potential nesting site and the 250-foot buffer, additional nesting surveys are required. Prior to any ground disturbance related to covered activities, a qualified biologist will:

1. Make his/her best effort to determine if there has been nesting at the site in the past 3 years. This includes checking the CNDDB, contacting local experts, and looking for evidence of historical nesting (i.e., old nests).
2. If no nesting in the past 3 years is evident, conduct a preconstruction survey in areas identified in the habitat survey as supporting potential least Bell's vireo nesting habitat. Surveys will be made at the appropriate times of year when nesting use is expected to occur. The surveys will document the presence or absence of nesting pairs of least Bell's vireo. Protocol-level surveys will be used (USFWS's 2001 least Bell's vireo survey guidelines or latest protocol). Surveys will conclude no more than two calendar days prior to construction.

To avoid last minute changes in schedule or contracting that may occur if an active nest is found, the project proponent may also conduct a preliminary survey up to 14 days before construction. If one or more least Bell's vireo nests are found present (through step 1 or 2 above), the nest site(s) plus a 250-foot buffer will be avoided (see below for additional avoidance and minimization details). The Wildlife Agencies will be notified immediately of nest locations.

## **Avoidance and Minimization**

Covered activities must avoid active least Bell's vireo nests during the breeding season (March 15–July 31) by maintaining at least a 250-foot no-activity buffer around all active nests. As long as the nest remains active, no activity will occur within the established buffer. Disturbance to previous nesting sites (for up to 3 years) will also be avoided during the breeding season unless the disturbance is required for the conservation strategy or to maintain public safety. Least Bell's vireos use previous nesting sites, and disturbance during the breeding season may preclude birds from using existing nests.

The required buffer may be reduced in areas where there are sufficient barriers or topographic relief to protect the nest from excessive noise or other disturbance. Implementing Entity technical staff will coordinate with the Wildlife Agencies and evaluate exceptions to the minimum no-activity buffer distance on a case-by-case basis.

## **Construction Monitoring**

If occupied nests are identified, a qualified biologist will monitor construction to ensure that the 250-foot no-activity buffer around all active least Bell's vireo nests is maintained to ensure that covered activities do not affect nest success. If monitoring indicates that construction outside of the buffer is affecting breeding, the buffer will be increased if space allows (e.g., move staging areas farther away). If space does not allow, construction will cease until the young have fledged from the nest or until the end of the breeding season, whichever occurs first. The biological monitor will also conduct training of construction personnel on the avoidance procedures, buffer zones, and protocols in the event that a least Bell's vireo flies into an active construction zone (i.e., outside the buffer zone).

## **Condition 17. Tricolored Blackbird**

To avoid direct impacts of covered activities on nesting tricolored blackbird colonies, the following procedures will be implemented.

## Habitat Survey

Projects require surveys if the project-specific verified land cover map (see Section 6.8.3 *Item 3: Land Cover Types on Site*) shows that the project area is within 250 feet of any riparian, coastal and valley freshwater marsh (perennial wetlands), or pond land cover types. If a project meets this criterion, a qualified biologist will conduct a field investigation to identify and map potential nesting substrate. Nesting substrate generally includes flooded, thorny, or spiny vegetation (e.g., cattails, bulrushes, willows, blackberries, thistles, or nettles). If potential nesting substrate is found, the project proponent may revise the proposed project to avoid all areas within a 250-foot buffer around the potential nesting habitat and surveys will be concluded.

## Preconstruction Survey

If the project proponent chooses not to avoid the potential nesting habitat and the 250-foot buffer, additional nesting surveys are required. Prior to any ground disturbance related to covered activities, a qualified biologist will:

1. Make his/her best effort to determine if there has been nesting at the site in the past 5 years. This includes checking the CNDDB, contacting local experts, and looking for evidence of historical nesting (i.e., old nests).
2. If no nesting in the past 5 years is evident, conduct a preconstruction survey in areas identified in the habitat survey as supporting potential tricolored blackbird nesting habitat. Surveys will be made at the appropriate times of year when nesting use is expected to occur. The surveys will document the presence or absence of nesting colonies of tricolored blackbird. Surveys will conclude no more than two calendar days prior to construction.

To avoid last minute changes in schedule or contracting that may occur if an active nest is found, the project proponent may also conduct a preliminary survey up to 14 days before construction. If a tricolored blackbird nesting colony is present (through step 1 or 2 above), a 250-foot buffer will be applied from the outer edge of all hydric vegetation associated with the site and the site plus buffer will be avoided (see below for additional avoidance and minimization details). The Wildlife Agencies will be notified immediately of nest locations.

## Avoidance and Minimization

Covered activities must avoid tricolored blackbird nesting habitat that is currently occupied or have been used in the past 5 years. If tricolored blackbird colonies are identified during the breeding season, covered activities will be prohibited within a 250-foot no-activity buffer zone around the outer edge of all hydric vegetation associated with the colony. This buffer may be reduced in areas with dense forest, buildings, or other habitat features between the construction activities and the active nest colony, or where there is sufficient topographic relief to protect the colony from excessive noise or visual disturbance.

Depending on site characteristics, the sensitivity of the colony, and surrounding land uses, the buffer zone may be increased. Land uses potentially affecting a colony will be observed by a qualified biologist to verify that the activity is not disrupting the colony. If it is, the buffer will be increased. Implementing Entity technical staff will coordinate with the Wildlife Agencies and evaluate exceptions to the minimum no-activity buffer distance on a case-by-case basis.

## Construction Monitoring

If construction takes place during the breeding season when an active colony is present, a qualified biologist will monitor construction to ensure that the 250-foot buffer zone is enforced. If monitoring indicates that construction outside of the buffer is affecting a breeding colony, the buffer will be increased if space allows (e.g., move staging areas farther away). If space does not allow, construction will cease until the colony abandons the site or until the end of the breeding season, whichever occurs first. The biological monitor will also conduct training of construction personnel on the avoidance procedures, buffer zones, and protocols in the event that tricolored blackbirds fly into an active construction zone (i.e., outside the buffer zone).

## Condition 18. San Joaquin Kit Fox

Disturbance of all San Joaquin kit fox dens will be avoided to the maximum extent possible. To avoid or minimize direct impacts of covered activities on San Joaquin kit fox, the following procedures will be implemented. This program was based on USFWS's *Standardized Recommendations for Protection of the Endangered San Joaquin Kit Fox prior to or during Ground Disturbance* (U.S. Fish and Wildlife Service 2011).

## Habitat Survey

San Joaquin kit fox surveys will only be required for projects occurring within modeled habitat (**Appendix D**). (This model will be updated as needed based on best available scientific information.) The Implementing Entity will provide updated modeled habitat maps to the County (the only jurisdiction in which these areas occur). A qualified biologist will conduct a field evaluation of suitable breeding or denning habitat for kit fox for all covered activities that occur within modeled habitat and map potential den sites. If the project does not fully avoid impacts on suitable dens, preconstruction surveys will be required. Suitable breeding habitat is fully avoided if the project footprint does not overlap with a suitable den or with a 250-foot buffer around the suitable den.

## Preconstruction Survey

Prior to any ground disturbance related to covered activities, a qualified biologist will conduct a preconstruction survey for covered activities in areas identified by species surveys as being suitable breeding or denning habitat. The surveys will evaluate use of dens by kit foxes using methods appropriate for the northern edge of the species' range, such as placing a tracking medium in the project area where suitable dens occur. Surveys will conclude no more than two calendar days prior to construction. To avoid last minute changes in schedule or contracting that may occur if a kit fox or active den is found, the project proponent may also conduct a preliminary survey up to 14 days before construction. On the parcel where the activity is proposed, the biologist will survey the proposed disturbance footprint and a 250-foot radius from the perimeter of the proposed footprint to identify San Joaquin kit foxes and/or suitable dens. Adjacent parcels under different land ownership will not be surveyed unless access is granted within the 250-foot radius. The status of all dens will be determined and mapped. Written results of preconstruction surveys will be submitted to USFWS and CDFG within two calendar days after survey completion and before the start of ground disturbance.

If San Joaquin kit foxes and/or suitable dens (i.e., dens greater than 5 inches in diameter) are identified in the survey area, the conditions described below will be implemented.

## Avoidance and Minimization

The goal of the avoidance and minimization measures for San Joaquin kit fox are to avoid all injury or death to kit fox in the study area, and to minimize harm or harassment to the species. No take authorization for injury or death to kit fox is provided by this Plan due to the rarity of the species in the study area. The following avoidance and minimization conditions will be applied to projects that do not fully avoid suitable dens or kit fox individuals.

- If a suitable San Joaquin kit fox den is discovered in the proposed development footprint, the den will be monitored for 3 days by a USFWS- and CDFG-approved biologist using a tracking medium or an infrared beam camera to determine if the den is currently being used.
- Unoccupied dens will be destroyed immediately to prevent subsequent use.
- If a natal or pupping den is found, USFWS and CDFG will be notified immediately. The den will not be destroyed until the pups and adults have vacated and then only after further consultation with USFWS and CDFG.
- If kit fox activity is observed at the den during the initial monitoring period, the den will be monitored for an additional 5 consecutive days from the time of the first observation to allow any resident animals to move to another den while den use is actively discouraged. For dens other than natal or pupping dens, use of the den can be discouraged by partially plugging the entrance with soil such that any resident animal can easily escape. Once the den is

determined to be unoccupied it may be excavated under the direction of the biologist. Alternatively, if the animal is still present after 5 or more consecutive days of plugging and monitoring, the den may have to be excavated by hand when, in the judgment of a biologist, it is temporarily vacant (i.e., during the animal's normal foraging activities). If at any point during excavation a kit fox is discovered inside the den, the excavation activity shall cease immediately and monitoring of the den as described above will be resumed. Destruction of the den may be completed when, in the judgment of the biologist, the animal has escaped from the partially destroyed den.

- Construction and on-going operational requirements from *Standardized Recommendations for Protection of the Endangered San Joaquin Kit Fox prior to or during Ground Disturbance* (U.S. Fish and Wildlife Service 2011) or the latest guidelines will be implemented.
- If active or suitable dens are identified within the proposed disturbance footprint or outside the proposed project footprint but within a 250-foot buffer, exclusion zones around each den entrance or cluster of entrances will be demarcated. The configuration of exclusion zones will be circular, with a radius measured outward from the den entrance(s). No covered activities will occur within the exclusion zones. Exclusion zone radii for atypical dens and suitable dens will be at least 50 feet and will be demarcated with four to five flagged stakes. Exclusion zone radii for known dens will be at least 100 feet and will be demarcated with staking and flagging that encircles each den or cluster of dens but does not prevent access to the den by the foxes.

## Construction Monitoring

If construction takes place while kit fox dens are occupied, a qualified biologist will be present to ensure compliance with the avoidance and minimization measures listed above. The frequency of monitoring will be approved by USFWS and CDFG and will be based on the frequency and intensity of construction activities and the likelihood of disturbance to the active dens. In most cases, monitoring will occur at least weekly, but in some cases daily monitoring may be appropriate to ensure that disturbance of San Joaquin kit fox is minimized.

### 6.6.2 Covered Plant Species

Impacts on covered plant occurrences are constrained by limits on the number of occurrences impacted, as described in Chapter 4 (see **Table 4-6**). Accordingly, only two additional conditions on covered activities is needed to meet regulatory requirements for covered plants.

## Condition 19. Plant Salvage when Impacts are Unavoidable

Where impacts on covered plant species cannot be avoided and plants will be removed by approved covered activities, the Implementing Entity has the option of salvaging the covered plants. Salvage of covered plants is conducted in addition to mitigation that may be required for impacts on covered plants.

Plant salvage as mitigation is acknowledged as a technique that rarely succeeds; it is opposed by conservation organizations as a primary mitigation tool (Howald 1996; California Native Plant Society 1998). Therefore, the Implementing Entity must carefully weigh the expected costs and potential benefits of the salvage effort before undertaking it. Salvage guidelines are presented below for all covered plants, for perennial species, and for annual species.

### All Covered Plants

All salvage operations will be conducted by the Implementing Entity or a third party contractor approved by the Implementing Entity. Translocation activities will be reviewed and approved by the Wildlife Agencies in advance of translocation activities occurring. Translocated plants should be moved during their dormant season in order to minimize impacts to individuals. To ensure enough time to plan salvage operations, project proponents will notify the Implementing Entity of their schedule for removing the covered plant occurrence.

The Implementing Entity may conduct investigations into the efficacy of salvaging seeds from the soil seed bank for both perennial and annual species. The soil seed bank may add to the genetic variability of the occurrence. Covered species may be separated from the soil through garden/greenhouse germination or other appropriate means. Some topsoil taken from impact sites may also be moved to the transplant site in the reserve to introduce soil microorganisms.

The Implementing Entity will transplant new occurrences such that they constitute separate populations and do not become part of an existing population of the species, as measured by the potential for genetic exchange among individuals through pollen or propagule (e.g., seed, fruit) dispersal. Transplanting or seeding *receptor* sites (i.e., habitat suitable for establishing a new population) will be carefully selected on the basis of physical, biological, and logistical considerations (Fiedler and Laven 1996); some examples of these are listed below.

- Historic range of the species.
- Soil type.
- Soil moisture.
- Topographic position, including slope and aspect.

- Site hydrology.
- Mycorrhizal associates.
- Presence or absence of typical associated plant species.
- Presence or absence of herbivores or plant competitors.
- Site accessibility for establishment, monitoring, and protection from trampling by cattle or trail users.

## **Perennial Covered Plants**

Salvage methods for perennial species will be tested for whole individuals, cuttings, and seeds. Salvage measures will include the evaluation of techniques for transplanting as well as germinating seed in garden or greenhouse and then transplanting to suitable habitat sites in the field. Techniques will be tested for each species, and appropriate methods will be identified through research and adaptive management. Where plants are transplanted or seeds distributed to the field, they will be located in reserves in suitable habitat to establish new populations. Field trials will be conducted to evaluate the efficacy of different methods and determine the best methods to establish new populations. Transplanting within the reserves will only minimally disturb existing native vegetation and soils. Supplemental watering may be provided as necessary to increase the chances of successful establishment, but must be removed following initial population establishment. Supplemental watering will include watering throughout first growing season to mimic natural rainfall patterns. During establishment, areas will be fenced off as necessary to prevent trampling or grazing by livestock. These areas will not be selected for controlled burns. Once the population has established itself, as determined by success criteria that may include setting seed, 3-year survival, or other criteria developed in agreement with the Wildlife Agencies, then fencing and irrigation will be removed and the site may be burned for management purposes if that is appropriate for the target plant.

## **Annual Covered Plants**

For annual covered plants, mature seeds will be collected from all individuals for which impacts cannot be avoided (or if the population is large, a representative sample of individuals). If storage is necessary, seed storage studies will be conducted to determine the best storage techniques for each species. A seed storage facility will also be contacted and consulted regarding collecting and storage requirements of the facility. One of the leading seed banks in California is the Rancho Santa Ana Botanic Garden in Claremont, CA (Rancho Santa Ana Botanic Garden 2010). This facility has strict seed collection and storage guidelines available on its website (<http://www.rsabg.org>).

If needed, studies will be conducted on seeds germinated and plants grown to maturity in garden or greenhouse to propagate larger numbers of seed. Such

studies can be contracted with research institutions such as the Rancho Santa Ana Botanic Garden, or carried out by other qualified biologists. Seed propagation methods will ensure that genetic variation is not substantially affected by propagation (i.e., selection for plants best adapted to cultivated conditions). Field studies will be conducted under the Adaptive Management Program to determine the efficacy and best approach for dispersal of seed into suitable habitat. Where seeds are distributed to the field, they will be located in reserves in suitable habitat to establish new populations. If seed collection methods fail (e.g., due to excessive seed predation by insects), alternative propagation techniques will be necessary.

## Condition 20. Avoid and Minimize Impacts to Covered Plant Occurrences

Almost all known occurrences of covered plants in the study area are outside the planning limits of urban growth and outside the footprint of covered activities. Many of these occurrences are expected to be included in the Reserve System. However, uncertainty remains regarding impacts on covered plants because of the lack of surveys in many areas, the general nature of some plant occurrence data, and the uncertainty in the location of some covered activities. To account for this uncertainty, impacts on covered plants are tracked by occurrence<sup>21</sup>, as described in Chapter 4. To ensure compliance with the requirements in Chapter 5, surveys for covered plants will be conducted in certain areas in order to 1) identify occurrences of covered plants, and 2) assess the condition of these occurrences.

### Covered Plant Surveys

To ensure that plants are adequately conserved relative to impacts of covered activities, plant surveys will identify occurrences of covered plants that may be affected by covered activities (see Section 5.3.1 *Land Acquisition and Restoration Actions* subheading *Incorporating Covered Plant Species*). Surveys are required in locations where covered plant occurrences are most likely to occur. Covered plant surveys will be required in the following land cover types and specific habitats. The plant species for which surveys are required are also indicated. These land cover types and habitats were identified because the majority of covered species occur primarily or exclusively in serpentine land cover types.

- Serpentine bunchgrass grassland: Survey for smooth lessingia, fragrant fritillary, Metcalf canyon jewelflower, most beautiful jewelflower, Tiburon paintbrush, and Coyote ceanothus.

---

<sup>21</sup> Occurrence can be synonymous with population for some species. However, some plant species may have several occurrences in one population. Definitions of plant populations will be developed for covered plants during implementation.

- Serpentine rock outcrop: Survey for Santa Clara Valley dudleya, smooth lessingia, Metcalf canyon jewelflower, most beautiful jewelflower, and Tiburon paintbrush.
- Serpentine seep: Survey for Mount Hamilton thistle.
- Mixed serpentine chaparral: Survey for Coyote ceanothus and most beautiful jewelflower.
- Mixed oak woodland and forest with serpentine soils: Survey for Loma Prieta hoita.
- Coast live oak forest and woodland with serpentine soils: Survey for Loma Prieta hoita.
- Northern coastal scrub and Diablan sage scrub with serpentine soils: Survey for Coyote ceanothus, Metcalf canyon jewelflower, most beautiful jewelflower, and smooth lessingia.

Plant surveys will also be required in suitable habitat within a 0.25 mile (1,320 feet) radius of a known occurrence of a covered plant to ensure that known occurrences are located (in most cases, these survey areas will overlap with the land cover types listed above). The Implementing Entity will maintain a map of known occurrences and the survey radius around each one based on this Plan and updates provided by the CNDDDB (every six months) for the study area.

These surveys will be performed according to the current applicable guidelines of CDFG and/or USFWS for plant surveys (if available) except no floristic surveys are required. The appropriate survey period for each covered plant species is described in **Table 6-9**<sup>22</sup>. Surveys must be conducted at the time of year when the species can be identified in the field. In some cases, plants may be identifiable outside of the flowering period (e.g., Mount Hamilton thistle, Coyote ceanothus).

Inside the urban service area, surveys for covered plants will occur in land cover types and habitats listed above within the area on which the land cover fee will be levied and in any other areas where indirect effects could occur. The survey area must include buffers around structure where required vegetation clearing will occur to meet state and local fuel reduction regulations.

If a covered plant occurrence is observed on site, the condition of this occurrence must be described in the application package according to the guidelines in Chapter 5, Section 5.3.1 *Land Acquisition and Restoration Activities* subheading *Incorporating Covered Plant Species*. The condition of each covered plant occurrence must be documented as a baseline to compare future monitoring (if necessary) and to ensure that occurrences are protected within the Reserve System that are in as good or better condition than those lost to covered activities.

---

<sup>22</sup> These survey periods should be used as a guide only. Some plants can be readily identified by qualified botanists outside of the species' blooming period.

If a covered plant occurrence is found on the project site, the local jurisdiction will obtain the opinion of a qualified biologist regarding the projected long-term viability of a covered plant occurrence given the plant occurrence condition, site conditions, and project-level construction details. The qualified biologist will make this determination based on best available scientific information. In cases where it is difficult to project long-term viability, the qualified biologist will conservatively error in favor of the covered plant and assume that long-term viability will be reduced and the occurrence will be considered lost for tracking purposes. Impacts to covered plants will be avoided or minimized wherever possible by implementing the following conditions.

## **Avoidance and Minimization**

In order to reduce impacts to covered plants, all covered activities will be confined to the minimum area necessary to complete the activity or construction. A setback buffer will be established around covered plant occurrences located on any project site or in an adjacent area that could be affected by construction traffic or activities. The setback buffer will be adequate to prevent or minimize impacts during or after project implementation. The plants and buffer area will be protected from encroachment and damage during construction by installing temporary construction fencing. Fencing will be bright-colored and highly visible. Fencing will be designed to keep construction equipment away from plants and prevent unnecessary damage to or loss of plants on the project site. Fencing will be installed under the supervision of a qualified biologist to ensure proper location and prevent damage to plants during installation. Fencing will be installed before any site preparation or construction work begins and will remain in place for the duration of construction. Construction personnel will be prohibited from entering these areas (the exclusion zone) for the duration of project construction.

## **Site Monitoring, Assessment, and Management**

If a qualified biologist determines that the long-term viability of a covered plant occurrence will be reduced (as described below) by implementation of covered activities, the loss must be offset by protection, management, and monitoring of covered plant occurrences in the Reserve System prior to impacts (**Table 5-16**).

Some covered plant occurrences may only be disturbed or partially affected by covered activities, and viability may be maintained. It is important to monitor and, if possible, maintain these occurrences of covered plants where they occur, even if they are not protected within the Reserve System. Covered plant occurrences that are determined to be partially permanently affected by a qualified biologist (i.e., only a portion of the occurrence is impacted) by covered activities will be monitored by the Implementing Entity. The purpose of the monitoring will be 1) to assess whether the impact reduces the long-term viability of the occurrence and whether supplemental management actions are feasible and warranted, and 2) to determine whether the Implementing Entity must protect and

enhance or create<sup>23</sup> occurrences in the Reserve System according to **Table 5-16**. If the impact occurs to less than 5% of the total occurrence as measured by the number of individuals at the time of impact, then the impact is assumed not to affect long-term viability and will not require monitoring nor will it count as a permanent impact (**Table 4-6**). This allowance does not apply to Coyote ceanothus.

When determining viability for the purpose of assessing a partial or permanent impact, the Implementing Entity will consider the following factors.

1. Results of monitoring plant occurrences affected by covered activities (e.g., correlation between pre-project observations and actual viability post-project).
2. Impacts to date to the covered plant species and how close total impacts are to the allowable impact cap in the Plan (e.g., extra care taken when near cap not to exceed the cap).

Specific monitoring protocols and success criteria will be developed during implementation as appropriate for each covered species, according to the guidelines discussed here. Monitoring protocols can draw on those developed for other HCP/NCCPs. It is possible that only a portion of the occurrence will be located on the covered activity project site. In such instances, the monitoring protocol will address this issue. Three possible approaches include the following.

1. If the landowner agrees, the Implementing Entity will obtain access to the adjacent sites on which the rest of the plant occurrence is located, and surveys will include the entire occurrence.
2. If access to adjacent site(s) is not possible, or if for some other reason it is not feasible to survey the entire occurrence, then an alternative will be developed to estimate the extent and condition of the adjacent portion of the occurrence.
3. If only a small portion of the occurrence is on adjacent properties, then only the portion of the occurrence on the project site will be monitored and assessed for viability. The determination whether this is a full impact will be made based on the results for this portion of the occurrence only.

Population monitoring will be conducted by the Implementing Entity before the covered activity is implemented to document the baseline condition. For annual species, the minimum post-construction monitoring period will be 5 years. If extreme or unusual climate conditions affect the species, then monitoring will be extended 1 or 2 years, as appropriate to assess impacts and success. Monitoring will include estimates of percent cover and number of individuals. An occurrence will be assumed to retain long-term viability and will not require replacement in the Reserve System if the decline in occurrence size and percent cover from pre-project conditions is less than 25% over the monitoring period,

---

<sup>23</sup> Creation is only allowed to mitigate effects for Coyote ceanothus. All other plant occurrence creation would contribute to recovery (**Table 5-16**).

unless site-specific conditions otherwise suggest substantial declines in occurrence viability.

For perennial species, the minimum post-construction monitoring period will be 3 years. Monitoring will include estimates of density (percent cover), recruitment of seedlings if impacts included removing individuals, and measurements of adult plant health (e.g., signs of disease, herbivory, nutrient deficiencies, etc.). An occurrence of a perennial covered species will be assumed to retain long-term viability and will not require replacement in the reserve system if the decline in seedling recruitment and density from pre-project conditions is less than 25% over the monitoring period, unless site-specific conditions otherwise suggest substantial declines in occurrence viability.

The Implementing Entity will implement conservation actions on the site that would help to maintain or improve the condition of the occurrence, as long as an agreement can be reached with the landowner to conduct these measures. Possible conservation measures are described in Chapter 5. If plant occurrences are determined to not be viable based on post-project monitoring, the Implementing Entity must assess the loss as a full permanent impact and implement conservation actions accordingly. In these cases, mitigation would occur after the impact. However, the potential for mitigation to occur after impacts is unlikely given that the qualified biologist and Implementing Entity will make conservative determinations regarding projected impacts on long-term viability.

## **6.7 Receiving Take Authorization under the Plan**

Take authorization will be provided by the Plan to three broad categories of covered activities: public projects proposed by the Permittees, private projects under the jurisdiction of the Permittees, and public projects by non-Permittees in the study area that are approved for inclusion by the Implementing Entity. Each of these situations is explained below.

### **6.7.1 Evaluation Process for Permittee Projects**

The Plan permits provide the Permittees with take authorization along with the authority to approve covered activities complying with the terms of the Plan. If a Permittee undertakes a covered activity (see Chapter 2), the Permittee must document compliance with the Habitat Plan and provide a copy of this documentation to the Implementing Entity for tracking purposes (i.e., to track the amount of take coverage granted) before the Permittee take authorization may be used. As described in Chapter 8, the Permittees will develop a template Habitat Plan application package for use by private applicants and Permittees that includes all items described in this section prior to permit issuance. It is expected that the documentation will be similar to the *Habitat Plan application package*

required of private project proponents<sup>24</sup> applying to local jurisdictions for coverage (this application package is described in detail in Section 6.8 *Habitat Plan Application Package*, below).

## Review and CEQA for Permittee Projects

Many covered activities are expected to be subject to CEQA<sup>25</sup>. When Permittees initiate projects that are also subject to CEQA, the terms of the Habitat Plan should generally be integrated into the CEQA environmental review process. To facilitate CEQA coordination, the Permittee should begin preparation of the Habitat Plan application package (or equivalent material) when the CEQA project description and alternatives for the project are developed such that requirements of the Habitat Plan can be used to inform site design and selection of the preferred alternative. The completed Habitat Plan documentation should be evaluated and approved by the appropriate CEQA lead agency of the Permittee concurrently with the lead agency's review of the associated CEQA documents. Projects exempt from CEQA may still be covered activities under this Plan and require compliance with the conditions of this Plan as described in this chapter.

## Receiving Take Authorization for Permittee Projects

Incidental take associated with covered activities carried out by the Permittees is authorized under the permits issued for the Habitat Plan. These projects are therefore “pre-approved” for take authorization by the Wildlife Agencies as long as their effects were adequately analyzed, they meet the conditions of the Plan, and they pay the appropriate fees, if applicable. Each Permittee is responsible for ensuring that its covered activity is compliant with the conditions of approval described in this chapter. Take authorization will be in effect once the Permittee documents consistency with the Habitat Plan. The form developed by the Implementing Entity to document the consistency of private development with the Plan may also be used by Permittees for their own projects. Documentation of Plan consistency and a complete Habitat Plan application package must be submitted to the Implementing Entity for tracking purposes. The process for receiving take authorization under the Plan for public projects of the Permittees is shown in **Figure 6-5**.

---

<sup>24</sup> The term *project proponent* is used interchangeably with the term *applicant* or *project applicant* in this and subsequent chapters.

<sup>25</sup> Permittee covered activities that may not be subject to CEQA include operations and maintenance activities and projects that only require ministerial approval within local jurisdictions such as single family home construction.

## 6.7.2 Application Process for Private Projects

Private applicants seeking coverage under the Habitat Plan, including applicants that wish to opt in to the Plan<sup>26</sup>, will apply to their local jurisdiction by submitting a *Habitat Plan application package* described in Section 6.8 *Habitat Plan Application Package*. A checklist for evaluating these applications will be developed by the Implementing Entity prior to the first ordinance implementing the Plan taking effect. The local jurisdiction will review the Habitat Plan application package for completeness in accordance with the checklist. For requests to opt in, the local jurisdiction will also evaluate the amount of take requested (i.e., acres of impacts) and whether or not take coverage is available for the project. If the application package is not complete, it will be returned to the project proponent with an explanation of why it is incomplete. If the application package is complete, the local jurisdiction will calculate the required fees on the basis of the requirements described in Chapter 9 and consistent with the local ordinance implementing the Plan. The determination of completeness of the application package rests with the local jurisdiction. If they choose, local jurisdictions may request technical assistance from the Implementing Entity staff in their review.

All applicable conditions will be identified and fees paid at (or before) the time of issuance of the first authorization of ground disturbance (typically a grading permit or building permit). In cases where there is no grading or other ground disturbance permit, the fees will be due upon issuance of the first permit that authorizes construction. If the project proponent requests to contribute land in lieu of fees or requests special project conditions, such requests must be reviewed and approved by the Implementing Entity. See Chapter 8, Section 8.2.1 *Permittees* for Permittees that may grant take authorization and Section 8.7 *Roles and responsibilities in Reviewing Applications for Take Authorization* for additional detail on application review.

The process for receiving take authorization for private projects is shown in **Figure 6-6**. Local agencies reviewing the Plan application package will be subject to the processing time and other requirements of the Permit Streamlining Act (Section 65920 et seq.) which requires public agencies to follow standardized time limits and procedures when making specific types of land use decisions.

## Application Review and CEQA for Private Projects

Many private covered activities will require a land use approval and be subject to CEQA. For such covered activities, review of applications for take authorization should generally be undertaken concurrently with the CEQA environmental review. To facilitate this approach, the local jurisdiction should generally request

---

<sup>26</sup> Private parties that are not subject to the Plan (see **Figure 2-5**) have the option to request coverage under the Plan from the applicable local jurisdiction.

that project proponents submit initial Habitat Plan application package information as part of the land use approval application and CEQA process.

There are many benefits to drafting the Habitat Plan application early in the planning process. First, submitting initial Plan application package information during the land use approval / CEQA process will illustrate the various requirements of the Habitat Plan on the proposed project, and provide time for the project proponent to change the project description or to identify alternatives for CEQA analysis. Second, it will enable the CEQA document to refer to the project-specific requirements as identified in the draft Plan application. Finally, it will enable the local jurisdiction to provide early review of the Plan application for completeness. Based on a review of this initial information and a determination of the Habitat Plan requirements, the local jurisdiction can establish conditions of approval specifying the Habitat Plan conditions and fee requirements. Habitat Plan fees will need to be paid prior to the issuance of construction permits (grading / building permits).

Each local jurisdiction is responsible for ensuring that covered activities, upon issuance of take, fully comply with the terms of the Habitat Plan.

## **Granting Take Authorization for Private Projects**

Proponents of private projects that are covered by the Plan and not exempt (see Section 6.2 *Exemptions from Conditions*) must have their projects conditioned by the local jurisdiction obligating compliance with all terms and conditions of the Implementing Agreement, the Plan, and the state and federal permits that apply to the project prior to the local jurisdiction issuing take authorization. Such terms and conditions include, but are not limited to, those listed below.

- Compliance with all relevant avoidance, minimization, surveys, monitoring, and conservation measures determined by the local jurisdiction to apply to the project as required by the Plan.
- The right for the Permittee to monitor the applicant's compliance with all applicable conditions of this Plan.
- Imposition of a fee or dedication of land in lieu of the fee as described in Chapter 9 and in the local Implementing Ordinance.

Before take authorization is granted, Permittees must prepare a written determination of the project's consistency with the Plan. A template form for private applicants that documents this determination of consistency will be developed by the Implementing Entity prior to the first local ordinance taking effect (this consistency determination will be made based on the application checklist described above).

Once the Habitat Plan application package is deemed complete, the conditions of approval have been established and imposed, and the required fees (if applicable) have been paid, the project proponent will be granted take authorization by the

appropriate Permittee (see Chapter 9 for required fees and payment times). At this point, the project proponent will be allowed to proceed with the project consistent with other applicable local, state, and federal laws and local entitlements. Take authorization for impacts on covered species will be provided by the applicable Permittee consistent with the state and federal permits issued to all Permittees. Each local jurisdiction, working with the Implementing Entity will develop a process to document projects that receive take authorization but do not proceed with the project to have the take authorization removed from the Implementing Entity's records.

When Habitat Plan application packages are completed, each Permittee must provide a copy of the application material to the Implementing Entity for entry into the Habitat Plan database (described in Chapter 8 *Plan Implementation*).

### 6.7.3 Application Process for Non-Permittee Public Projects

Because the list and evaluation of covered activities in Chapter 2 is meant to be comprehensive, the Plan has included some projects that will be proposed by public entities that are not Permittees. For example, a special district or local school district may propose to build a project in one of the three participating cities or the unincorporated County. Although the special district or school district is not subject to the land use jurisdiction of the participating jurisdictions, the impacts of its project have been covered by the Plan and evaluated as part of the planned urban development within the jurisdiction. To receive coverage under the Plan, projects proposed by an entity that is neither a Permittee nor subject to the land use authority of a Permittee, the project proponent must apply directly to the Implementing Entity as a *Participating Special Entity*. The entity will provide the same Habitat Plan application package as private entities seeking coverage. See Chapter 8, Section 8.4 *Participating Special Entities*, for more details on the process by which Participating Special Entities receive take authorization under the Plan.

## 6.8 Habitat Plan Application Package

Private projects that are covered by the Plan must submit a *Habitat Plan application package* to the local jurisdiction for review and approval in order to receive coverage under the Habitat Plan. For their own projects, Permittees must submit an application package to the Implementing Entity for tracking purposes and pay the appropriate fees if applicable. The project proponent is responsible for preparing the application package and paying for any necessary field surveys, if required. The application package must contain the following items, if applicable, each of which is described in detail in this section.

- Item 1: An application form for coverage under the Plan.

- Item 2: A brief description and map of the project.
- Item 3: Documentation of land cover types on site.
- Item 4: Map of wetlands and waters, if applicable.
- Item 5: Results of applicable surveys for selected covered species.
- Item 6: Documentation of any additional and applicable avoidance and minimization requirements that will be implemented.

Each item in the application package builds on the previous item. For example, surveys for certain covered wildlife and plants (Item 5) are required only if specific land cover types are documented on the site (Items 3 and 4). Many covered activities will be able to comply with the Habitat Plan by only completing Items 1, 2, and 3 of the application package. For others, field surveys are limited to only the highest-value biological resources.

Most components of the application package can be prepared by the applicant, with the assistance of local planning staff. In some cases, the Plan requires that components be prepared or surveys or monitoring be conducted by *qualified biologist*. Please see *Qualified Biologists* below for details on the qualification process.

Templates for all these application components will be provided by the Implementing Entity to each local jurisdiction prior to the first local ordinance taking effect. These templates will also be posted on the Habitat Plan web site for use by private applicants and their consultants. Use of the templates will streamline the review and approval process by local jurisdictions. The Permittees may adjust the required components of the application package over time, consistent with the requirements of the Plan. To recover the costs of reviewing and processing these application packages, local jurisdictions may charge a fee associated with the application (see Chapter 9 for details).

The Habitat Plan application package, survey requirements, and conditions of approval were designed with the following principles in mind.

- Provide the necessary data to track impacts of all covered activities to allow the Implementing Entity to meet Plan requirements (e.g., land acquisition, Stay-Ahead provisions, wetland restoration).
- Simplify and reduce pre-project survey requirements relative to current and future environmental regulations throughout the Habitat Plan.
- Avoid and minimize impacts on covered species and natural land cover types to the maximum extent practicable on a regional scale, in compliance with federal and state endangered species laws.
- Ensure that survey requirements are proportional to impacts—the survey burden is lower on low-quality habitat than on high-quality habitat.
- When possible, limit survey requirements under the Plan to those required for other local, state, or federal environmental compliance (e.g., CEQA or

NEPA), and redirect resources previously spent on biological surveys to improve regional conservation.

Each of the required application components is described below.

### **6.8.1 Item 1: Project Application Form**

The project application form will contain basic information about the project. The Implementing Entity will develop a form prior to issuance of the state and federal Plan permits that will be made available to the Permittees. Required forms will be available through the local jurisdictions and on the Habitat Plan website.

### **6.8.2 Item 2: Project Description and Map**

The application package will include a brief project description including the location, assessor's parcel number, construction activity or maintenance methods, a description of the nature of the impacts (permanent or temporary), and timing (including duration) of the project or activity. The project description will be sufficient to document that it is a covered activity in the Plan (see Chapter 2). A legible vicinity map of the project site will also be provided to document that the project is within the Habitat Plan study area. A vicinity map will include any streams or water bodies that fall within the mapped area. If the project is located in Fee Zone A or B, but the project applicant believes that the project qualifies for Fee Zone C, the project applicant must demonstrate compliance with the criteria provided in Chapter 9, Section 9.4.1 *Habitat Plan Development Fees*, subheading *Land Cover Fee Zones*. A project detail map will be included that shows the area on which fees will be levied, as well as the full project parcel if inside the urban service area or the full development area if outside the urban service area, and any relevant landforms, roads, water bodies, and existing and proposed structures that will be affected by the proposed project.

### **6.8.3 Item 3: Land Cover Types on Site**

As described in Chapter 3 *Physical and Biological Resources* a detailed land cover map was developed for the study area for this Plan. This land cover map was essential in estimating impacts of the covered activities (Chapter 4) and developing the conservation strategy (Chapter 5). However, due to limitations in the land cover mapping (see **Table 3-4**) and the potential for land cover to change over time, land cover types must be verified at the time applications are submitted. This step is also critical because almost all impacts under the Plan are tracked by land cover type.

Proponents of all projects and activities with quantifiable impacts, including approved Participating Special Entities, will specify the amount and type of land cover that will be permanently and temporarily impacted. All fees are paid on the development area (see **Figure 6-1**) except for land inside the urban service area designated with a land use of Urban Development or Rural Residential (see **Figure 2-2**) that is less than 10 acres, where fees are assessed on the parcel. In addition, all public corridor projects (e.g., stream and utility) pay fees based on the project footprint, regardless of parcel size. As described in Condition 12, projects that do not completely avoid indirect effects to wetlands (including wetlands on parcels adjacent to the covered activity development area) will be considered permanently impacted and will count towards the impact caps described in **Table 4-2** and will be assessed fees as described in Chapter 9.

Project proponents of activities that have temporary impacts are required to provide photographs that document the condition of the project site before the activity is implemented. These photographs will be compared to those required for post-project conditions (see Item 6) to determine if impacts were temporary and that appropriate fees were paid.

All calculations and other information provided in application packages will be verified by the local jurisdiction or Implementing Entity so that all impacts to land cover types can be tracked appropriately and fees paid. This exercise can be performed through air-photo analysis or field verification. Project proponents may request assistance from local planning staff in this analysis (for exempt projects, local jurisdictions will document land cover types present). For sites outside urban or suburban areas that support natural land cover types, land cover verification may need to be performed by a qualified biologist. Land cover type classification will be done in accordance with the descriptions provided in Section 3.3.5 *Natural Communities and Land Cover Types*. If the project site supports or may support any wetland or stream land cover types that would be affected by the proposed project, a qualified biologist must be retained (see Item 4 below).

All land cover determinations provided by private applicants will be verified by local planning staff. All land cover determinations provided by a Permittee will be verified by Implementing Entity staff. A private applicant or Permittee may retain Implementing Entity staff (at cost) to conduct this land cover mapping. Local jurisdiction staff may also be available to provide this service to private applicants as part of the application review process.

Land cover mapping of sites with the following land cover types, as mapped by the Plan, can be conducted by the applicant or local planning staff.

- California annual grassland<sup>27</sup>;
- reservoirs;

---

<sup>27</sup> See definition of annual grassland in Chapter 3. When trees are present in annual grassland at low density, the land cover may instead be oak woodland. In these cases, a qualified professional is needed to make the determination.

- all agricultural land cover types; and
- all development land cover types.

Additions to existing development encompassing an area of 10,000 square feet (approximately 0.2 acre) or less on any land cover type, other than stream, riparian, serpentine, pond, or wetland land cover types, do not require land cover mapping by a qualified biologist or other professional. These projects may be mapped based on aerial photos by planners or applicants.

All other land cover types must be mapped by a qualified biologist. Forest land cover types can also be mapped by a professional forester or arborist. Accurate mapping of the remaining land cover types is necessary because of the Implementing Entity's obligation to stay ahead of impacts by land cover type and to ensure the appropriate species surveys are conducted. The Implementing Entity will provide a list of qualified biologists to conduct land cover mapping and other surveys required by the Habitat Plan. The Implementing Entity may also provide a list of qualified professionals (e.g., non-biologists such as foresters and arborists) to conduct land cover mapping. Biologists and other professionals qualified to conduct land cover mapping will have demonstrated experience conducting vegetation mapping in the field or from air photos at the scale of the proposed project and in vegetation types similar to those on the project site. This list will be updated regularly and made available to project proponents and the Permittees. Biologists conducting species surveys that could result in take must also be pre-approved by USFWS and CDFG (see Item 5 below).

Land cover mapping is not required for operations and maintenance activities conducted by Permittees except where serpentine land cover will be impacted (land cover mapping is required for all private applicants and Participating Special Entity projects). However, Permittees must still implement all applicable conditions including plant surveys. As such, some projects with operations and maintenance covered activities may require land cover mapping to determine applicable conditions. If no land cover mapping is conducted, Permittees will rely on the most recent land cover map developed by the Implementing Entity to quantify impacts.

For covered activities that result in temporary impacts, in lieu of aerial photo or field-verified land cover mapping, applicants have the option of assuming that the entire footprint of the covered activity permanently affects natural land cover types based on the Plan's most recent land cover map (and therefore pays a fee on these impacts as described in Chapter 9). This option is available for temporary impacts because the footprint of many of these activities is expected to be relatively small. If the land cover types assumed to be permanently impacted include those land cover types that trigger covered species surveys, then covered species surveys must be conducted.

The application package must include a map showing all land cover types on the project parcel(s) if the project is located inside the urban service area or within the development area if the project is outside the urban service area, and a table showing the amount of each land cover type to the nearest 0.1 acre for all non-

stream land covers or linear foot for streams (blank tables will be provided in the template application package). These final values will be used to calculate any required fees (Chapter 9).

**Table 6-8** describes land cover types and habitat elements that, when present, trigger the need for preconstruction surveys for five covered wildlife species. For example, if a project is located within occupied nesting habitat modeled for burrowing owls, a qualified biologist would need to conduct a habitat survey and possibly a pre-construction survey to map any burrows within 250 feet of the activity footprint. In some cases, presence of the habitat feature itself, regardless of land cover, may trigger additional survey requirements (**Table 6-8**).

The presence of certain land cover types on site may also trigger the need to survey for specific covered plants, as described in Item 5 below.

## 6.8.4 Item 4: Map of Wetlands, Ponds, Streams, and Riparian Woodlands

A map of all coastal and valley freshwater marsh, seasonal wetlands, ponds, riparian woodland, and streams is required for any project subject to the Habitat Plan that may directly or indirectly affect these aquatic land cover types.

Although Section 404 Clean Water Act wetland delineations are a tool that can be employed, jurisdictional delineations completed to meet the requirements of Section 404 do not necessarily account for all aquatic habitat for species proposed for coverage under this Plan (e.g., they do not address waters of the state that are not also waters of the U.S.). The Implementing Entity will use the wetland and waters map<sup>28</sup> developed for Item 4 of the application package to track impacts to coastal and valley freshwater marsh, seasonal wetlands, ponds, riparian woodland, and streams and to determine the wetland fee owed (see Chapter 9, Section 9.4.1, subheading *Wetland Mitigation Fee* and **Table 9-6**). Fees on wetlands, ponds, and riparian woodland will be determined by the acres of impact (see Condition 12 above and Chapter 9). Stream fees and impacts will be determined by the linear feet of stream affected, measured at the stream centerline.

Project proponents will not need to provide Item 4 of the application package if the Implementing Entity or permitting local jurisdiction determines that aquatic features will not be directly or indirectly affected by covered activities.

Formal delineations are typically required to identify waters of the U.S. and support compliance with Section 404 of the Clean Water Act. Maps of non-jurisdictional aquatic features are typically required to identify waters of the state

---

<sup>28</sup> Although delineations can be conducted any time of the year, they will be based on an evaluation of multiple factors by a qualified biologist, including but not limited to, hydrology, vegetation, and soils. Wetland features do not need to be holding water at the time of the field investigation to be delineated.

and support compliance with the Porter-Cologne Water Quality Control Act and Section 1602 of the California Fish and Game Code.

Project proponents are encouraged to produce maps for Item 4 that support other necessary state or federal permitting needs, but maps do not need to be verified by the Corps or Regional Boards prior to submission of the application package. If the Habitat Plan application will also meet the application requirements of the Habitat Plan RGP, once such a permit is in place, the delineation method must be consistent with Corps's delineation protocol. Such delineations may be verified by the Corps prior to application submittal, or delineations may be verified by the Corps as part of application processing once the application is submitted.

If a process for permitting projects affecting waters of the U.S. and/or waters of the state is not provided by local jurisdictions or the Implementing Entity in conjunction with the Plan, proponents of projects that could affect such resources must seek such permits on their own. In such cases, this Plan does provide the framework for CESA and ESA compliance for covered activities that would result in impacts on state or federal wetlands and waters.

## 6.8.5 Item 5: Results of Applicable Species Surveys and Monitoring

As described in Item 3, the presence of certain land cover types on the project site triggers an evaluation of whether specific habitat elements for selected wildlife species or for occurrences of covered plants. **Figure 6-7** summarizes these triggers and survey process. Survey requirements for these selected wildlife species are based on avoiding take of individual species—particularly animals with lower reproductive outputs (e.g., western burrowing owl) than other species (e.g., fish and amphibians). If suitable breeding habitat of these selected wildlife species is found, preconstruction surveys are triggered (see Conditions 15–18). If the preconstruction survey identifies occupied breeding habitat, project proponents must implement defined avoidance and minimization measures to avoid the resource during breeding seasons. Compliance during construction will be monitored by a qualified biologist.

As described below in this section under *Surveys for Covered Plants*, covered plant surveys will be required for specified land cover types. If an occurrence of a covered plant is present on the site, additional field assessment is required to document the occurrence's condition.

The purpose of these surveys is to comply with the avoidance and minimization requirements of ESA and CESA. If surveys are planned far enough in advance (typically 6–8 months), it is expected that in most cases identification of selected occupied habitat will not change the project design or schedule. These survey requirements and avoidance measures are designed to avoid or minimize take of individuals (as required by law), to document key resources for tracking

purposes, and to ensure that impacts on plant occurrences are properly mitigated by the Implementing Entity.

Although surveys are required in specific cases, overall, impacts on covered species are assumed to occur on all project sites. However, if the results of the preconstruction survey documents a large or important population of a covered species other than those acknowledged in the Plan, the local agency reviewing or proposing the project must consult the Implementing Entity for advice on species avoidance and minimization measures<sup>29</sup>. The Implementing Entity will also contact the Wildlife Agencies for technical advice. Protocol-level surveys to document species presence or absence are not required for the Habitat Plan, with the exception of the least Bell's vireo (Condition 16).

Species surveys are required for all covered activities, including some operations and maintenance activities, subject to the conditions on covered activities except as noted in the following section. Species survey requirements and exemptions are described in greater detail below.

## Exemptions from Species Surveys, Preconstruction Surveys, and Construction Monitoring

The following types of covered activities are exempt from species survey and construction monitoring requirements for target covered wildlife species and covered plants. A summary of the types of exemptions available is described in **Table 6-1**. Activities exempt from species surveys must still submit an application package as described above.

- Covered operations or maintenance activities, including those on the Reserve System, that do not result in any ground disturbance or removal of natural land cover types not identified in the following exemptions.
- Covered operations or maintenance activities that occur more than once annually within the same location, as long as applicable surveys are conducted once before initiating the activity in the appropriate season (i.e., wildlife and plant surveys must be conducted during the appropriate time of year) and there are negative survey results. Such activities are likely to result in repeated disturbance that will preclude establishment or persistence of the covered species targeted by these surveys. If species surveys identify wildlife covered species, preconstruction surveys and construction monitoring must be conducted according to the conditions in this chapter. Unavoidable impacts to covered plant species will be tracked toward the Plan's impact limits (**Table 5-16**). All applicable wildlife and plant surveys must be conducted prior to implementation of the covered operations or maintenance activity until the covered species has not been detected at the site for three consecutive years. Applicable surveys will once again be

<sup>29</sup> If new information is found through surveys or other data that greatly changes the understanding of covered species distribution or habitat requirements from that described in this Plan, the Plan would need to be re-evaluated and an amendment may be necessary (see Chapter 10 for the amendment process).

required if operations and maintenance activities cease for three or more consecutive years.

- Covered activities that occur entirely on one or more of the following land cover types<sup>30</sup>.
  - ❑ Coyote brush scrub.
  - ❑ Reservoir.
  - ❑ Stream (i.e., riverine) where no riparian or wetland vegetation occurs.
  - ❑ Agricultural developed<sup>31</sup>.
  - ❑ Urban-suburban.
  - ❑ Rural-residential.
  - ❑ Ornamental woodland.

In addition to the exemptions listed above, covered activities occurring on the land cover types listed below, while subject to the wildlife species surveys, preconstruction surveys, and construction monitoring requirements, will not trigger any covered plant surveys<sup>32</sup>.

- Willow riparian forest and scrub.
- Redwood forest.
- Coastal and valley freshwater marsh.
- Pond.
- Orchard.
- Vineyard.
- Grain, row crop, hay and pasture, disked/short-term fallowed.
- Golf courses/urban parks.
- Barren.

## Qualified Biologists

Several types of monitoring will be conducted for this Plan including species surveys, preconstruction surveys, construction monitoring, and effectiveness monitoring conducted on the Reserve System. This requirement applies to all monitoring described in this Plan including conditions on covered activities described in this chapter and effectiveness monitoring described in Chapter 7.

---

<sup>30</sup> These land cover types do not support any of the covered species for which surveys are required.

<sup>31</sup> The land cover type “agriculture developed” (also known as agriculture developed/covered ag) is defined in Chapter 3 as intensive agricultural operations such as nurseries and greenhouses.

<sup>32</sup> Focused surveys for selected covered wildlife may still be required; consult **Table 6-8** and Conditions 13 and 15–18.

*Qualified biologists* are those biologists who have the experience, education, and training necessary to perform the tasks described in this Plan accurately and in an unbiased fashion. The term “qualified biologist” is used generically to mean a biologist who is trained to perform the given task; such a person is, more specifically, a fisheries biologist, wildlife biologist, or botanist. Training must be in the field to which the task is related. For example, a wildlife biologist may not perform a covered plant survey or delineate land covers for a project application unless the individual is also competent in those fields.

If the task does not have the potential to result in take of covered species (e.g., land cover mapping, establishing perimeters around an active nest or burrows, or monitoring the compliance of construction crews), applicants (or Permittees) may choose their own biologists to conduct these specialized tasks. Applicants will provide the local jurisdiction with a brief resume of the biologist so that the local jurisdiction (or in the case of a Permittee project, the Implementing Entity) can verify the qualifications of the biologist. The local jurisdictions will review these qualifications with the application package. If the local jurisdiction finds the qualifications lacking, they may ask the applicant for additional information or for another survey by a more qualified biologist.

If the task has the potential to result in take of covered species (e.g., discouraging use of a den by a San Joaquin kit fox, handling a California tiger salamander, or conducting effectiveness monitoring described in Chapter 7), the biologist must be approved by the Implementing Entity and Wildlife Agencies prior to conducting such tasks. Biologists conducting this work may be Implementing Entity staff or consultants hired by the Implementing Entity.

To be approved, these biologists must provide the Implementing Entity with credentials demonstrating that he or she has an understanding of the monitoring protocols, data collection techniques, and handling procedures for the covered species. If the Implementing Entity deems the biologist qualified, then the Implementing Entity will forward the recommendation to the Wildlife Agencies for approval. The names, contact information, and written certification of training and qualifications for these biologists will be provided to the appropriate Wildlife Agencies for approval. This documentation will also be on file with the Implementing Entity.

Upon Implementing Entity and Wildlife Agency approval, the Implementing Entity will maintain a list of *pre-approved* qualified biologists who may conduct monitoring work for a 5-year period. This approval process will reduce the need for 2081(a) and/or 10(a)(1)(b) permits as well as the need for the Wildlife Agencies to review qualifications on a case-by-case basis during implementation.

Individuals who are not pre-approved by the Implementing Entity and Wildlife Agencies to conduct monitoring with the potential for take may conduct monitoring if they have a valid recovery permit for the species that they are monitoring. In either case, the biologist will possess all of the qualifications that would otherwise be required under a recovery permit.

## Surveys for Breeding Habitat of Select Covered Wildlife Species

While take of covered species and impacts to their known and suitable habitat is assumed and mitigated under the regional approach to mitigation and conservation described above, avoidance of breeding habitat for selected covered wildlife species is required. The selected species have the greatest potential to benefit from avoidance measures and are generally species with lower reproductive rates, such as birds and mammals, which suffer greater consequences from take of individuals, particularly when breeding. Survey requirements for these species are triggered by the presence of specific land cover types and habitat features as described in **Table 6-8**. These species and their habitat features are listed below.

- Western burrowing owl (occupied and nesting habitat, see **Figure 5-11**).
- Least Bell's vireo (breeding habitat in South County<sup>33</sup>, see species habitat distribution model in **Appendix D**).
- Tricolored blackbird (breeding habitat, see species habitat distribution model in **Appendix D**).
- San Joaquin kit fox in the Pacheco corridor (denning habitat; see species habitat distribution model in **Appendix D**).
- Bay checkerspot butterfly in serpentine bunchgrass grassland in Bay checkerspot butterfly habitat units (see **Appendix D**).

If suitable breeding habitat<sup>34</sup> for these species as defined in **Table 6-8** and in Conditions 13 and 15–18 is identified on site, and if the proposed project could affect this habitat, additional preconstruction surveys are required for the San Joaquin kit fox, western burrowing owl, tricolored blackbird, and least Bell's vireo. Specific survey requirements for these species are detailed in Conditions 13 and 15–18. Surveys for these species will occur on all areas on which the land cover fee will be levied and within any areas that may be encroaching within a required species buffer.

If applicable land cover types or habitat features are present on site, the application package must describe the methods used for the required surveys and the results of these surveys. As indicated in **Table 6-8**, a map of habitat features (e.g., suitable kit fox dens, suitable burrowing owl burrows) is required. If a covered species is observed on site, details of this observation will also be included in the application. CNDDDB California Native Species Field Survey Forms will be included for all covered species encountered on the site. Copies of these forms will also be submitted to the CNDDDB.

<sup>33</sup> The least Bell's vireo range may expand to the northern portion of the study area during the permit term. The Implementing Entity will periodically monitor outside of the vireo's modeled habitat in the study area to determine if the species' range is expanding (see Section 7.3.3 of Chapter 7, *Species-Level Actions*).

<sup>34</sup> Suitable breeding habitat is defined as habitat identified in the field as suitable for breeding by the target species. Suitable breeding habitat may be different from modeled habitat.

## Preconstruction Surveys for Select Covered Wildlife

If the appropriate land cover type and habitat feature listed in **Table 6-8** are present on site, then a preconstruction survey is required for one or more of the five covered wildlife species listed above (**Figures 6-5 and 6-6**). Preconstruction surveys will be required to establish presence or absence of occupied breeding habitat for the applicable species. For example, if a freshwater wetland that could provide suitable breeding habitat for tricolored blackbird is present on site, a preconstruction survey on the site would need to be conducted prior to construction to determine if the site is occupied. If results indicate that breeding tricolored blackbirds are present, then avoidance and minimization measures and construction monitoring must occur, as described in **Table 6-8** and Condition 17.

The Habitat Plan application package will be prepared before project construction in order to receive project approvals from the local agency (or if by a Permittee, to ensure compliance with the Habitat Plan). To ensure compliance with preconstruction survey requirements, project proponents must describe in the application package which surveys are required, when they will be performed, and how they will be applied to the project. This description will follow the requirements in **Table 6-8** and Conditions 15–18 and will be incorporated into the conditions of project approval.

## Construction Monitoring for Certain Covered Wildlife

Identification of occupied breeding habitat as defined above will trigger the specified avoidance and minimization requirements described in **Table 6-8** and Conditions 15–18. Construction monitoring will be carried out by a qualified biologist to ensure that these avoidance and minimization requirements are being implemented properly and that they are adequately protecting the target species (**Figures 6-4, 6-5, and 6-6**). Because the selected wildlife species are rare in the study area, it is expected that few projects will require construction monitoring. If required, the construction monitoring frequency and protocols are described for the appropriate species in Conditions 15–18.

Like preconstruction surveys, construction monitoring will occur well after the Habitat Plan application package is prepared. To ensure compliance with the Plan, the application package must describe which construction monitoring and avoidance and minimization requirements may be required and how they will be applied to the project if preconstruction surveys identify occupied breeding habitat. This description will follow the requirements in **Table 6-8** and Conditions 15–18 and will be incorporated into the conditions of project approval. The application will include a description of monitoring frequency and duration (including the time when monitoring will be initiated relative to impacts) and specific construction activities to be monitored. The application will also include a description of the authority of the onsite construction monitor to modify or temporarily stop implementation of the activity if necessary to ensure compliance with the Plan.

Construction monitoring is necessary to ensure that avoidance and minimization measures are implemented in accordance with permit requirements and is the responsibility of the project proponent.

## Covered Plant Surveys

Project proponents wishing to affect occurrences of covered plants must notify the Implementing Entity of their construction schedule to allow the Implementing Entity the opportunity to salvage the occurrence (see Condition 19).

The application package must describe the methods used for the required plant surveys and the results of these surveys. If a covered plant occurrence is observed on site, the condition of this occurrence must be described in the application package according to the guidelines in Chapter 5, Section 5.3.1 *Land Acquisition and Restoration Activities* subheading *Incorporating Covered Plant Species*. The condition of each covered plant occurrence must be documented to ensure that occurrences are protected within the Reserve System that are in as good or better condition than those lost to covered activities. CNDDDB California Native Species Field Survey Forms will be included in the application package for all covered plants encountered on the site. Copies of these forms will be submitted to the CNDDDB.

### 6.8.6 Item 6: Compliance Documentation

The final component of the Habitat Plan application package is documentation of how any remaining applicable conditions (Conditions 1–14) have been incorporated into the proposed project. If appropriate, a map will be provided to document this compliance.

Verification that conditions have been implemented is primarily the responsibility of the local jurisdiction conducting or approving the covered activity. Participating local jurisdictions will be responsible for reporting the relevant details of approved projects to the Implementing Entity (for entry into the Habitat Plan database and for required reporting to the Wildlife Agencies). The Implementing Entity may contact the local jurisdiction to verify and ensure that the conditions are appropriately implemented.

If the project includes activities for which temporary fees are paid, the project applicant is required to file compliance information at the conclusion of the project. The compliance information will include documentation that the area for which temporary fees were paid was disturbed by covered activities for less than one year. The project proponent must also provide photographs that document the condition of the site before project initiation and (or less) after completion of the covered activity. Based on this information, the local jurisdiction or Implementing Entity will make a determination that the site was recovered to pre-project or ecologically improved conditions within one year of completing

construction, that the impacts were actually temporary, and that the fees paid were adequate.

## 6.9 Confirming Exemption from the Plan

Project proponents seeking permits from a local jurisdiction for activities that would otherwise be covered will need to demonstrate that the project is not a covered activity per the criteria in Chapter 2. Project proponents will need to:

1. demonstrate the size of the project;
2. show that the project is located in an area in **Figure 6-8** where private development is not subject to the Plan;
3. provide a map consistent with the requirements in Section 6.8.3 *Item 3: Land Cover Types on Site* showing that no serpentine, wetland, stream, riparian, or pond land cover types are present on the site;
4. demonstrate that no adverse indirect impacts to wetlands were identified through the applicable environmental review process; and
5. demonstrate that the project is not located in occupied nesting habitat for western burrowing owl based on the most recent western burrowing owl occupied nesting habitat map provided by the Implementing Entity.

**Table 6-1.** Covered Activities Exempt from Plan Conditions and/or Plan Fees

Covered Activity	Exemptions from Conditions (✓ = exempt)					Development Fees <sup>1</sup>
	All Chapter 6 Conditions	Wildlife Species Surveys (Conditions 15–18)	Preconstruction Surveys (Conditions 15–18)	Construction Monitoring (Conditions 15–18)	Covered Plant Surveys (Condition 20)	
<i>Public Activities</i>						
Routine infrastructure maintenance by public agencies within the planning limit of urban growth that do not affect stream, riparian, serpentine, ponds, or wetland land cover types.	✓	✓	✓	✓	✓	
Routine infrastructure maintenance by public agencies that occurs in urban-suburban, landfill, reservoir, or agriculture developed land cover types that do not affect stream, riparian, serpentine, pond, or wetland cover types. Examples of such activities include filling pot-holes and resurfacing existing roads without expansion of the paved area.	✓	✓	✓	✓	✓	
<i>Private Activities</i>						
Projects that do not result in ground disturbance, do not result in release of potential water quality contaminants, or do not create new wildlife barriers.	✓	✓	✓	✓	✓	
Private-sector, routine-maintenance activities that require a development, grading, or building permit, and that occur inside the Urban Service Area <sup>2</sup> .	✓	✓	✓	✓	✓	
Private-sector, routine-maintenance activities that require a development, grading, or building permit; that occur outside of the Urban Service Area; and that occur within 50 feet of all existing structures at the time of Plan commencement or within 50 feet of structures that are permitted for incidental take under the Habitat Plan.	✓	✓	✓	✓	✓	
Additions to existing structures, or new structures that are within 50 feet of an existing structure (e.g., a new garage) that result in less than 5,000 square feet of impervious surface as long as no stream, riparian woodland, wetlands, ponds, or serpentine land cover type are affected <sup>3</sup> .	✓	✓	✓	✓	✓	✓

Table 6-1. Continued

Covered Activity	Exemptions from Conditions (✓ = exempt)					Development Fees <sup>1</sup>
	All Chapter 6 Conditions	Wildlife Species Surveys (Conditions 15–18)	Preconstruction Surveys (Conditions 15–18)	Construction Monitoring (Conditions 15–18)	Covered Plant Surveys (Condition 20)	
Any covered activity described in Chapter 2 that occurs in urban-suburban, landfill, reservoir, or agriculture developed land cover types as verified in the field, unless the activity may affect a mapped or unmapped stream, riparian, serpentine, ponds, or wetland land cover types, or the activity is located in a stream setback.	✓	✓	✓	✓	✓	
A covered activity on a parcel of less than 0.5 acre or less as long as no serpentine, stream, riparian woodland, pond, or wetland land cover type is within the parcel.	✓	✓	✓	✓	✓	
Covered operations or maintenance activities, including those on the Reserve System, that do not result in any ground disturbance or removal of natural land cover types.		✓	✓	✓		
Covered operations or maintenance activities that occur more than once annually within the same location, as long as applicable surveys are conducted once before initiating the activity and there are negative survey results <sup>4,5</sup> .		✓	✓	✓		
Covered activities that occur entirely on one or more of the following land cover types: coyote brush scrub, reservoir, stream (i.e., riverine) where no riparian or wetland vegetation occurs, agricultural developed <sup>6</sup> , urban-suburban, rural-residential, or ornamental woodland.		✓	✓	✓		
Covered activities that occur entirely on one or more of the following land cover types: willow riparian forest and scrub, redwood forest, coastal and valley freshwater marsh, pond, orchard, vineyard, grain, row crop, hay and pasture, disked/short-term fallowed, golf courses/urban parks or barren.					✓	
Urban development covered activities (see Section 2.3.2 <i>Urban Development</i> in Chapter 2) in Zones A, B, or C on parcels less than 0.5 acre as long as the parcel does not contain or is not adjacent to a stream, riparian woodland or forest, wetland, pond, or serpentine land cover type <sup>8</sup> .						✓

Table 6-1. Continued

Covered Activity	Exemptions from Conditions (✓ = exempt)					
	All Chapter 6 Conditions	Wildlife Species Surveys (Conditions 15– 18)	Preconstruction Surveys (Conditions 15– 18)	Construction Monitoring (Conditions 15–18)	Covered Plant Surveys (Condition 20)	Development Fees <sup>1</sup>
All development that occurs on land mapped by the Habitat Plan as “urban-suburban”, “landfill”, “reservoir”, or “agriculture developed” land cover types if it is not located in or adjacent to a parcel that contains a stream, riparian woodland or forest, wetland, or serpentine land cover type <sup>9, 10</sup> .						✓
Construction of recreational facilities within the Reserve System <sup>11</sup> .						✓

## Notes:

<sup>1</sup> Does not include the Nitrogen Fee. See Chapter 9 for a complete discussion of all Development Fees.

<sup>2</sup> Private-sector activities that do not require a development, grading, or building permit are not subject to the Plan or its conditions or fees.

<sup>3</sup> Additions are cumulative and must be calculated based on the footprint of the structure at time of Plan implementation to determine whether this threshold has been crossed.

<sup>4</sup> Such activities are likely to result in repeated disturbance that will preclude establishment or persistence of the covered wildlife species targeted by these surveys.

<sup>5</sup> If surveys identify covered species, subsequent surveys must be conducted.

<sup>6</sup> The land cover type “agriculture developed” (also known as agriculture developed/covered ag) is defined in Chapter 3 as intensive agricultural operations such as nurseries and greenhouses.

<sup>7</sup> These land cover types do not support any of the covered species for which surveys are required.

<sup>8</sup> If new vehicle trips are generated, the nitrogen deposition fee may be assessed.

<sup>9</sup> The category “reservoir” excludes dams, which are subject to Habitat Plan fees.

<sup>10</sup> Barns, corrals, ranch homes, and other small patches of existing development were not mapped as these four exempt land cover types because they fell below the 10-acre minimum mapping unit. These sites would also be exempt from the same development fees as long as project proponents demonstrate that they were existing at the time of Plan adoption through air photos or other documentation.

<sup>11</sup> Instead of paying a fee for construction of infrastructure within the Reserve System, new disturbance for infrastructure does not count toward land cover type land acquisition requirements in Chapter 5, but it does count toward the total Reserve System size requirements.

**Table 6-2.** Aquatic Avoidance and Minimization Measures

ID	Avoidance and Minimization Measure
	<b>General</b>
1	Minimize the potential impacts on covered species most likely to be affected by changes in hydrology and water quality.
2	Reduce stream pollution by removing pollutants from surface runoff before the polluted surface runoff reaches local streams.
3	Maintain the current hydrograph and, to the extent possible, restore the hydrograph to more closely resemble predevelopment conditions.
4	Reduce the potential for scour at stormwater outlets to streams by controlling the rate of flow into the streams.
5	Invasive plant species removed during maintenance will be handled and disposed of in such a manner as to prevent further spread of the invasive species.
6	Activities in the active (i.e., flowing) channel will be avoided. If activities must be conducted in the active channel, avoidance and minimization measures identified in this table will be applied.
7	Personnel shall prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
8	Spill prevention kits shall always be in close proximity when using hazardous materials (e.g., crew trucks and other logical locations).
9	Personnel shall implement measures to ensure that hazardous materials are properly handled and the quality of water resources is protected by all reasonable means when removing sediments from the streams.
10	<p>If ground disturbing activities are planned for a stream channel that is known or suspected to contain elevated levels of mercury, the following steps should be taken.</p> <ol style="list-style-type: none"> <li>1. Avoid disturbing soils in streams known or suspected to contain high levels of mercury.</li> <li>2. Soils that are likely to be disturbed or excavated shall be tested for mercury. Soils shall be remediated if: <ol style="list-style-type: none"> <li>a. disturbed or excavated soils exposed to flood flows below the 2.33-year channel flow level exceed 1 ppm Hg, or</li> <li>b. disturbed or excavated soils above the 2.33-year flow level exceed 20 ppm Hg.</li> </ol> </li> </ol>
11	Vehicles shall be washed only at approved areas. No washing of vehicles shall occur at job sites.
12	No equipment servicing shall be done in the stream channel or immediate flood plain, unless equipment stationed in these locations cannot be readily relocated (i.e., pumps, generators).
13	Personnel shall use the appropriate equipment for the job that minimizes disturbance to the stream bottom. Appropriately-tired vehicles, either tracked or wheeled, shall be used depending on the situation
14	If high levels of groundwater in a work area are encountered, the water is pumped out of the work site. If necessary to protect water quality, the water shall be directed into specifically constructed infiltration basins, into holding ponds, or onto areas with vegetation to remove sediment prior to the water re-entering a creek.

ID	Avoidance and Minimization Measure
15	<p>If native fish or non-covered, native aquatic vertebrates are present when cofferdams, water bypass structures, and silt barriers are to be installed, a native fish and aquatic vertebrate relocation plan shall be implemented when ecologically appropriate as determined by a qualified biologist to ensure that significant numbers of native fish and aquatic vertebrates are not stranded.</p> <p>Prior to the start of work or during the installation of water diversion structures, native aquatic vertebrates shall be captured in the work area and transferred to another reach as determined by a qualified biologist. Timing of work in streams that supports a significant number of amphibians will be delayed until metamorphosis occurs to minimize impacts to the resource. Capture and relocation of aquatic native vertebrates is not required at individual project sites when site conditions preclude reasonably effective operation of capture gear and equipment, or when the safety of biologist conducting the capture may be compromised.</p> <p>Relocation of native fish or aquatic vertebrates may not always be ecologically appropriate. Prior to capturing native fish and/or vertebrates, the qualified biologist will use a number of factors, including site conditions, system carrying capacity for potential relocated fish, and flow regimes (e.g., if flows are managed) to determine whether a relocation effort is ecologically appropriate. If so, the following factors will be considered when selecting release site(s):</p> <ol style="list-style-type: none"> <li>1. similar water temperature as capture location;</li> <li>2. ample habitat availability prior to release of captured individuals;</li> <li>3. presence of other same species so that relocation of new individuals will not upset the existing prey/predation function;</li> <li>4. carrying capacity of the relocation location;</li> <li>5. potential for relocated individual to transport disease; and</li> <li>6. low likelihood of fish reentering work site or becoming impinged on exclusion net or screen.</li> </ol> <p>Proposals to translocate any covered species will be reviewed and approved by the Wildlife Agencies.</p>
16	<p>When work in a flowing stream is unavoidable, the entire streamflow shall be diverted around the work area by a barrier, except where it has been determined by a qualified biologist that the least environmentally disruptive approach is to work in a flowing stream. Where feasible, water diversion techniques shall allow stream flows to gravity flow around or through the work site.</p>
17	<p>Coffer dams shall be installed both upstream and downstream not more than 100 feet from the extent of the work areas. Coffer dam construction shall be adequate to prevent seepage into or from the work area. Stream flow will be pumped around the work site using pumps and screened intake hoses. All water shall be discharged in a non-erosive manner (e.g., gravel or vegetated bars, on hay bales, on plastic, on concrete, or in storm drains when equipped with filtering devices, etc.).</p>
18	<p>Small in-channel berms that deflect water to one side of the channel during project implementation may be constructed of channel material in channels with low flows.</p>
19	<p>Sumps or basins may also be used to collect water, where appropriate (e.g., in channels with low flows).</p>
20	<p>Diversions shall maintain ambient stream flows below the diversion, and waters discharged below the project site shall not be diminished or degraded by the diversion. All materials placed in the channel to dewater the channel shall be removed when the work is completed. Normal flows shall be restored to the affected stream as soon as is feasible and safe after completion of work at that location.</p>
21	<p>To the extent that stream bed design changes are not part of the project, the stream bed will be returned to as close to pre-project condition as appropriate.</p>
22	<p>To the extent feasible, all temporary diversion structures and the supportive material shall be removed no more than 48 hours after work is completed.</p>
23	<p>Temporary fills, such as for access ramps, diversion structures, or cofferdams, shall be completely removed upon finishing the work.</p>
24	<p>To prevent increases in temperature and decreases in dissolved oxygen (DO), if bypass pipes are used, they shall be properly sized (i.e., larger diameter pipes to better pass the flows). Use of bypass pipes may be avoided by creating a low-flow channel or using other methods to isolate the work area.</p>

ID	Avoidance and Minimization Measure
25	Diversions shall maintain fish passage when the project meets the following conditions: 1) the length of the area dewatered exceeds 500 feet, and/or 2) the length of time the stream is dewatered exceeds two weeks in length. Conditions for fish passage shall be met as long as the diversion 1) maintains contiguous flows through a low flow channel in the channel bed or an artificial open channel, 2) presents no vertical drops exceeding six (6) inches and follows the natural grade of the site, 3) maintains water velocities that shall not exceed eight feet per second (8 ft/sec), and 4) maintains adequate water depths consistent with normal conditions in the project reach. An artificial channel used for fish passage shall be lined with cobble/gravel. A closed conduit pipe shall not be used for fish passage. The inlets of diversions shall be checked daily to prevent accumulation of debris.
26	Any sediment removed from a project site shall be stored and transported in a manner that minimizes water quality impacts.
27	Sediment from the San Francisco Bay Watershed, including that for reuse, will not be removed to areas any farther south than Metcalf Road in south San Jose.
28	Where practical, the removed sediments and gravels will be re-used.
29	Existing native vegetation shall be retained by removing only as much vegetation as necessary to accommodate the trail clearing width. Maintenance roads should be used to avoid effects on riparian corridors.
30	Vegetation control and removal in channels, on stream banks, and along levees and maintenance roads shall be limited to removal necessary for facility inspection purposes, or to meet regulatory requirements or guidelines.
31	When conducting vegetation management, retain as much understory brush and as many trees as feasible, emphasizing shade producing and bank stabilizing vegetation.  If riparian vegetation is to be removed with chainsaws, consider using saws currently available that operate with vegetable-based bar oil.
32	In-channel vegetation removal may result in increased local erosion due to increased flow velocity. To minimize the effect, the top of the bank shall be protected by leaving vegetation in place to the maximum extent possible.
33	Regional Board objectives for temperature change in receiving waters (measured 100 feet downstream of discharge point) shall not be exceeded. Receiving water and discharge water may be monitored for temperature changes after a comparison of ambient temperature to pipeline water temperature suggests the potential for change.
<b>Project Design</b>	
34	Use the minimum amount of impermeable surface (building footprint, paved driveway, etc.) as practicable.
35	Use pervious materials, such as gravel or turf pavers, in place of asphalt or concrete to the extent practicable.
36	Use flow control structures such as swales, retention/detention areas, and/or cisterns to maintain the existing (pre-project) peak runoff.
37	Direct downspouts to swales or gardens instead of storm drain inlets.
38	Use flow dissipaters at runoff inlets (e.g., culvert drop-inlets) to reduce the possibility of channel scour at the point of flow entry.
39	Minimize alterations to existing contours and slopes, including grading the minimum area necessary.
40	Maintain native shrubs, trees and groundcover whenever possible and revegetate disturbed areas with local native or non-invasive plants.
41	Combine flow-control with flood control and/or treatment facilities in the form of detention/retention basins, ponds, and/or constructed wetlands.
42	Use flow control structures, permeable pavement, cisterns, and other runoff management methods to ensure no change in post-construction peak runoff volume from pre-project conditions for all covered activities with more than 5,000 square feet of impervious surface.
43	Site characteristics will be evaluated in advance of project design to determine if non-traditional designs, such as bioengineered bank treatments that incorporate live vegetation, can be successfully utilized while meeting the requirements of the project.
44	Maintenance of natural stream characteristics, such as riffle-pool sequences, riparian canopy, sinuosity, floodplain, and a natural channel bed, will be incorporated into the project design.

ID	Avoidance and Minimization Measure
45	Stream crossings shall incorporate a free-span bridge unless infeasible due to engineering or cost constraints or unsuitable based on minimal size of stream (swale without bed and banks or a very small channel). If a bridge design cannot free-span a stream, bridge piers and footings will be designed to have minimum impact on the stream. A hydraulics analysis must be prepared and reviewed by the jurisdictional partner, including SCVWD as appropriate, demonstrating that piers or footings will not cause significant scour or channel erosion. Whenever possible, the span of bridges will also allow for upland habitat beneath the bridge to provide undercrossing areas for wildlife species that will not enter the creek. Native plantings, natural debris, or scattered rocks will be installed under bridges to provide wildlife cover and encourage the use of crossings.
46	Whenever possible, the span of bridges will also allow for upland habitat beneath the bridge to provide undercrossing areas for wildlife species that will not enter the creek.
47	If a culvert is used, up- and downstream ends of the culvert must be appropriately designed so that the stream cannot flow beneath the culvert or create a plunge pool at the downstream end. Preference will be given to designs that allow a natural bottom (arch culvert) and/or which do not alter natural grade.
48	Trails will be sited and designed with the smallest footprint necessary to cross through the in-stream area. Trails will be aligned perpendicular to the channel and be designed to avoid any potential for future erosion. New trails that follow stream courses will be sited outside the riparian corridor.
49	The project or activity must be designed to avoid the removal of riparian vegetation, if feasible. If the removal of riparian vegetation is necessary, the amount shall be minimized to the amount necessary to accomplish the required activity and comply with public health and safety directives.
50	If levee reconstruction requires the removal of vegetation that provides habitat value to the adjacent stream (e.g., shading, bank stabilization, food sources, etc.), then the project will include replacement of the vegetation/habitat that was removed during reconstruction unless it is determined to be inappropriate to do so by the relevant resource agencies (e.g., CDFG and USFWS).
51	All projects will be conducted in conformance with applicable County and/or city drainage policies.
52	Adhere to the siting criteria described for the borrow site covered activity (see Chapter 2 for details).
53	When possible, maintain a vegetated buffer strip between staging/excavation areas and receiving waters.
54	When not within the construction footprint, deep pools within stream reaches shall be maintained as refuge for fish and wildlife by constructing temporary fencing and/or barrier so as to avoid pool destruction and prevent access from the project site.
55	For stream maintenance projects that result in alteration of the stream bed during project implementation, its low flow channel shall be returned to its approximate prior location with appropriate depth for fish passage without creating a potential future bank erosion problem.
56	Increased water velocity at bank protection sites may increase erosion downstream. Therefore, bank stabilization site design shall consider hydraulic effects immediately upstream and downstream of the work area. Bank stabilization projects will be designed and implemented to provide similar roughness and characteristics that may affect flows as the surrounding areas just upstream and downstream of the project site.
57	When parallel to a stream or riparian zone and not located on top of a levee, new trails shall be located behind the top of bank or at the outside edge of the riparian zone except where topographic, resource management, or other constraints or management objectives make this not feasible or undesirable.
58	Existing access routes and levee roads shall be used if available to minimize impacts of new construction in special status species habitats and riparian zones.
59	Trails in areas of moderate or difficult terrain and adjacent to a riparian zone shall be composed of natural materials or shall be designed (e.g., a bridge or boardwalk) to minimize disturbance and need for drainage structures, and to protect water quality.
60	Trail crossings of freshwater stream zones and drainages shall be designed to minimize disturbance, through the use of bridges or culverts, whichever is least environmentally damaging. Structures over water courses shall be carefully placed to minimize disturbance. Erosion control measures shall be taken to prevent erosion at the outfalls of drainage structures.

ID	Avoidance and Minimization Measure
<b>Construction</b>	
61	Minimize ground disturbance to the smallest area feasible.
62	Use existing roads for access and disturbed area for staging as site constraints allow. Off-road travel will avoid sensitive communities such as wetlands and known occurrences of covered plants.
63	Prepare and implement sediment erosion control plans.
64	No winter grading unless approved by City Engineer and specific erosion control measures are incorporated.
65	Control exposed soil by stabilizing slopes (e.g., with erosion control blankets) and protecting channels (e.g., using silt fences or straw wattles).
66	Control sediment runoff using sandbag barriers or straw wattles.
67	No stockpiling or placement of erodible materials in waterways or along areas of natural stormwater flow where materials could be washed into waterways.
68	Stabilize stockpiled soil with geotextile or plastic covers.
69	Maintain construction activities within a defined project area to reduce the amount of disturbed area.
70	Only clear/prepare land which will be actively under construction in the near term.
71	Preserve existing vegetation to the extent possible.
72	Equipment storage, fueling and staging areas will be sited on disturbed areas or non-sensitive habitat outside of a stream channel.
73	Avoid wet season construction.
74	Stabilize site ingress/egress locations.
75	Dispose of all construction waste in designated areas and prevent stormwater from flowing onto or off of these areas.
76	Prevent spills and clean up spilled materials.
77	Sweep nearby streets at least once a day.
78	In-stream projects occurring while the stream is flowing must use appropriate measures to protect water quality, native fish and covered wildlife species at the project site and downstream of the project site.
79	If mercury contamination may be present, the channel must be dewatered prior to commencement of the activity.
80	All personnel working within or adjacent to the stream setback (i.e., those people operating ground-disturbing equipment) will be trained by a qualified biologist in these avoidance and minimization measures and the permit obligations of project proponents working under this Plan.
81	Temporary disturbance or removal of aquatic and riparian vegetation will not exceed the minimum necessary to complete the work.
82	Channel bed temporarily disturbed during construction activities will be returned to pre-project or ecologically improved conditions at the end of construction.
83	Sediments will be stored and transported in a manner that minimizes water quality impacts. If soil is stockpiled, no runoff will be allowed to flow back to the channel.
84	Appropriate erosion control measures (e.g., fiber rolls, filter fences, vegetative buffer strips) will be used on site to reduce siltation and runoff of contaminants into wetlands, ponds, streams, or riparian vegetation. Fiber rolls used for erosion control will be certified as free of noxious weed seed. Filter fences and mesh will be of material that will not entrap reptiles and amphibians. Erosion control measures will be placed between the outer edge of the buffer and the project site.
85	Seed mixtures applied for erosion control will not contain invasive nonnative species and will be composed of native species or sterile nonnative species. If sterile nonnative species are used for temporary erosion control, native seed mixtures must be used in subsequent treatments to provide long-term erosion control and slow colonization by invasive nonnatives.
86	Topsoil removed during soil excavation will be preserved and used as topsoil during revegetation when it is necessary to conserve the natural seed bank and aid in revegetation of the site.
87	Vehicles operated within and adjacent to streams will be checked and maintained daily to prevent leaks of materials that, if introduced to the water, could be deleterious to aquatic life.

ID	Avoidance and Minimization Measure
88	Vehicles and equipment will be parked on pavement, existing roads, and previously disturbed areas.
89	The potential for traffic impacts on terrestrial animal species will be minimized by adopting traffic speed limits.
90	All trash will be removed from the site daily to avoid attracting potential predators to the site. Personnel will clean the work site before leaving each day by removing all litter and construction-related materials.
91	To prevent the spread of exotic species and reduce the loss of native species, aquatic species will be netted at the drain outlet when draining reservoirs or ponds to surface waters. Captured native fish, native amphibians, and western pond turtles will be relocated if ecologically appropriate. Exotic species will be dispatched.
92	To minimize the spread of pathogens all staff working in aquatic systems (i.e., streams, ponds, and wetlands)—including site monitors, construction crews, and surveyors—will adhere to the most current guidance for equipment decontamination provided by the Wildlife Agencies at the time of activity implementation. Guidance may require that all materials that come in contact with water or potentially contaminated sediments, including boot and tire treads, be cleaned of all organic matter and scrubbed with an appropriate cleansing solution, and that disposable gloves be worn and changed between handling equipment or animals. Care should be taken so that all traces of the disinfectant are removed before entering the next aquatic habitat.
93	When accessing upland areas adjacent to riparian areas or streams, access routes on slopes of greater than 20% should generally be avoided. Subsequent to access, any sloped area should be examined for evidence of instability and either revegetated or filled as necessary to prevent future landslide or erosion.
94	Personnel shall use existing access ramps and roads if available. If temporary access points are necessary, they shall be constructed in a manner that minimizes impacts to streams.
95	To prevent inadvertent entrapment of animals during excavation, all excavated, steep-walled holes or trenches more than 2-feet deep will be covered at the close of each working day by plywood or similar materials, or provided with one or more escape ramps constructed of earth fill or wooden planks.
96	Isolate the construction area from flowing water until project materials are installed and erosion protection is in place.
97	Erosion control measures shall be in place at all times during construction. Do not start construction until all temporary control devices (straw bales, silt fences, etc.) are in place downstream of project site.
98	When needed, utilize in-stream grade control structures to control channel scour, sediment routing, and headwall cutting.
<b>Post-Construction</b>	
99	Conduct street cleaning on a regular basis
100	Potential contaminating materials must be stored in covered storage areas or secondary containment that is impervious to leaks and spills
101	Runoff pathways shall be free of trash containers or trash storage areas. Trash storage areas shall be screened or walled
102	Immediately after project completion and before close of seasonal work window, stabilize all exposed soil with mulch, seeding, and/or placement of erosion control blankets .
103	All disturbed soils will be revegetated with native plants and/or grasses or sterile nonnative species suitable for the altered soil conditions upon completion of construction. Local watershed native plants will be used if available. If sterile nonnative species are used for temporary erosion control, native seed mixtures must be used in subsequent treatments to provide long-term erosion control and slow colonization by invasive nonnatives. All disturbed areas that have been compacted shall be de-compacted prior to planting or seeding. Cut-and-fill slopes will be planted with local native or non-invasive plants suitable for the altered soil conditions.
104	Measures will be utilized on site to prevent erosion along streams (e.g., from road cuts or other grading), including in streams that cross or are adjacent to the project proponent's property. Erosion control measures will utilize natural methods such as erosion control mats or fabric, contour wattling, brush mattresses, or brush layers. For more approaches and detail, please see the <i>Bank Protection/ Erosion Repair Design Guide</i> in the Santa Clara Valley Water Resources Protection Collaborative's <i>User Manual: Guidelines &amp; Standards for Land Use Near Streams</i> (Santa Clara Valley Water Resources Protection Collaborative 2006).

ID	Avoidance and Minimization Measure
105	Vegetation and debris must be managed in and near culverts and under and near bridges to ensure that entryways remain open and visible to wildlife and that passage through the culvert or bridge remains clear.
106	Prior to undertaking stream maintenance activities, reach conditions will be assessed to identify tasks that are necessary to maintain the channel for the purpose for which it was designed and/or intended (e.g., flood control, groundwater recharge). Only in-stream work that is necessary to maintain the channel will be conducted.
107	On streams managed for flood control purposes, when stream reaches require extensive vegetation thinning or removal (e.g., when the channel has been fully occluded by willows or other vegetation), removal will be phased so that some riparian land cover remains and provides some habitat value. In addition, vegetation removal will be targeted and focused on removing the least amount of riparian vegetation as possible while still meeting the desired flood control needs. For example, vegetation removal should be focused on shrubby undergrowth at the toe-of-slope that is most likely to increase roughness and create a flooding hazard. Vegetation on the upper banks, particularly mature tree canopy, should be maintained to the extent possible to provide habitat for birds and small mammals and shading for the active channel.
108	When reaches require sediment removal, approaches will be considered that may reduce the impacts of the activity. Examples of potential approaches include phasing of removal activities or only removing sediment along one half of the channel bed, allowing the other half to remain relatively undisturbed.
109	In streams not managed for flood control purposes, woody material (including live leaning trees, dead trees, tree trunks, large limbs, and stumps) will be retained unless it is threatening a structure, impedes reasonable access, or is causing bank failure and sediment loading to the stream.
110	If debris blockages threaten bank stability and may increase sedimentation of downstream reaches, debris will be removed. When clearing natural debris blockages (e.g., branches, fallen trees, soil from landslides) from the channel, only remove the minimum amount of debris necessary to maintain flow conveyance (i.e., prevent significant backwatering or pooling). Non-natural debris (e.g., trash, shopping carts, etc.) will be fully removed from the channel.
111	If bank failure occurs due to debris blockages, bank repairs will only use compacted soil, and will be re-seeded with native grasses or sterile nonnative hybrids and stabilized with natural erosion control fabric. If sterile nonnative species are used for temporary erosion control, native seed mixtures must be used in subsequent treatments to provide long-term erosion control and slow colonization by invasive nonnatives. If compacted soil is not sufficient to stabilize the slope, bioengineering techniques must be used. No hardscape (e.g., concrete or any sort of bare riprap) or rock gabions may be utilized in streams not managed for flood control except in cases where infrastructure or human safety is threatened (e.g., undercutting of existing roads). Rock riprap may only be used to stabilize channels experiencing extreme erosion, and boulders must be backfilled with soil and planted with willows or other native riparian species suitable for planting in such a manner. If available, local native species will be utilized as appropriate.
112	Pumps and generators shall be maintained and operated in a manner that minimizes impacts to water quality and aquatic species.
113	The channel bottom shall be re-graded at the end of the work project to as close to original conditions as possible.
114	Erosion control methods shall be used as appropriate during all phases of routine maintenance projects to control sediment and minimize water quality impacts.
115	All construction pipes, culverts, or similar structures with a diameter of 4 inches or greater that are stored at a construction site for one or more overnight periods will be thoroughly inspected for wildlife by properly trained construction personnel before the pipe is subsequently buried, capped, or otherwise used or moved in anyway.

<sup>2</sup> The scope of this review will be limited to the design, location, and extent of the median barrier.					

**Table 6-4. Rural Road Maintenance Avoidance and Minimization Measures**

		Sediment Management and Erosion Control							Road Maintenance									
		General Construction	Hillside Activities	Spoils Handling and Disposal	Mass Wasting Repair	Minor Slide Repair	Storm-Proofing	Culverts	General	Shoulder Maintenance	Dirt Road Maintenance	Ditch Maintenance	Drainage Systems	Sidcasting	Water Drafting	Vegetation Management	Dust Control	Concrete Work
Avoidance and Minimization Measures																		
1	Incorporate erosion control into the planning, construction and follow up phases for all road activities.	X	X	X		X	X	X	X	X	X	X	X	X		X		
2	If working during times when rain might be possible, always have erosion control measures onsite in case of a storm event.	X	X	X		X	X	X	X	X	X	X	X	X				
3	Plan for projects involving disturbance of soil (earthwork) within the riparian setback to occur during the salmonid avoidance season (June 15–October 15) with the exception of emergency or public safety related projects (e.g., clearing a landslide across a road). If avoidance is not possible, utilize appropriate avoidance and minimization measures as described in Conditions 4 and 5.	X	X	X		X	X	X	X	X	X	X	X	X		X		X
4	Set up the work and staging area to minimize the area of soil that will be disturbed and the tracking of soil out of the work area by vehicles and equipment.	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
5	When possible, avoid staging projects in areas where runoff will be concentrated.	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
6	Do not stage maintenance equipment in riparian areas or adjacent to streams with the exception of emergency or public safety related projects where no other staging options exist. Avoidance and minimization measures described in Conditions 4 and 5 will be applied as appropriate.	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
7	Use appropriate erosion and sediment control avoidance and minimization measures to secure the staging and project area so that sediment runoff is avoided. Avoidance and minimization measures described in Conditions 4 and 5 will be applied as appropriate.	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
8	Protect storm drain inlets and watercourses using appropriate avoidance and minimization measures. Avoidance and minimization measures described in Conditions 4 and 5 will be applied as appropriate.	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
9	Mulch or revegetate bare soil adjacent to stream channels, or other flow transport paths, to the break-in-slope near those areas.	X	X	X	X	X			X	X		X	X			X		

**Table 6-4. Continued**[illegible]

**Table 6-4. Continued**[illegible]

Table 6-4. Continued

		Sediment Management and Erosion Control							Road Maintenance									
		General Construction	Hillside Activities	Spoils Handling and Disposal	Mass Wasting Repair	Minor Slide Repair	Storm-Proofing	Culverts	General	Shoulder Maintenance	Dirt Road Maintenance	Ditch Maintenance	Drainage Systems	Sidecasting	Water Drafting	Vegetation Management	Dust Control	Concrete Work
Avoidance and Minimization Measures																		
29	Avoid disturbance of vegetation outside the essential shoulder area, especially near ditches, streams or watercourses. These vegetated areas help filter sediment from water run-off into ditches or streams and helps prevent erosion.	X							X							X		
30	Grade ditches only when necessary to keep the ditchline free flowing and restore capacity. Unnecessary mechanical grading can cause excess erosion, undermine banks, and expose the toe of the cutslope to erosion or slope failure.											X	X					
31	To control vegetation (rather than remove it entirely), use methods like mowing or weed-whacking when feasible. Vegetation prevents scour and filters out sediment.		X						X			X				X		
32	Whenever feasible, maintain a buffer of vegetation between the ditch and the road. This helps filter sediment from runoff and can be accomplished by using a steeper angle on the grader blade.	X	X						X			X				X		
33	Avoid harming existing vegetation on the cutbank above the ditch to reduce erosion and prevent slope failure.	X	X				X		X			X						
34	When “pulling” a ditch (mechanically grading and removing fine sediment), when possible, avoid spreading ditch spoils across or into the surface rock of the road or shoulder. Consider incorporating the removed soil into localized infrastructure (e.g., trails) and compact soil in place.											X						
35	The recommended minimum diameter for all new culverts, including cross drains, but exclusive of driveway culverts, is 18 inches. Often, small diameter culverts (12 inches or less) plug with debris, causing significant road damage. They are also difficult to clean out.	X						X	X				X					

**Table 6-4. Continued**[illegible]

Table 6-4. Continued

		Sediment Management and Erosion Control							Road Maintenance									
		General Construction	Hillside Activities	Spoils Handling and Disposal	Mass Wasting Repair	Minor Slide Repair	Storm-Proofing	Culverts	General	Shoulder Maintenance	Dirt Road Maintenance	Ditch Maintenance	Drainage Systems	Sidecasting	Water Drafting	Vegetation Management	Dust Control	Concrete Work
Avoidance and Minimization Measures																		
41	Designate areas to be used for concrete washout and perform washout only in properly constructed containments. When washing equipment or vehicles to remove cement or concrete residue, use only as much water as is needed so that rinse water can be properly contained. For example, use a positive shutoff on the washout hose.																	X
42	Follow these procedures for concrete mixing on site. - Ensure that contractors who fuel and operate cement mixing operations on site have an adequate spill plan and materials for spill containment. - Avoid mixing excess amounts of fresh concrete or cement on site. - Establish mixing plants outside of riparian corridors or near watercourses. - Dry and wet materials should be stored away from waterways and storm drains and should be covered and contained to prevent runoff from rainfall.																	X
43	Remove concrete grindings, rubble, and debris from the site for proper disposal and do not discharge into drain inlets, the storm water drainage system or watercourses.																	X
44	Contain coolant water from concrete cutting and do not discharge into drain inlets, the storm water drainage system or watercourses.																	X
45	When fresh concrete may be exposed to water, (e.g. rainy weather work), use concrete sealants that are approved by the California Department of Fish and Game for this purpose.																	X
46	Perform all in-stream work in dry conditions, and do not work in flowing waters. If a stream is flowing, use a cofferdam or other dewatering avoidance and minimization measures as needed. See Condition 4 for dewatering avoidance and minimization measures.	X						X	X				X					

Table 6-4. Continued

		Sediment Management and Erosion Control							Road Maintenance									
		General Construction	Hillside Activities	Spoils Handling and Disposal	Mass Wasting Repair	Minor Slide Repair	Storm-Proofing	Culverts	General	Shoulder Maintenance	Dirt Road Maintenance	Ditch Maintenance	Drainage Systems	Sidecasting	Water Drafting	Vegetation Management	Dust Control	Concrete Work
Avoidance and Minimization Measures																		
47	Identify and map existing permanent disposal sites that can be used for long-term disposal of materials from routine and emergency maintenance activities and provide this information to maintenance crews. These sites should be in upland areas, such as rock pits, ridges, and benches. Locations should be above the 100-year floodplain of the closest stream and away from any groundwater seeps or wetlands.			X	X				X									
48	Minimize disturbance of ground cover or grass on the shoulder to the extent possible (the shoulder is part of the road right-of-way and may need to be kept clear for safety purposes), near ditches and outside of the road right-of-way. If the ground is bladed clean during mowing, the exposed soil will be vulnerable to erosion and could run-off into a creek. Vegetation can also act as a pollution filter that traps sediment and other runoff before it gets into ditches or streams.															X		
49	General guidelines for working within the road right-of-way: - Do not mow beyond 8 feet from the edge of the pavement unless that vegetation must be removed to retain existing drainage patterns or for safety reasons. - Do not remove brush more than 20 feet on either side of the road at bridge structures, unless additional removal is required to address safety concerns or to control noxious weeds. - Do not remove brush more than 10 feet on either side of a culvert, or 10 feet up and downstream from culverts that are 6-feet in diameter or larger, unless management is required for safety concerns or to control noxious weeds. NOTE: Fire management requirements must be considered when using this avoidance and minimization measure.							X	X	X						X

# Chapter 7

## Monitoring and Adaptive Management Program

### 7.1 Introduction

This chapter describes the monitoring and adaptive management program for the Plan. The purposes of this program are to ensure compliance with the Plan; to assess the status of covered and other native species, natural communities, and ecosystem processes within the Reserve System<sup>1</sup> and in certain habitat types outside of the Reserve System; and to evaluate the effects of management actions such that the conservation strategy described in Chapter 5, including the biological goals and objectives (**Tables 5-1a–d**)<sup>2</sup> of the Plan are achieved. Adaptive management and monitoring will be integrated into one cohesive program where monitoring will inform and change management actions to continually improve outcomes for covered and other native species and natural communities. An overview of the program, monitoring and management actions, and data and reporting requirements are found below. Monitoring issues and tools relevant to the three levels of the conservation strategy (landscape, natural community, and species) are described in detail in **Appendix J**.

#### 7.1.1 Regulatory Context

By regulation, an HCP must incorporate monitoring of conservation measures and the response of covered species to these measures (50 CFR 17.22[b][1][iii] and 50 CFR 222.22[b][5][iii]). An adaptive management strategy is a recommended component of Plans with data gaps that would substantively affect how the species is managed and monitored in the future (65 FR 35251). The USFWS and NMFS Five-Point Policy (65 FR 35241–35257) describes adaptive management as an integrated method for addressing uncertainty in natural resource management and states that management must be linked to measurable

---

<sup>1</sup> In general conservation actions and monitoring take place within the Reserve System (i.e., lands acquired, managed, and monitored by the Implementing Entity to benefit covered species under this Plan). Monitoring for burrowing owl and tricolored blackbirds will extend beyond the Reserve System boundaries as described below. Monitoring outside of the Reserve System will still occur within the Plan's study area.

<sup>2</sup> The biological goals and objectives conform to the guidance provided by the Five Point Policy as much as feasible, given the scope of the conservation strategy and the fact that the Reserve System has not yet been acquired. In some cases, details on the indicator, location, timeframe, etc. are provided in the narrative text of the conservation strategy. In other cases these details will be developed during early implementation where on-the-ground information can better inform specific management actions for specific parcels. These details will be integrated into the reserve management plans.

biological goals and monitoring. To that end, **Tables 5-1a–d** integrate biological goals and objectives, conservation actions, and monitoring actions to ensure that the program evaluates the conservation measures and assesses the implementation of the biological goals and objectives.

An NCCP must include both a monitoring program and an adaptive management program (California Fish and Game Code Section 2820[7] and [8]). An NCCP also must integrate adaptive management strategies that are periodically reviewed and modified on the basis of the results of monitoring efforts and other sources of new information (California Fish and Game Code Section 2820[a][2]).

The monitoring and adaptive management program described in this chapter is intended to fulfill HCP and NCCP requirements to monitor covered species, natural communities, and species response to management activities. This program will continually incorporate recommendations for monitoring and adaptive management based on the most recent guidelines provided by the USGS Biological Resources Division, CDFG, and USFWS for regional HCPs and NCCPs (Atkinson et al. 2004).

## 7.1.2 Adaptive Management

Adaptive Management is a decision-making process promoting flexible management such that actions can be adjusted as uncertainties become better understood or as conditions change (**Figure 7-2**). Monitoring the outcomes of management is the foundation of an adaptive approach, and thoughtful monitoring can both advance scientific understanding and modify management actions iteratively (Williams et al. 2007).

Adaptive management is necessary because of the degree of uncertainty and natural variability associated with ecosystems and their responses to management. Based on the best scientific information currently available, it is expected that the Plan's conservation actions will effectively implement the conservation strategy described in Chapter 5. However, there are varying degrees of uncertainty associated with the management techniques and conditions within and outside the study area. In addition, the status of covered species and natural communities may change in unexpected ways during Plan implementation. It is possible that additional and different management measures not identified in the Plan will be identified in the future and proven to be more effective in implementing the conservation strategy described in Chapter 5 than those currently implemented. Results of effectiveness monitoring may also indicate that some management measures are less effective than anticipated. To address these uncertainties, an adaptive approach will be used to inform management; the monitoring program will be designed to support this adaptive approach.

The cornerstone of the monitoring and adaptive management program is an experimental approach in which monitoring will yield scientifically valid results that inform management decisions (**Figure 7-3**). Information collected through

monitoring and other experiments will be used to manage reserve lands and protect covered and other native species habitat and natural communities. The adaptive management process will be administered by the Implementing Entity. The Implementing Entity will also coordinate and share the results of monitoring and targeted studies, as appropriate, with other regional restoration and management programs and among the Local Partners and the Wildlife Agencies. A well-coordinated and scalable monitoring program will enable the Implementing Entity and others to measure and evaluate change in resources and threats within individual reserves, across the entire study area, and throughout the ecoregion. Such coordination requires standardization of protocols, sampling design, and training of personnel, as well as integrative data analysis.

Another important component of the adaptive management process is outside review by scientists. Science advisors (see Section 7.2.3 *Program Implementation* subheading *Program Infrastructure*) will evaluate the effectiveness of existing or proposed management actions. The Implementing Entity will incorporate recommendations provided by these reviews, where appropriate, into Plan implementation. It is also intended that the adaptive management program will provide the basis for budget and funding decisions throughout the term of the Plan and in accordance with active adaptive management principles (see **Figure 7-4**).

Integrating adaptive management and monitoring is critical to the successful implementation of the conservation strategy. Monitoring is the foundation of an adaptive approach, and adaptive management actions are developed, in part, from the results of monitoring. In this Plan, the two components are integrated into a single program.

The monitoring and adaptive management program will inform reserve managers and other decision makers of the status of covered and other native species, natural communities, and essential ecological processes such that management actions can be revised when necessary to meet the biological goals of the Plan. The effectiveness of conservation efforts will be evaluated following the model outlined in **Figure 7-4**. This figure illustrates how indicators and success criteria will be developed and how monitoring will be used to ensure the effectiveness of the Plan. The use of conceptual ecological models will also guide monitoring and adaptive management (see **Figure 7-5**). Conceptual models will help frame questions for monitoring, and results will help guide future management and monitoring efforts while simultaneously updating the models (see **Figures 7-6** and **7-7**). Using monitoring to provide information for adaptive management actions will require a framework for measuring responses (**Figure 7-3**). In its simplest form, monitoring that happens immediately after management actions occur will inform future efforts. However, as **Figure 7-3** illustrates, management actions must be developed in concert with monitoring objectives such that increased certainty regarding the significance of the results can be obtained. Pilot projects will be carried out (see Section 7.2.1 *Types of Monitoring* subheading *Targeted Studies*, below), whereby management actions will be treated as experiments, and monitoring will be used to evaluate each action. This will allow management to proceed without complete knowledge of the needs of

the species or ecological processes. All of these components are described more fully in the following sections.

In summary, adaptive management is the land manager's response to new information. Adaptive management actions will likely take place at the following junctures:

- a) In response to the results of targeted studies including pilot projects,
- b) In response to downward trends in the status of covered species or key natural-community variables,
- c) When new information from the literature or other relevant research indicates that a feasible and superior alternative method for achieving the biological goals and objectives exists,
- d) When monitoring indicates that the expected or desired result of a management action did not take place, and
- e) Proactively, when threats are identified through the ongoing development of conceptual models (see **Appendix J**, Section J.2.2 *Natural Community Monitoring Tools* and **Figures 7-6 through 7-9**) or through other monitoring efforts in the study area. An example of an adaptive management action resulting from a pilot project is the decision to use deer exclusion fencing rather than willow planting in target stream reaches to achieve stream restoration based on the empirical results of the study.

Most adaptive management measures will occur when conservation actions do not produce the desired outcome or when species /natural-community trends decrease. In these cases, new actions would be implemented to try and improve the outcome for species and communities. Such actions include but are not limited to the following:

- Alter the timing, location, intensity or type of grazing;
- Reduce, increase or otherwise change the pattern of prescribed burning;
- Change the flow regime released from reservoirs into target streams (e.g., timing, frequency, magnitude of flow levels or events);
- Re-evaluate and, if necessary, alter avoidance and minimization measures;
- Modify age, timing, location, or type of seedling transplantation for natural-community restoration;
- Prioritize or de-emphasize one aspect of noxious weed control such as targeted pesticide use;
- Increase, decrease or desist species-specific conservation actions such as translocation of individuals based on experimental results.

Any of the conservation actions proposed in **Tables 5-1a–d** can be modified in response to new information following the principles of adaptive management.

### 7.1.3 Program Objectives

The overarching objective of the monitoring and adaptive management program is to ensure that the conservation strategy described in Chapter 5 and the biological goals and objectives (**Tables 5-1a–d**) are being achieved. This chapter presents a foundation for accomplishing this task. The reserve unit management plans, which will include monitoring and adaptive management components, will be submitted to the Wildlife Agencies for review and approval within 5 years of the acquisition of the first parcel of each reserve unit. Additional objectives of the monitoring and adaptive management program are listed below.

- Provide an organizational framework and decision-making process for evaluating monitoring, targeted studies, and other data to adjust management actions.
- Document the baseline condition of biological resources in the Reserve System and other key habitat outside of the Reserve System using existing data, modeling, and the results of ongoing field surveys.
- Develop conceptual models for natural communities and covered species, if applicable, that can be used as the basis for collecting information, verifying hypotheses, and designing and changing management practices (see **Appendix J**, Section J.2.2 *Natural Community Monitoring Tools* and **Figures 7-6 through 7-9**).
- Incorporate hypothesis testing and experimental management, including targeted studies to address key uncertainties and to improve management and monitoring efforts.
- Develop and implement scientifically valid monitoring protocols at multiple levels to ensure that data collected will inform management and integrate with other monitoring efforts.
- Ensure that monitoring data are collected, analyzed, stored, and organized so the data are accessible to the Implementing Entity, the Permittees, regulatory agencies, scientists and, as appropriate, the public.

### 7.1.4 Program Scope

Designing a biological monitoring and adaptive management program that is logistically feasible and scientifically sound is a complicated task that will take many years. This chapter provides a framework, guidelines, and specific recommendations that will help the Implementing Entity develop a detailed monitoring component for their reserve unit management plans. Before each reserve unit management plan monitoring component is developed, basic monitoring will be initiated within the Reserve System. Upon permit approval, the Implementing Entity will compile information from ongoing monitoring efforts conducted by the Permittees throughout the study area.

Monitoring priorities will be guided by the species groupings (described in detail below in Section 7.3.3 *Species-level Actions*). Species have been categorized

into three groups on the basis of listing status and portion of range in the study area. Group 1 includes most of the covered species currently listed as endangered or threatened and covered species for which the study area constitutes a critical portion of the species' range.

Conceptual models will be developed for Group 1 species, and baseline surveys will be initiated for newly acquired parcels. If restoration actions are proposed before the reserve unit management plan is in place, a design plan, including experimental design, monitoring actions and adaptive management will be developed, specific to that action. **Table 7-1** provides a summary of monitoring tasks throughout the Plan permit and beyond. Detailed information of monitoring tasks by program phase is found in Section 7.2.2 *Program Phases*.

It is beyond the scope of this Plan to develop a comprehensive monitoring program at this time. Rather, the goal of this chapter is to provide sufficient guidance to ensure that the monitoring program designed during implementation will meet regulatory standards. Because the location and condition of the Reserve System as well as all target areas for monitoring outside the Reserve System are not known at this time, it would be difficult or impossible to develop detailed monitoring requirements including protocols, thresholds, triggers, and other key variables. Furthermore, some of the components of this monitoring program will be new and will therefore require extensive field testing (see Section 7.2.1 *Types of Monitoring* subheading *Targeted Studies*, below) before they can be implemented on a large scale.

This approach of providing a framework, guidelines, and specific recommendations in the Plan is consistent with the monitoring and adaptive management plans for recent, approved regional HCPs and NCCPs including the Western Riverside County Multi-Species Conservation Plan (an HCP/NCCP), Coachella Valley HCP/NCCP, and East Contra Costa County HCP/NCCP. In earlier plans (e.g., the San Diego County Multi-Species Conservation Plan) that promulgated extensive details of the monitoring protocols and standards, it was found early in implementation that many of the protocols were infeasible or did not produce the right data to evaluate Plan success (B. Johnson pers. comm.).

The scope of the monitoring and adaptive management program is limited by the assurances provided by the Wildlife Agencies to the Permittees and described in Chapter 10. These assurances include the commitment by the Wildlife Agencies that if unforeseen circumstances arise (as defined in Chapter 10), the Permittees will not be required to provide additional land, water, or financial compensation beyond the obligations of the HCP/NCCP.

Despite the assurances provided by the Wildlife Agencies, the monitoring program is designed to be flexible. Because the Plan seeks to balance the requirements of management with the need to learn more about the ecological system through monitoring, the amount of funding allocated to monitoring can vary during the permit term. Funding can be shifted within the Plan at the discretion of the Implementing Entity to respond to the changing needs of the monitoring and adaptive management program. The scope of the monitoring and adaptive management program is further defined below.

## Geography

The geographic scope of the monitoring and adaptive management program will be determined by the lands acquired and/or managed for the Reserve System and the streams managed for the conservation benefit of covered species as described in Chapter 5. Because lands for the Reserve System will be assembled over the course of the permit, the exact configuration of the Reserve System is unknown. However, the general locations of acquisition priorities have been defined (**Figure 5-8**). As the Reserve System grows, the monitoring program will also grow. Monitoring of streams and select covered species<sup>3</sup> will occur within and outside the geographic border of the Reserve System. The regional and global context of species and natural communities will be considered when designing and implementing monitoring and adaptive management.

## Levels

Because the conservation strategy functions at multiple levels, the monitoring and adaptive management program must collect information at these multiple levels. The program described in this chapter details the framework for a three-tiered approach that consists of landscape-, natural community-, and species-level monitoring.

Landscape-level monitoring is designed to detect large-scale changes, such as changes in ecosystem processes, shifts in natural community distribution, and the integrity of landscape linkages. Community-level monitoring is designed to detect changes in the composition and function of natural communities, populations of key predator or prey populations, invasive species, and other important habitat factors for covered species. Species-level monitoring measures the effects of management actions on covered species and tracks the abundance, distribution, and other variables of covered species in the Reserve System and the study area. Additional detail on monitoring over these three levels is provided in **Appendix J Monitoring Issues and Tools**.

## Coordination with Other Programs

Monitoring already occurs throughout the study area to varying degrees on public and private lands. Long-term monitoring and scientific experiments are conducted at several sites along Coyote Ridge for Bay checkerspot butterfly and many serpentine plants. The Plan's monitoring program will borrow from these existing programs where appropriate. During the inventory phase, the Implementing Entity will consult with the proponents of these monitoring programs to learn the latest protocols and determine what aspects of their monitoring overlap with the Plan's requirements. There may also be opportunities to conduct joint monitoring efforts to meet the needs of both

---

<sup>3</sup> Burrowing owl and tricolored blackbird. See species-specific monitoring discussion later in this chapter.

projects. Monitoring programs relevant to the Plan are referenced throughout this chapter, as appropriate.

The Implementing Entity will also coordinate and share monitoring and other experimental results with other regional restoration and management programs. A well-coordinated and scalable monitoring program design will enable the Implementing Entity and others to measure and evaluate change in resources and threats in individual reserves, across the entire Plan area, and within the ecoregion. Such coordination requires standardization of protocols, sampling design, and training of personnel, as well as integrative data analyses. Some of the programs and organizations with which the Implementing Entity will coordinate are listed below.

- Pacific Gas and Electric Company Bay Area Operations and Maintenance HCP (in progress).
- San Francisco Public Utilities Commission Alameda Watershed HCP (in progress).
- Proposed Three Creeks HCP (in progress).
- Upland Habitat Goals Project (Bay Area-wide).
- East Alameda County Conservation Strategy.
- Stream and biological monitoring conducted by SCVWD.
- Management and monitoring carried out by the Santa Clara County Parks.
- Bird monitoring conducted by the San Francisco Bay Bird Observatory in Santa Clara County.
- Other species monitoring conducted by local organizations such as the Burrowing Owl Consortium, California Native Plant Society, and local Audubon chapters.
- Post-fire recovery monitoring conducted at Henry W. Coe State Park (beginning in 2008).
- Management and monitoring programs conducted by adjacent land management agencies such as the Midpeninsula Regional Open Space District, Peninsula Open Space Trust, East Bay Regional Park District, Don Edwards San Francisco Bay National Wildlife Refuge, California State Parks in Santa Cruz County, and others.
- Long-term monitoring along Coyote Ridge for Bay checkerspot butterfly populations and several covered plant species.
- Future recovery planning efforts by CDFG and USFWS.

In addition, the proposed Three Creeks HCP monitoring and adaptive management program is being developed and will coordinate with the Habitat Plan regarding monitoring tasks for covered species common to the two plans. SCVWD will be responsible for the monitoring identified within the Three Creeks HCP and will coordinate its efforts with the Habitat Plan. The Implementing Entity may contract with SCVWD to undertake additional

monitoring related to the obligations of the Habitat Plan. Agreements for monitoring will be sought between SCVWD and the Implementing Entity once the Implementing Entity is established and the permits for both plans are issued.

## 7.1.5 Take Authorization during Monitoring

Some monitoring activities may require handling or disturbing state or federally listed species; such activities constitute take. The monitoring method is optimal when both the quality of information and the impact on the species is assessed. The monitoring program will consider the impact on the species, particularly in cases of very low population numbers. Take of covered species during monitoring activities is authorized providing that all of the following conditions are met.

- The take occurs in association with activities described in the conservation strategy, monitoring chapter, or reserve unit management plan approved by the Wildlife Agencies.
- The take occurs in the permit area, during the permit term, for activities conducted by the Permittees, the Implementing Entity, or any person acting under the direct guidance or authority of these entities.
- The person(s) undertaking such activities is qualified to do so and can carry out their duties in conformance with the protocols and procedures specified in the monitoring chapter and the reserve unit management plan (see Section 6.8.5 *Item 5: Results of Applicable Species Surveys and Monitoring* subheading *Qualified Biologists*).
- The activity is consistent with the Plan's monitoring and adaptive management program.

In order to meet federal and state requirements, the amount and extent of take must be reported in accordance with the permits. The occurrence of all special status species within the Reserve System will be reported to the CNDDDB.

Simple surveys, such as habitat assessments, that would not result in take will likely be conducted by the biologists within the Implementing Entity. However, more complex biological field work, (e.g., kit-fox surveys, burrowing owl exclusions) may result in take and therefore must be carried out by a "qualified" biologist as defined in Section 6.8.5 *Item 5: Results of Applicable Species Surveys and Monitoring*.

## 7.2 Overview

### 7.2.1 Types of Monitoring

Recent guidance for regional conservation planning defines monitoring as the "systematic and usually repetitive collection of information typically used to

track the status of a variable or system” (Atkinson et al. 2004). Because this Plan monitors resources at three levels, many different variables are tracked. In addition to the levels of scale (i.e., landscape, community, and species), three main types of monitoring are specified: compliance monitoring, effectiveness monitoring, and targeted studies. A description of each of these types is provided below.

## Compliance Monitoring

Compliance monitoring tracks the status of Plan implementation and documents that all requirements of the Plan are being met. Compliance monitoring verifies that the permittees are carrying out the terms of the HCP/NCCP, permits, and Implementation Agreement. It is also known as implementation monitoring. The Implementing Entity will track and ensure compliance monitoring internally and provide results to the Wildlife Agencies who will ensure that the Permittees remain in compliance with the permits, IA, and Plan. As defined by this Plan, compliance monitoring will comprise the components listed below.

- Tracking impacts on land cover types (**Tables 4-2 and 4-3**) and covered species modeled habitat (**Table 4-4**) to ensure impact limits are not exceeded and to ensure compliance with the Stay-Ahead requirements. This includes the time commitments for restoration/creation not tied to impacts (see **Table 5-14**) and time commitments for other conservation actions (see Chapter 5).
- Tracking the loss of occurrences of covered plants to ensure that impacts do not exceed the level authorized under permits (see **Table 4-6** for impact limits) and ensuring that equivalent or healthier plant occurrences are protected in the Reserve System (see Chapter 5).
- Tracking impacts to critical habitat for the bay checkerspot butterfly, California tiger salamander, and California red-legged frog (**Table 4-9**).
- Tracking habitat enhancement, restoration, and creation actions (**Tables 5-13, 5-16, and 5-21**).
- Tracking implementation of acquisition requirements (**Tables 5-11, 5-13, 5-16, 5-19, and 5-21**).
- Tracking implementation of management agreements for western burrowing owl nesting habitat (number of acres under management).
- Tracking implementation of other conservation actions on and off the Reserve System.
- Tracking implementation of avoidance and minimization requirements (see Chapter 6).
- Tracking and reporting of management and monitoring activities (Atkinson et al. 2004).

## Effectiveness Monitoring

Effectiveness monitoring assesses the biological success of the Plan—specifically, it evaluates the implementation and success of the conservation strategy described in Chapter 5. Effectiveness monitoring includes monitoring the effects of management activities. An important component of this monitoring is determining patterns within the Reserve System relative to the baseline status and trends of biological resources. The Implementing Entity will design, conduct and report on the results of effectiveness monitoring. Wildlife Agencies, Science advisors and an Independent Conservation Assessment Team will have an opportunity to provide input on and evaluate the proposed effectiveness monitoring and its results (see Section 7.2.3 *Program Implementation*). Both status and trends monitoring and effects monitoring are described below.

### Status and Trends

Indicators of the status and trends of biological resources are monitored to provide baseline data regarding the increase or decrease of these resources in the study area. Baseline data provides a temporal snapshot of the status of natural resources at the first year of monitoring and is a metric against which to compare future data. Status and trends monitoring will include quantitative data on covered species (population size, distribution), land cover, and modeled habitat as well as nonnative invasive species and other known threats. Additionally, historical data on population size or distribution can be relevant to understanding the current condition. For species or natural communities that go through natural fluctuations or variations, historical trends are more important than single year surveys. Qualitative assessments of vegetative structure and/or habitat quality will also be a component of status and trends monitoring. Examples of status and trends monitoring include quantitative data on covered species numbers, acres of land cover types in the study area, occurrences of invasive plant populations, and incidences of natural disturbance (e.g., fire, flood).

### Effects of Management

Understanding the effects of management actions is a critical component of the monitoring and adaptive management program. The purpose of effects monitoring is to ascertain the success of management in achieving desired outcomes, to provide information and mechanisms for altering management if necessary, and to evaluate whether the conservation strategy described in Chapter 5 was successful.

The preliminary or initial component of effects monitoring will include the development and assessment of success criteria for management actions such as stream restoration, pond creation, and butterfly relocation. Where they exist, the biological goals and objectives will determine the form that success criteria take. Once success criteria are developed, effects monitoring will include monitoring these criteria as well as assessing the effects of management on covered species.

Finally, the effects of threat-abatement activities (e.g., density of nonnative invasive plants) will be evaluated (Atkinson et al. 2004).

To determine the effects of management, management actions will be conducted using an experimental approach when feasible (**Figure 7-3**).

## Targeted Studies

Targeted studies fulfill three major objectives:

1. Identify the best methodologies for monitoring;
2. Provide information about the efficacy of management techniques; and
3. Resolve critical uncertainties allowing for improved management of systems and species.

For the purposes of this Plan, targeted studies that provide information regarding monitoring protocols are called *methods testing*. Targeted studies that provide information regarding the effects of management actions are called *pilot projects*. Targeted studies that address critical uncertainties are called *directed studies*. Methods testing and pilot projects will be conducted by the Implementing Entity or its contractors. Directed Studies could be carried out or funded by the Implementing Entity. However, the Implementing Entity may also utilize graduate students, University researchers, or other scientists whose project goals inform critical uncertainties and further the biological goals and objectives of the Plan. In addition, directed studies may be funded by outside sources if the work carried out on Reserve Lands furthers the Implementing Entity's understanding of covered species and natural communities.

## Method Testing

Method testing is designed to evaluate alternative monitoring protocols and sampling designs and to select the best technique for obtaining information. For example, if the objective is to quantify wildlife use of a corridor crossing, methods testing might compare the use of tracking plates, bait stations, and trail cameras. The results of method testing would then be used to develop a long-term monitoring protocol.

## Pilot Projects

Pilot projects will be used during implementation to ascertain, on a small scale, which management actions may ultimately yield the desired conservation gains prior to initiating a long-term project. Pilot projects are also a cost-effective way to test management actions. Pilot projects can and should be used during the early phases of Plan implementation to field test different management actions (see **Figure 7-3** for a continuum of experimental management).

## Directed Studies

The term *critical uncertainties* refers to key questions that shape how the ecological system is actively managed. Because natural systems are extremely complex and dynamic, varying degrees of uncertainty are associated with conserving and managing these systems. Typically, management proceeds absent a full understanding of the components that affect a natural community or a species. The outcome of these management actions are carefully monitored and refined in acknowledgement of the high level of uncertainty. Directed studies are used to reduce the levels of uncertainty related to achieving biological goals and objectives. These uncertainties are generally related to the factors listed below:

- The ecological requirements of covered species, and
- The likely response of covered species and natural communities to implementation of conservation actions within the Reserve System.

All of the conservation actions identified as “STUDIES” in **Tables 5-2a–b** are considered directed studies. The Implementing Entity may propose additional directed studies not identified as conservation actions. Directed studies will be carried out to gain insights into key questions identified in the conservation strategy and during Plan implementation. All proposed directed studies will be prioritized during implementation and will be carried out based on their priority ranking. Directed studies identified in **Table 5-2b** will be prioritized and funded as part of conservation strategy implementation.

Results of directed studies conducted under the Plan will inform management and ensure attainment of the biological goals and objectives. It is expected that some or all of the directed studies specifically outlined in the conservation strategy will be conducted by the Implementing Entity or consulting scientists. Additional long-term directed studies, identified during Plan implementation, will be conducted by or in partnership with outside scientists from academic institutions, consulting firms, and nonprofit organizations. It is anticipated that funding provided by the Implementing Entity for directed studies could be matched or supplemented by other entities to increase the level of investigation and to achieve results that integrate with broader issues in the scientific community. In addition to the directed studies undertaken to answer critical uncertainties, it is expected that the Implementing Entity will develop partnerships with academic institutions (e.g., undergraduate student projects, Masters theses, Ph.D. dissertations) to help address broader scientific interests within the Reserve System that will nonetheless inform and improve management and monitoring techniques. Funding for this and other programs is described in more detail in Chapter 9 *Costs and Funding*.

## 7.2.2 Program Phases

The essential elements of the monitoring and adaptive management program have been organized into three main phases: inventory, targeted studies, and long-term monitoring and adaptive management.

Key tasks in each phase are described in below. In general, activities in the inventory phase will occur during the first 5 years of Plan implementation and thereafter as parcels are added to the Reserve System. For individual sites, the inventory phase will begin immediately after land acquisition. Most targeted studies will be concentrated in the first 5 years of Plan implementation, but they will likely continue throughout implementation as management uncertainties are identified and resolved. Activities in the long-term monitoring phase will begin on each site after the inventory phase is complete. Because the Reserve System is being created over several decades there will likely be extensive overlap between activities in each phase during the first 10–20 years of Plan implementation (**Figure 7-1**). Also, see **Table 7-1** for a summary of monitoring tasks throughout the permit term.

### Inventory Phase

The initial inventory phase of monitoring occurs following permit approval and continues as new parcels are acquired and added to the Reserve System or new conservation actions are initiated outside the Reserve System, primarily on streams. Baseline information collected during the inventory phase will lay the foundation of the overarching monitoring and adaptive management program. Inventories will need to occur over multiple seasons to ensure that all species present are identified. If a parcel is acquired in a drought, it may take several years for certain plants to appear, for example. Under normal conditions, the initial inventory will take place within 3 years of acquisitions for each site. The Implementing Entity will inventory and assess landscapes, natural communities, and species, as appropriate, within the Reserve System. This information will build largely on the data collected during pre-acquisition assessments and will be supplemented by post-acquisition monitoring.

In addition to the acquisition of baseline information, the inventory phase will focus on the identification of key relationships between species, habitats, and processes; the prioritization of project implementation; the refinement of species groups; and the selection of biotic and abiotic indicators for evaluating ecosystem condition. Information collected during the inventory phase will build on species information (**Appendix D**) as well as other data sources (e.g., historical ecology reports).

### Document Baseline Conditions

Baseline conditions within the Reserve System need to be documented to enable management planning and to serve as a comparison point for all future

monitoring. Accordingly, resources of interest that occur on a site need to be documented, mapped and, if required to measure compliance with biological goals and objectives, censused. Also, baseline surveys and post-construction monitoring will take place in areas where activities may impact a covered plant occurrence. Documenting baseline conditions will consist of the following tasks.

- Update GIS land cover layer with aerial photographs, satellite imagery, and other relevant data sources including serpentine soils maps at the outset of implementation.
- Inventory and document resources and improve mapping as the Reserve System is assembled. The results of the assessments for land acquisition (i.e., pre-acquisition assessment; see Chapters 5 and 8) will be the first source of baseline data. Data-collection methodologies and nomenclature will be standardized to facilitate sharing of information.
- Conduct baseline surveys for plants in areas where covered activities may impact plant occurrences (Condition 20).
- Research and document historical data and trends, as appropriate.
- Use baseline data to validate and refine species habitat models as lands are surveyed and acquired (species models will be updated periodically, but no less frequent than every 5 years, consistent with new survey data collected from the Implementing Entity, from land cover mapping provided by project applicants, and from other relevant sources).
- Conduct post-acquisition biological inventories. Additional surveys will be needed to supplement data gathered in pre-acquisition assessments.
- Conduct post-construction surveys for covered plants in areas where covered activities may have impacted occurrences of covered plants (Condition 20).
- Use aerial photos and ground surveys, as needed, to assess quality and location of local and regional landscape linkages between unprotected natural areas and adjacent protected lands.
- Collect additional baseline data needed to refine conceptual models (see **Appendix J**, Section J.2.2 *Natural Community Monitoring Tools* and **Figures 7-6 through 7-9**).

## Initiate Management Planning

Management planning will consist of the following tasks.

- Prioritize implementation of conservation actions to best achieve biological objectives.
- Develop reserve unit management plans (described in Chapter 5, Section 5.2.5 *Land Management*).
- Confirm species monitoring groups and refine the monitoring schedule.
- Identify biotic and abiotic indicators (see section on indicators for description) for testing during the targeted studies phase.

- Select monitoring protocols and identify sampling design for status and trends and effects monitoring. Test experimental designs during the targeted studies phase, as necessary.
- Develop criteria for measuring success of enhancement, restoration, and creation efforts (see example criteria in **Table 7-2**).
- Develop criteria to assess effectiveness of conditions on covered activities (described in Chapter 6 *Conditions on Covered Activities and Application Process*).

Upon implementation of the Plan, the Implementing Entity will document baseline conditions along with survey methods and monitoring schedules based on the guidelines for monitoring described below. Some species have boom/bust population dynamics that are highly dependent upon weather (e.g., Bay checkerspot butterfly and some of the covered plants). Survey protocols and the success criteria developed will account for this. These protocols and schedules will provide the overarching framework that will be implemented in each management unit. The Implementing Entity will draw from relevant and established protocols (e.g., Wildlife Agency and CNPS survey protocols) and will adapt them throughout the permit term to incorporate the best available scientific data.

A monitoring component will be developed for each reserve unit management plan that identifies protocols, indicators, monitoring schedule, and success criteria. This component will be revised to include information from methods testing, pilot projects and directed studies as results become available. Before the reserve unit management plan for a given reserve is complete, monitoring on lands in the Reserve System will consist of baseline inventories, pilot projects to test monitoring methods, and directed studies.

## Targeted Studies Phase

The targeted studies phase of monitoring also follows permit approval and will continue as long as critical uncertainties persist (**Figure 7-1**). However, most targeted studies will take place within the first 5–10 years of Plan implementation such that results can inform long-term management. The Implementing Entity will develop conceptual models for key natural communities (see **Figure 7-8**) and covered species (see **Figure 7-9**) that identify critical management uncertainties; design and initiate pilot projects to test management and monitoring methods; develop and initiate experiments that resolve critical uncertainties; and begin pretreatment monitoring of sites considered for enhancement, restoration, or creation.

## Develop Ecological Models

Management-oriented conceptual ecological models will be a cornerstone of the monitoring program and will be created during the initial years of

implementation. These models will inform the monitoring program by identifying relationships between ecosystem components and by identifying management assumptions. As the monitoring program collects additional data, these “living” models will serve as a framework for management decisions and will function as reference points for the Implementing Entity’s understanding of the relationship between management and natural communities and/or covered species within the Reserve System. In addition, species conceptual models that identify threats, management and monitoring for species will be developed. A full description of conceptual ecological models and species conceptual models is found in **Appendix J**, Sections J.2.2 *Natural Community Monitoring Tools* and J.3.1 *Species-Specific Monitoring Tools* respectively.

## Test and Refine Monitoring Protocols

In the targeted studies phase, the Implementing Entity will conduct methods testing (described above) to develop, test, and refine monitoring protocols. Monitoring protocols will be developed for landscapes, natural communities, species groups, and individual covered species. The purpose of this testing is to identify the best and most cost-effective monitoring methodologies to derive the desired information. For example, one of the biological objectives of the conservation strategy is to increase the permeability of certain barriers, such as highways, in the study areas. Monitoring will need to assess wildlife movement in target areas. The targeted studies phase will test methods (e.g., camera traps, track plates, use of bait) to determine the desired protocols for long-term monitoring. Monitoring protocols will be conducted in a repeatable manner and will provide both quantitative and qualitative data to inform management design within the Reserve System.

In some cases there is little distinction between pilot projects and long-term monitoring. During the targeted studies phase, different management techniques will be implemented and evaluated experimentally. In some cases, restoration, enhancement, and monitoring methods are not known or have not been successfully reproduced on a large scale by land managers or the scientific community. Before restoration or enhancement through management can occur successfully, these methodologies need to be tested on a smaller scale. These pilot projects, designed to test the effectiveness of restoration and enhancement, are necessarily long-term (i.e., 5–15 year) endeavors; they will inform long-term management but will also be included as part of the long-term management program. Results from these early studies will guide future efforts in the Reserve System. This feedback will increase the efficiency with which reserve lands can be managed and the overall success rate of management activities. For example, a study published in 2004 evaluated the effectiveness of methodologies for restoring riparian vegetation (Opperman and Merelender 2004). Similar pilot projects will be developed in the targeted studies phase when multiple techniques are intended to achieve a desired outcome and are appropriate for monitoring habitat function within the Reserve System and overall study area.

Testing the use of indicators for natural communities or covered species; refining monitoring protocols; establishing control plots for long-term management; and

reviewing the literature for guidance on sampling, experimental design, and management will all be a part of the targeted studies phase of implementation.

## Develop Experiments to Resolve Critical Uncertainties

A final element of the targeted studies phase of implementation is the development of experiments that resolve critical uncertainties. In some cases, critical uncertainties will be identified as conceptual models are developed (see **Appendix J**, Section J.2.2, *Natural Community Monitoring Tools*, **Appendix J**, Section J.3.1, *Species-Specific Monitoring Tools*, and **Figures 7-6 through 7-9**). In other cases, critical uncertainties have been identified and described as part of the biological objectives of the Plan (see especially the Directed Studies section of **Table 5-2b**). For example, in order to enhance the chaparral land cover types, the critical uncertainty of factors contributing to the health and regeneration of native chaparral species must be resolved. The targeted studies phase of implementation will entail initiation of projects that resolve the critical uncertainties identified in the Directed Studies section of **Table 5-2b** as well as any other critical uncertainties identified as the conceptual models are developed.

In addition, the Implementing Entity will work with other individuals and organizations (e.g., local universities) to facilitate targeted studies on the Reserve System and streams that will improve management.

## Long-Term Monitoring and Adaptive Management Phase

Both the inventory phase and the targeted studies phase will be followed by long-term monitoring to determine the status and trends of landscapes, natural communities, and species and the effectiveness of the management of the Reserve System in achieving the biological goals of the Plan (**Figure 7-1**). Monitoring that does not depend on the results of targeted studies will occur as soon as the reserve unit management plans have been reviewed and approved by the Wildlife Agencies and baseline studies are complete (inventory phase) or sooner, if appropriate. Long-term monitoring will use the framework developed during the inventory phases to carry out effectiveness monitoring and to implement adaptive management.

The long-term monitoring phase includes the following tasks.

- Update GIS land cover layer with aerial photographs, satellite imagery, and other relevant data sources including serpentine soils at least every 5 years. Assess status and trends at the landscape and natural community levels.
- Monitor species (covered species or indicator species) response to enhancement, restoration, and habitat creation.

- Monitor restoration sites for success; remediate sites if initial success criteria are not being met. The reserve unit management plan will identify triggers for remediation, if necessary.
- Monitor covered species using methodologies developed in targeted studies phase. Assess status and trends of covered species by monitoring covered species populations, groups, or guilds of species or indicators over time.
- Assess status and trends of covered plants that may have been partially or temporarily impacted by covered activities to ensure that plant protection in the Reserve System adequately offsets impacts.
- When enhancement and restoration projects are complete and have met final success criteria, scale back monitoring effort (i.e., frequency, extent) but continue to adaptively manage these sites<sup>4</sup>.
- Update **Figure 2-5 Private Development Areas Subject to the Plan** based on best available science throughout implementation to ensure projects in specific portions of the permit area are required to go through the Plan are appropriately identified. Revisions to the map will be tracked in the annual report.

In addition to long-term monitoring, this phase will include steps to adaptively manage the Reserve System to implement the conservation strategy described in Chapter 5. Adaptive management tasks are listed below.

- **Evaluate efficacy of monitoring protocols.** During this phase, the results of pilot projects will be evaluated and incorporated into long-term monitoring efforts.
- **Incorporate best available scientific information into management.** Regular reviews of literature as well as interaction with the Science advisors and the Wildlife Agencies will ensure that new understanding of the species or monitoring approaches is incorporated into the monitoring and adaptive management program.
- **Evaluate and refine conceptual models.** Conceptual models will be developed for each species and for natural communities (see **Appendix J, Section J.2.2 Natural Community Monitoring Tools**, **Appendix J, Section J.3.1 Species-Specific Monitoring Tools**, and **Figures 7-6 through 7-9**). In addition, the existing species habitat models developed for this Plan will be refined. As more information becomes available and as assumptions evolve, the models will reflect changes and continue to provide guidance for future monitoring efforts.
- **Review any unexpected or unfavorable results and test hypotheses to achieve desired outcome.** Unexpected results or results suggesting that the conservation actions will not likely meet the conservation strategy commitments described in Chapter 5 of the Plan will be probed to understand

---

<sup>4</sup> Frequencies of monitoring will be dependent on the natural community or species and will be determined during the development of the reserve unit management plans. In some cases, monitoring will be conducted on an annual basis, in other cases, monitoring may only be necessary every 3–5 years.

the cause or source of the result. Hypotheses about management outcomes will be tested.

- **Adjust management actions and monitor.**
- **Adjust success criteria and conservation actions, if necessary.** The success criteria and conservation actions developed for the Plan will be adjusted if they have been determined to be inappropriate indicators of success (too high or too low, based on biological information), if more cost-efficient but equally successful conservation actions are developed and agreed upon by the Wildlife Agencies, or if they are inadequately conserving species or communities. The magnitude of the change to the success criteria will be based on best available scientific information. New or different conservation actions may be implemented through time, as long as they fulfill the conservation strategy commitments described in Chapter 5 of this Plan. Conservation actions are catalogued in **Tables 5-1a–d and 5-2a–b** and are described in more detail in Section 7.3, *Monitoring and Management Actions*, below. Example success criteria are described in **Table 7-2**. Operational success criteria will be developed during the Targeted Studies phase of implementation. Changes to success criteria and conservation actions will be discussed with and not implemented until approved by the Wildlife Agencies. For significant changes, a permit amendment may be necessary.

## 7.2.3 Program Implementation

### Program Infrastructure

As described above, adaptive management is a critical element of the Plan because it addresses many of the uncertainties of the Plan and provides for continual adjustment and improvement toward meeting Plan goals and objectives. Key to the success of the adaptive management program is a clear and effective structure for making decisions on the basis of new data from Plan monitoring and information from other sources. The Implementing Entity will be advised by five groups that play an important role in adaptive management:

- Wildlife Agencies,
- Other land management agencies (or a Technical Advisory Committee),
- Science advisors,
- Independent Conservation Assessment Team, and the
- Public.

As a preliminary planning step to coordination, the Implementing Entity will inventory monitoring projects and programs in the study area, their goals, timelines, design, protocols, etc. This will help coordinate information and will be an important first step in developing the monitoring component of the reserve

unit management plans. The Implementing Entity's responsibilities for executing the adaptive management program are listed below.

- Designing and implementing a scientifically robust effectiveness monitoring program (described above).
- Gathering monitoring and research data, including relevant information developed by others, and maintaining databases.
- Disseminating monitoring and research data generated by the Habitat Plan, including monitoring reports, conference presentations, and published papers to others.
- Assessing the effectiveness of conservation measures relative to the conservation strategy described in Chapter 5.
- Identifying the need to modify existing or to adopt additional conservation measures and defining what to change and how to change it.
- Identifying the need to modify the monitoring program and defining what to change and how to change it.
- Identifying the need for and implementing experimental pilot projects.
- Identifying and prioritizing targeted studies and conducting studies that inform critical uncertainties.
- Developing and updating the monitoring and adaptive management elements of reserve unit management plans.
- Incorporating monitoring, directed studies, and other adaptive management-related activities into reserve unit management plans.
- Creating and maintaining a network of science advisors (see below) to provide advice to the Implementing Entity, as needed, on adaptive management and monitoring issues including important data gaps, monitoring and management methods, and data interpretation.
- Periodically (at least every 5 years) convening the Independent Conservation Assessment Team (Section 7.2.3 *Program Implementation*) to conduct a program-wide review of Habitat Plan implementation, including monitoring and adaptive management, and providing recommendations to improve Habitat Plan implementation.
- In Year 20 of implementation, work with the Wildlife Agencies to conduct a formal and complete review of progress toward building the Reserve System.

The Implementing Entity will solicit input regarding adaptive management from the Wildlife Agencies, science advisors, Independent Conservation Assessment Team, other independent experts, and the public. In addition, the Implementing Entity may convene technical committees to seek focused advice on key adaptive management topics. The responsibility for which course of action to take in adaptive management rests with the Implementing Entity and its senior staff or senior contract biologists. However, the Wildlife Agencies will assist the Implementing Entity with the adaptive management program. Major shifts in the adaptive management program need to be reviewed and approved by the Wildlife

Agencies. Major shifts include, but are not limited to, proposed actions that may be inconsistent with the Plan or detrimental to a covered species, introducing new and untested management techniques, discontinuing and replacing ineffective management techniques that are recommended in the conservation strategy, or applying management techniques on a much larger or smaller scale than envisioned in the Plan. Decisions made in the adaptive management program will be based primarily on which course of action is most likely to meet the conservation strategy described in Chapter 5.

## Wildlife Agencies

A primary role of the Wildlife Agencies is to provide feedback to the Implementing Entity regarding changes to Plan implementation based on the results of targeted studies and monitoring and on the recommendations of the science advisors, the Independent Conservation Assessment Team, academic scientist partners, and others. Where possible, Wildlife Agency staff will provide expertise in the biology and conservation of covered species and natural communities, management tools, monitoring program, and all other Plan implementation.

The Implementing Entity and the Wildlife Agencies will strive at all times to work in good faith with each other to reach mutual agreement on key implementation tasks such as adaptive management, monitoring, and conservation actions. The primary forum in which these discussions will occur is the Technical Advisory Committee described in Chapter 8, Section 8.2.4 *Technical Advisory Committee*. Additional meetings with the Wildlife Agencies may be needed to discuss and resolve key issues related to adaptive management and monitoring. If disagreements arise that cannot be resolved easily, the Implementing Entity will follow the “meet and confer” dispute resolution process outlined in Section 6.6.1 of the Implementing Agreement, and if necessary, the “elevation of dispute” process outlined in Section 6.6.3 of the Implementing Agreement (**Appendix B**).

## Land Management Agencies

As discussed above, the Implementing Entity will share information and resources in implementing management across reserve boundaries and on a regional scale with other land management agencies in the study (e.g., County Parks, State Parks, and the Open Space Authority). Input from other land management agencies in the study area is an important component of successful adaptive management. Land management agencies that manage land on behalf of the Implementing Entity (i.e., as part of the Reserve System) will form a Technical Advisory Committee to coordinate management and ensure consistency across the Reserve System.

## Science Advisors

The Implementing Entity will consult science advisors who will provide regular advice on Plan implementation. The role of the science advisors is to provide the Implementing Entity with science-based expert opinion and recommendations, focused “white papers,” peer review, and feedback regarding key scientific aspects of Plan implementation such as reserve assembly, reserve management, and monitoring protocols. Science advisors will be contacted by the Implementing Entity and its partners, including the Wildlife Agencies, as needed. They may also be convened as a group when needed to address specific topics. Science advisors will be scientists and resource managers with expertise in one or more of the following areas:

- Covered species,
- Landscape ecology,
- Natural communities in the Reserve System,
- Ecological processes,
- Resource management,
- Biological monitoring,
- Statistical analysis and experimental design.
- Conceptual models,
- Species-specific surveys, and
- Species protocols.

Science advisors will be selected by the Implementing Entity with input from the Wildlife Agencies. The Implementing Entity may also request that the science advisors review the following types of information prepared by or for the Implementing Entity.

- Proposals for directed studies to address important management questions.
- Management and monitoring reports and recommendations to the Implementing Entity provided by others.
- Monitoring priorities, sampling design, survey protocols, data analysis, and data storage.
- Proposals for experimental pilot projects to test natural community enhancement/creation/restoration or management techniques.
- Proposed changes in reserve design and management, natural community enhancement/restoration/creation techniques, alternative conservation measures, and monitoring methods, based on interpretation of monitoring or research results and consistent with the protocols for, and limitations on, the Adaptive Management Program.

## Independent Conservation Assessment Team

The Independent Conservation Assessment Team will be composed of highly qualified scientists and resource managers who are independent of the Habitat Plan and the science advisors. Selecting members who are independent of the Plan is important to ensure an unbiased assessment of Plan implementation. The role of the Independent Conservation Assessment Team is to provide periodic review of overall Habitat Plan implementation, including the following specific areas:

- Assembly of the Reserve System and the progress of habitat restoration efforts;
- The appropriateness of the monitoring and management methods being used to achieve Plan goals, including indicators and success criteria;
- The appropriateness of the interpretation of monitoring data; and
- Changes that may be needed in conservation, management, or monitoring to better achieve Plan goals.

The Independent Conservation Assessment Team will provide policy-level recommendations to the Implementing Entity. The Independent Conservation Assessment Team will be selected and convened by the Implementing Entity at least every 5 years as part of the 5-year major Plan review. The Wildlife Agencies will be consulted regarding prospective members. A 5-year interval will allow progress to be made toward Plan compliance and biological goals and objectives, as well as the collection of monitoring data sufficient to support a thorough and meaningful progress review. It is expected that the composition of the Board will change each period, although some consistency in membership is preferred. It is also expected that the scope of review of the Independent Conservation Assessment Team will vary each time they are convened. For example, the first time they meet their review will likely focus on the initial phases of implementation and early monitoring results and protocols. Later reviews will focus on more extensive monitoring data and results.

## The Public

Members of the public will have opportunities to learn about Plan status and provide input to the Implementing Entity on adaptive management during periodic (at least annual) public hearings and regular meetings of the public advisory committee, which will be open to the public. Members of the public may offer important contributions to a successful adaptive management program, such as providing data on covered species, critical reviews of monitoring data, and suggestions for improved land management. Members of the public may also participate in data collection through a volunteer program supervised by the Implementing Entity or its designee.

## 7.2.4 Guidelines for Monitoring

Because the biological outcome of many management actions is uncertain, the monitoring and adaptive management program is based on scientific principles that guide continual refinement of conservation efforts in order to implement the conservation strategy described in Chapter 5. The adaptive management program will develop alternative management strategies and test the effectiveness of those strategies in the Reserve System. To that end, there is a continuum of management actions that incorporate scientific principles of adaptive management to varying degrees (**Figure 7-1**). The most basic monitoring involves simply assessing effects once a management action has occurred without any replication, controls, or comparison of management treatments. At the other end of the spectrum are directed studies that test a hypothesis in a manner that can be validated through statistical inference. Even simple experimental methods will yield important results to help guide and improve management. The scientific principles listed below will guide monitoring and adaptive management.

- Adaptive management actions will incorporate scientific principles of replication, control, and pre- and post-treatment monitoring when necessary to accurately measure the Plan's implementation of the conservation strategy. Targeted studies will refine monitoring protocols and resolve key management uncertainties.
- Adaptive management and monitoring actions will be linked to hypotheses about species' ecological relationships and responses to management actions. Monitoring will be designed in such a way as to test these hypotheses.
- When feasible, adaptive management or directed studies will include an experimental design with appropriate significance levels (alpha level) as well as sufficient statistical power to detect effects (beta level).

Adaptive management, and the design of targeted studies, will be driven by hypotheses about key factors for the landscape, natural community, and/or species for which the management is applied. For example, if the goal of management is to increase populations of small mammals to serve as a prey base for certain covered species (e.g., western burrowing owl, San Joaquin kit fox), land managers must develop hypotheses about what controls small mammal abundance and distribution. Adaptive management actions and monitoring will be directed toward confirming or disproving those hypotheses. Directed studies will be conducted on a small scale using an experimental design that will yield statistically valid results to address critical uncertainties. Ultimately, if small mammal availability limits the abundance of covered species, increasing the prey base may increase the survival and fitness of covered species. If the prey base increases and the covered species do not respond, then other factors apparently limit their abundance.

In addition to the scientific guidelines described above, the following steps will be included in the experimental design.

1. **Define the question.** Monitoring strategies will be designed to address specific hypotheses. Conceptual, statistical, or spatially explicit models will define those hypotheses. Conceptual models are described in **Appendix J**, Sections J.2.2 *Natural Community Monitoring Tools* and J.3.1 *Species-Specific Monitoring Tools*.
2. **Determine what to measure.** Establish the attributes or variables that the monitoring will measure to answer the question defined above. This step includes the development of measurable success criteria for evaluating creation, restoration and enhancement actions.
3. **Develop monitoring protocols.** Questions to be answered by the monitoring program will be at the species, natural community, and landscape level. Monitoring protocols will vary with level and with the target of the monitoring. Monitoring protocols will be developed in accordance with the guidelines provided below in Section 7.2.4 *Guidelines for Monitoring* subheading *Protocols*.
4. **Use indicator species, if appropriate.** In some cases, groups of species or indicator species will streamline monitoring. Indicators are selected because they are easy to survey and provide usable information on the species or system in question. Guidelines for selecting and using indicators are described in detail below.
5. **Consider sampling design.** Sampling design needs to be a consideration prior to initiating the experiment. The experimental management approach of the HCP/NCCP requires that questions of site selection, statistical power, and significance be incorporated, as much as possible, into the monitoring and adaptive management program. Sampling design is described in detail below.

In addition, **Appendix J** *Monitoring Issues and Tools* provides guidance on monitoring challenges relevant to landscape, natural community and species for the study area.

## Indicators

Indicators can be used in many ways: to predict species richness (MacNally and Fleishman 2004), to estimate biodiversity (Kati et al. 2004; Chase et al. 2000), to assess levels of disturbance, or to provide targeted information on a system or species (Caro and O'Doherty 1999; Carignan and Villard 2004). Landres et al. (1988) define an indicator species as

an organism whose characteristics are used as an index of attributes too difficult, inconvenient, or expensive to measure of other species or environmental conditions of interest.

In this Plan indicators will be used, when appropriate, to provide information on covered species and other components that are difficult to survey, and to provide information on natural community or ecosystem function. In some cases indicators will be used to determine the availability of habitat for a species. For

example, the presence of a California ground squirrel colony would be an indicator for available upland habitat for California tiger salamander if there is also breeding habitat within dispersal distance. In that circumstance, the expansion of ground squirrel colonies would then represent an increase in available habitat for California tiger salamanders. Measuring the increase in ground squirrel colony size is much easier than measuring the increase in use by California tiger salamanders. Additionally, when there are complex interactions among biotic and abiotic factors, modeling species responses or using abiotic factors as an indicator may not be appropriate. Monitoring aspects of the target species may be a more reliable and often easier “indicator” than abiotic factors (like temperature, substrate or turbidity). For the purposes of this Plan, indicators are abiotic and biotic variables that are selected to facilitate monitoring of systems or species that are otherwise difficult to examine.

In cases where an indicator is used to monitor an ecosystem or natural community (health indicator species), the conceptual models will be used to help identify an appropriate indicator species or variable. Draft performance indicators for natural community enhancement, restoration, and creation measures are presented in **Table 7-2**. Indicators, in general, are easy to monitor and demonstrate changes or trends that are quantifiable. Indicators need not be species, but may be ecological variables or structure-based characteristics such as diameter and age class of trees, interpatch distances between habitat, or key structural features of certain habitat types (e.g., snags or downed logs in forests, woody debris in rivers) (Noss 1999; Lindenmayer et al. 2000). Effective indicators (or variables) have some or all of the following characteristics (Carignan and Villard 2002; Atkinson et al. 2004).

- They are relevant to program goals and objectives and can be used to assess the program performance at the appropriate spatial and temporal levels.
- They are sensitive to changes in the ecosystem, providing early warning of response to environmental or management impacts.
- They indicate the cause of change, not just the existence of change.
- They provide a continuum of responses to a range of stressors such that the indicator will not quickly reach a minimum or maximum threshold.
- They have known statistical properties, with baseline data, references, or benchmarks available.
- They are technically feasible, easily understood, and cost effective to measure by all personnel involved in the monitoring.

The indicators or variables will be coordinated with existing programs and data sets that are complementary to, and consistent with, the conservation strategy of this Plan. Prior to adopting any indicator, field verification and fine tuning in the system of interest is necessary (Atkinson et al. 2004). Once monitoring variables have been selected, the following descriptions will be made (Atkinson et al. 2004 as adapted from Gibbs et al. 1999 and National Research Council 2000).

- “What” will be monitored.

- “Why” the monitoring is useful (i.e., the specific question the variable is designed to address).
- “When” will the variable be monitored and at what frequency.
- The conceptual ecological model underlying the selection of the monitoring variable.
- The geographical area where it will be monitored (e.g., transect locations, stream miles).
- The specific variable that will be measured and the protocol that will be used.
- The range of values the monitoring can produce and what these would mean.
- The expected response (as in response to management or outside pressures) and the magnitude of change expected.
- The time frame and spatial scale over which change is expected to be demonstrated.

The monitoring component of each reserve unit management plan will clearly present the rationale for using indicators. Indicators must be applicable and appropriate measures of the biological goals and objectives. For example, the monitoring component will specify why monitoring the presence of egg masses for covered amphibians is an appropriate indicator of population-based goals and objectives. In this example, the reserve unit management plans will justify that counting individual adults, larvae, and/or metamorphs is not the only or preferred way of monitoring for population status. The recommendation of the science advisors will also help guide the selection of indicators and the Implementing Entity will work with Wildlife Agencies to develop appropriate indicators. Finally, it is important to consider how the results will be interpreted and how they can be used to create change, if necessary.

## Protocols

When available, scientifically accepted monitoring protocols that are compatible with measuring the success of the conservation strategy of this Plan will be adopted to facilitate data comparison with other studies. Monitoring protocols will be appropriate to the task, accurate, and as cost-effective as possible. Monitoring protocols will be standardized across the entire Reserve System and will be incorporated into all reserve unit management plans. To be successful, the monitoring protocols must be applied consistently by different observers and across monitoring cycles. Ongoing training by Implementing Entity staff or their contractors will be necessary to ensure this consistency. For example, the National Park Service’s Inventory and Monitoring Program guidelines for monitoring protocols (Oakley et al. 2003) or the Bureau of Land Management’s guidelines (Elzinga et al. 1998), in addition to other sources, can be used as references for developing monitoring protocols.

Monitoring protocols will vary by covered species. For species that are difficult to detect in the study area (e.g., San Joaquin kit fox), monitoring may be limited

to determining whether the species persists from sample period to sample period, what features define its habitat, and what threats it faces. Surveys for species that are more readily detectable (e.g., California tiger salamander, California red-legged frog) may detect whether the species' range is increasing or decreasing. For species that are sufficiently detectable to obtain estimations of population size or probability of detection (e.g., western burrowing owl, many covered plants), monitoring a randomly selected subset of the population in order to make statistical inference to the whole population can be achieved through adherence to the principles listed below.

- Develop and state the assumptions in the hypotheses and models *before* collecting monitoring data or conducting manipulations such as experiments and adaptive management.
- When designing an experiment or using adaptive management, select the number and location of sampling units so as to apply sufficient scientific rigor for evaluating the hypothesis being advanced.
- Replicate in space and time the number of the sites surveyed for population estimates and/or those receiving a management action. Use controls when appropriate.
- Measure the sensitivity of variables to reflect true changes in the resource being sampled. When appropriate, adjust counts, measures of species richness, and determinations of patch occupancy (i.e., presence/absence) with an estimate of detection probability as described by Lancia et al. (1996), Yoccoz et al. (2001), and Pollock et al. (2002).

## Sampling Design

Sampling design will vary with the goals and phases of monitoring. During the inventory phase, baseline inventories may require a less rigorous sampling design, relying, for example, on visual surveys for detecting presence or absence. "Rapid Assessment" techniques may also be used. As on-the-ground monitoring progresses, site selection and replication merit increased attention based on the goals of the monitoring at that time.

An important goal in sampling and experimental design is to minimize extraneous variance in the measured values of indicators or variables. Selection of variables will be guided by a thorough knowledge of the ecological relationships that drive natural communities. Sampling intensity and probability of detection will be considered to ensure that all covered species are adequately inventoried and monitored. Recent studies have indicated that monitoring programs that fail to address issues of detectability and spatial variation have drastically overestimated population trends over time (Martin et al. 2007). Prior to implementing simple count-based indices for population trends for covered species, researchers must have confidence that detectability will remain constant over time. Methods of data analysis will be established prior to study design, and a statistician or biologist with sufficient statistical expertise will be consulted. Issues to consider (Scheiner and Gurevitch 1993) are listed below.

- Availability of sites on which treatments can be applied.
- Availability of reference sites.
- The site-selection process (is it random? stratified random? non-random?).
- Systematic versus opportunistic sampling.
- Detection probability of the protocol.
- Replication versus pseudo-replication (Hurlbert 1984).
- The clarity of hypotheses.
- Sufficient statistical power ( $1-\beta$ ) or significance level ( $\alpha$ ).

## 7.3 Monitoring and Management Actions

### 7.3.1 Landscape-Level Actions

Landscape-level monitoring will be directed at tracking large areas, landscape-level processes, and regional issues that affect the study area. **Table 5-1a** correlates landscape-level monitoring actions with biological goals and objectives for landscapes. Landscape-specific issues such as linkages, invasive nonnative plants and animals, disturbance, disease, and hydrology are described in **Appendix J *Monitoring Issues and Tools***. The section below summarizes the specific monitoring actions that the Implementing Entity will carry out to track environmental issues at the landscape level and ensure that landscape-level goals and objectives are being met. Compliance monitoring is described above in Section 7.2.1 *Types of Monitoring* and will take place at all levels of monitoring, including the landscape level.

### Assimilate Results of Pre-Acquisition Assessments and Other Surveys

Information on landscape features will be collected through pre-acquisition assessments, including biological surveys, updated land cover mapping, assessments of habitat suitability for covered species, air photo interpretation, and the biological resources present or expected on site, that provide information on the extent, quality, and distribution of land cover types in the Reserve System. These data will be used to refine existing species habitat models and develop natural community conceptual models (see **Appendix J**, Sections J.2.2 *Natural Community Monitoring Tools* and J.3.1 *Species-Specific Monitoring Tools*, and **Figures 7-6 through 7-9**). Additionally, this information will be combined with landscape-level information being collected by others in the region to provide resource managers, including the Implementing Entity, with an understanding of how critical biological resources are generally trending under the influence of Plan implementation as well as under the influence of other human activities and other environmental factors (e.g., fire, drought, disease). Annual information on

precipitation and whether the study area is experiencing a wet or dry water year will also be collected to facilitate trends analysis and potential impacts on baseline and other surveys for covered species and natural communities.

## Refine Land Cover Maps

At the landscape level, the Implementing Entity will monitor, using aerial photos or satellite imagery, the extent and distribution of land cover types within the study area every 5 years. If feasible, this monitoring could occur at a more refined level following significant natural events that affect the reserve system (e.g., flood and wildfire). This effort will begin during the Inventory Phase but will continue throughout all phases of Plan implementation. Land cover mapping will be verified in the field at sites where air-photo interpretation is difficult. Species models, including maps, will be improved as new data become available.

## Assess and Monitor Landscape Linkages

Prioritizing, acquiring, assessing, managing, and monitoring landscape linkages are important tasks at the landscape level (**Table 5-9** and **Figure 5-6**). One of the primary goals of the conservation strategy is to sustain and enhance the effective movement and genetic exchange of native organisms within and between natural communities inside and outside the study area. To monitor landscape linkages the Implementing Entity will use a combination of compliance monitoring (to ensure that land acquisition requirements are met) and effectiveness monitoring (to ensure that species utilize linkages effectively and that management actions to increase permeability or improve connectivity are successful). Effectiveness monitoring will include studies of wildlife and plants.

The inventory phase of monitoring will prioritize acquisition of linkages, develop management protocols to enhance linkages, and develop success criteria for the effectiveness of linkages at sustaining movement and genetic exchange. The targeted studies phase will test methodologies for monitoring linkages. The Implementing Entity will evaluate whether linkages are successful at the small scale (e.g., testing use of culverts by target species using camera traps, track plates, or other techniques) and the large scale (e.g., testing connectivity by monitoring indicator species such as elk or badger or through genetic testing of target species). Studies on plant linkages will focus on plant dispersal dynamics and success (Bullock et al. 2006) and on genetic exchange between populations if and where possible. The objective of the targeted studies phase is to determine the most cost-effective and accurate way of evaluating whether landscape linkages are functioning within the context of the Plan. The long-term monitoring phase will implement methodologies identified in the targeted studies phase.

The Implementing Entity will institute a data-collection program to better understand how wildlife moves within and through the study area, both inside and out of the Reserve System. This data-collection program will be initiated

within the first 2 years of implementation. The data collected through this effort will be available for design and implementation of covered road projects. This program will remove the burden of data collection from each participating agency and ensure that all the data collected during the permit term is collected and collated consistently, is maintained in a central location, and is accessible. The conservation strategy includes funding for a feasibility study to determine the extent and needs for wildlife movement in three focal areas: Tulare Hill to Anderson Reservoir, Pacheco Creek (SR 152), and the Pajaro River (see Chapter 5, Section 5.3.2 *Landscape Conservation and Management*, subsection *Feasibility Study*). This feasibility study will be an important part of the data-collection program for wildlife movement in the study area.

Data collection will consist of two parts: monitoring the presence/absence of target species at designated locations across the study area, and monitoring the presence/absence of target species in specific locations determined by future covered activities. Data collection at consistent locations will entail regular and repeatable monitoring at strategic pinch points (e.g., culverts, bridges) in the study area to determine if existing linkages provide connectivity and if enhancement of these crossings increases wildlife movement. This component of the program could entail establishing monitoring stations at specific points or walking transects. Data-collection techniques could include those listed below.

- Installing motion-activated cameras (video or still).
- Installing and monitoring track plates.
- Visual documentation of tracks, scat, or individuals.
- Radio tracking individuals.

By coordinating with the Local Partners, specific monitoring efforts will be implemented in areas where covered activities (e.g., road widening, urban expansion, creek restoration) are planned to occur in the future. This component of the data-collection program can be used to inform project design and to determine more precisely the cumulative impacts that covered activities will have on habitat connectivity in the study area.

In addition, all structures constructed for wildlife movement (tunnels, culverts, underpasses, fences) will be monitored at regular intervals by the Local Partner facility owner and repairs made promptly to ensure that the structure is in proper condition. For facilities owned by entities not participating in the Habitat Plan (e.g., California Department of Transportation [Caltrans]) and where feasible, the Implementing Entity will secure access and data collection agreements with these entities to allow the Implementing Entity to conduct this monitoring.

## Track Climate Change

As indicated in Chapter 10 *Assurances*, climate change-related remedial measures will be triggered if there is an increase in temperature greater than 3°C for any of the three baseline periods measured as a 10-year running average (see

Chapter 10, Section 10.2.1 *Changed and Unforeseen Circumstances*). The annual report will document changes in temperature in the study area throughout the permit term.

## Track Invasive Species

A primary goal of the Plan is to enhance or restore representative natural landscapes to maintain or increase native biological diversity. To that end the conservation strategy proposes to eradicate or reduce the cover, biomass, and distribution of targeted populations of nonnative invasive plants. Within the Reserve System, the Implementing Entity will map occurrences of invasive nonnative plants as described in **Appendix J**, Section J.1.2 *Landscape Monitoring Tools* subheading *Mapping of Invasive Plants*.

Monitoring protocols for invasive plants will be coordinated with those of other local entities to ensure consistency with these programs and facilitate the sharing of monitoring results. This monitoring information will be used to determine the need for management actions to control the spread of existing invasive plants as well as potential future invasions. The effectiveness of control methods will also be reviewed. This monitoring information will be shared with state and local land management agencies charged with the control of invasive plants, including the Bay Area Early Detection Network ([www.baedn.org](http://www.baedn.org)) and the California Invasive Plant Council ([www.cal-ipc.org](http://www.cal-ipc.org)) as well as with managers of adjacent public lands.

During the inventory phase of monitoring, the Implementing Entity will identify and prioritize problems; map occurrences of invasive plants, if possible; develop an exotic species control program; and develop success criteria for the effectiveness of eradication or reduction efforts. The targeted studies phase will develop protocols for invasive species monitoring and test methodologies for monitoring eradication efforts. The objective of the targeted studies phase is to determine the most cost-effective and accurate way of controlling invasive species. The long-term monitoring phase will entail implementation of methodologies identified in the targeted studies phase.

Occurrences of invasive animals will also be documented in GIS and management actions will be developed to prioritize and address nonnative, disruptive animals. For example, feral pig is an invasive species of special concern. Rooting disturbance by feral pigs allows nonnative invasive plants to establish in grassland and aquatic communities, and fall acorn foraging likely has a detrimental effect on oak regeneration (Sweitzer and Van Vuren 2002). During the inventory phase, areas frequented by feral pigs will be identified for feral pig eradication (through hunting and trapping) and exclusion (using fencing exclosures and cages). During the targeted studies phase, protocols will be developed to monitor the presence/absence of feral pigs over time. Monitoring will track the effectiveness of feral pig eradication and ensure that exclosures from grassland, oak woodland, and aquatic habitat types are effective and maintained. In addition, protocols will assess the extent and types of damage to vegetation and soils caused by pigs, including detection of exotic plant species in

areas of pig rooting. These protocols will then be used as part of long-term monitoring for feral pig eradication and exclusion.

Instances of disease will be monitored and reported, as they are discovered. The Implementing Entity will maintain a watchlist of dangerous diseases for the study area and will periodically monitor animals and plants, as part of species and natural community monitoring, to ensure that any occurrences of diseases are identified.

The Implementing Entity will track, on an annual basis, the status of diseases and nonnative invasive species in order to expeditiously initiate remedial actions described in Chapter 10, Section 10.2.1 *Changed and Unforeseen Circumstances*.

## Track Recreation in the Reserve System

Many areas of the Reserve System will serve the dual purpose of habitat protection and limited recreational use. The impacts of recreational use on biological resources must be monitored and managed adaptively to reduce or eliminate impacts. During the inventory phase, potential impacts on species and communities will be identified, recreational plans developed, and protocols created to evaluate effects of public access and use. During the targeted studies phase, signs of disturbance from recreational use will be documented and assessed annually using established protocols. Long-term monitoring will track trends in recreation impacts to adjust management practices to reduce or eliminate impacts.

## Monitor Disturbance Events

Disturbance events such as fire, flood, and earthquakes will be monitored opportunistically. Should fire or flooding occur in an area that has been previously monitored, the Implementing Entity will ensure that post-disturbance monitoring takes place and that results are incorporated adaptively into management actions. Additional information regarding disturbance tracking is described below, in Section 7.3.2 *Natural Community–Level Actions* subheadings *Chaparral and Northern Coastal Scrub* and *Oak and Conifer Woodland Actions*. The Implementing Entity will monitor the effects of these natural disturbances and implement remedial actions as described in Chapter 10, Section 10.2.1.

### 7.3.2 Natural Community–Level Actions

Natural-community-specific issues such as keystone species, predation, fire, livestock grazing, and altered stream flow are described in **Appendix J** *Monitoring Issues and Tools*. The section below summarizes the specific monitoring actions that the Implementing Entity will carry out to track

environmental issues at the natural-community level and ensure that natural-community-level goals and objectives are being met.

## Grassland Actions

As described in Chapter 5 *Conservation Strategy*, adaptive management in grasslands will be focused on the maintenance and enhancement of native grasses, the benefit of covered species, and the promotion of native biological diversity. Monitoring actions will focus on the effectiveness of management to reduce the presence of nonnative plants, to increase the extent and diversity of native plants, and to promote keystone species (i.e., California ground squirrel) within the natural community for the benefit of native plants and animals, including covered grassland species such as Bay checkerspot butterfly, California tiger salamander, serpentine plants, western burrowing owl, and San Joaquin kit fox. **Table 5-1b** correlates natural community monitoring actions with biological goals and objectives for natural communities.

The monitoring program will evaluate the success of key management techniques such as livestock grazing, prescribed burning, mowing, and seeding to promote native plants and reduce the cover and biomass of nonnative, invasive plant species. Additionally, the program will track the ground squirrel population and evaluate the effectiveness of management and promoting additional burrows and monitoring burrow use. Finally, the monitoring program will track the impacts of nitrogen deposition and other threats on natural community function.

## Assess Condition of Natural Communities

The Implementing Entity will conduct monitoring to assess the status and trends of the grassland community and to evaluate community function. If feasible, information on the historical ecology of grassland will help guide assessments. The tasks listed below will be carried out to document the baseline conditions from which change will be measured.

- Use pre-acquisition assessments and site inventories to document the distribution and vegetation types of grasslands, including patches of serpentine grassland and rock outcrops not captured in existing maps. Methods to quantify and track the conditions of vegetation types will follow those of existing studies such as the vegetation sampling conducted by the CNPS along Coyote Ridge and WRA Environmental Consultants at the Silver Creek Preserve (Evens and San 2004; WRA Environmental Consultants 2006).
- Develop a management-oriented conceptual model for grasslands that includes important factors such as the effects of rainfall, temperature, fire, herbivory (i.e., grazing) and succession to woody communities (e.g., chaparral/scrub or oak woodland), and identify indicators for community function as well as any critical uncertainties that may require additional directed studies (**Figure 7-8**).

- Assess and monitor invasive nonnative plants. This task will entail developing maps and descriptions of the distribution and abundance of target species; their known or potential effects on ecosystem function; native biological diversity; sensitive natural communities; covered species; and the means and risk of the spread of nonnative species to other areas within and outside the reserves. Focus on species that have the greatest potential to threaten grasslands such as yellow and purple star-thistle, barbed goat grass, teasel, and others.
- Assess the historic extent, conditions, and fire return interval of grassland within the study area using aerial photographs and historic records.
- If prescribed burns are feasible and desirable, prepare burn plans that describe pre- and post-burn monitoring to determine effects.
- Assess grassland landscape connectivity between reserves.
- Assess and track the health of serpentine rock outcrops and serpentine seeps if necessary beyond the monitoring for rare plants that occur in these communities (Santa Clara Valley dudleya and Mount Hamilton thistle).
- Examine potential negative impacts of grazing on sensitive communities and substrates such as rock outcrops and seeps.
- Identify and track additional threats (such as nitrogen deposition) and manage adaptively to contain these threats.

## **Monitor Actions to Promote Native Plants and Reduce Invasive Species**

As discussed in Chapter 5 *Conservation Strategy*, the biological goals and objectives for grasslands include implementation of management actions that will promote propagation of native plants, reduce and control invasive nonnative species, and encourage native biodiversity through the maintenance of dynamic mosaics of vegetation types and biological gradients. Specific tasks to further these goals and objectives are listed below.

- Develop success criteria for grassland enhancement and evaluate the success of management actions (i.e., grazing, burning, mowing, and seeding) in reducing nonnative plants and promoting the extent and diversity of native plants.
- Develop guidance for grazing within the study area and grazing plans for specific parcels, as applicable, using an experimental approach to achieve the biological goals and objectives.
- Develop pilot projects that test the effects of different grazing practices (e.g., grazing intensity, duration, season, species) on the maintenance and regeneration of native grasses and forbs. If possible, combine grazing treatments with other management techniques such as prescribed burns and hand seeding to detect interactions between management treatments.

- Evaluate the success of any herbicide applications used to control nonnative plants in target areas.

## Monitor Ground Squirrel Populations and Burrow Use

As discussed in Chapter 5 *Conservation Strategy*, California ground squirrel is considered a keystone species in grassland habitats. Because of its importance in functioning as a prey base for some predatory covered species and providing refugia for some terrestrial covered species, it will be important to monitor populations and/or burrow use and density. At the same time, historical rodent-control programs will need to be continued in localized areas to protect vulnerable infrastructure (e.g., pond berms, levees, road embankments, dam faces). The tasks necessary to carry out the goals and objectives pertaining to fossorial mammals are listed below.

- Monitor ground squirrels and/or populations of other small mammals to determine the abundance of prey and burrows for several covered species (e.g., western burrowing owl, California tiger salamander) and many common species.
- Determine if ground squirrel burrows are being used by target species.

## Chaparral and Northern Coastal Scrub Actions

Adaptive management and monitoring of the chaparral and northern coastal scrub communities are built around the conservation goal of maintenance and enhancement of these communities for the benefit of covered species and the promotion of native diversity. To ensure the long-term persistence of the communities, monitoring actions will focus on the effectiveness of management to promote regeneration and succession by maintaining and establishing natural disturbance patterns to create stands of various ages and promote biological diversity.

Many of the plants in the chaparral and northern coastal scrub communities have evolved to be dependent on a disturbance regime of periodic fire for regeneration and succession (Holland 1986; Hanes 1988; Schoenherr 1992). In chaparral communities, disturbance causes canopy openings that allow for the growth of herbaceous vegetation, which is normally shaded out by a nearly continuous shrub stand. In both chaparral and northern coastal scrub communities, chemicals in smoke and charred wood also stimulate germination in a wide variety of native forbs that lie dormant as seeds in the soil for decades before a fire (see Chapter 3). Periodic disturbance allows for structural diversity by creating a range of age classes and promoting successional diversity within the communities. Also, periodic disturbance prevents the encroachment of both grasslands and conifer woodland and forest into chaparral and scrub.

The monitoring program will evaluate the success of burning or mechanical thinning to maintain canopy gaps and promote regeneration. Monitoring will

also focus on identifying areas where adjacent natural communities are encroaching into chaparral and scrub so that appropriate management actions can be implemented at those sites.

## **Assess Condition of Natural Community**

Regeneration and succession stages within the chaparral and northern coastal shrub communities will be managed through both a prescribed burn program and mechanical thinning. The tasks listed below will be carried out to document the baseline conditions from which change will be measured.

- Use pre-acquisition assessments (updated land cover mapping, assessments of habitat suitability for covered species, air photo interpretation) and other field verification to establish the distribution and abundance of small stands of chaparral and northern coastal scrub (<10 acres) not mapped for the Plan that may be important in increasing connectivity between larger stands.
- Develop a conceptual model for the natural community and identify indicators for community function as well as any critical uncertainties that may require additional directed studies.
- Assess the historic extent, conditions, and fire frequency of chaparral and northern coastal scrub stands within the study area using aerial photographs and historic records of fire in the area. This information will be used to determine whether active management is required to maintain the structural diversity of these stands in their current extent and condition.
- If prescribed burns are feasible and desirable, prepare burn plans that describe pre- and post-burn monitoring to determine effects.
- Identify areas where grassland, oak woodland and Douglas-fir habitats are encroaching on chaparral scrub, paying close attention to patches that are necessary for maintaining landscape connectivity.
- Conduct targeted research identifying key factors affecting regeneration and succession.

## **Evaluate Effects of Periodic Disturbance**

It is necessary to monitor the responses of the chaparral and scrub communities to wildfires, prescribed burning, and mechanical thinning. The tasks necessary to determine the response of these actions on promoting canopy gaps, regeneration, and succession in chaparral and northern coastal scrub are listed below.

- Develop structural diversity success criteria and compare post-treatment conditions to baseline conditions to measure the effectiveness of prescribed burning on natural community regeneration and succession.
- Compare results of mechanical thinning to structural diversity success criteria and baseline conditions, and measure the effectiveness of mechanical thinning on natural community regeneration and succession.

## Track Adjacent Natural Community Encroachment into Chaparral

The use of prescribed burns is intended to prevent the encroachment of adjacent natural communities into chaparral and scrub communities. Areas burned too frequently risk conversion to grassland, whereas too infrequent burning may result in tree community encroachment. Where the use of prescribed burns is not feasible, there is an increased risk of the spread of trees, especially conifers, into chaparral and scrub communities. For example, there are areas in the Santa Cruz Mountains and in the Diablo Range in Henry W. Coe State Park where conifer encroachment has already taken place. This encroachment presents a risk of not only overall loss of habitat extent, but also the loss of key stepping stone patches necessary for maintaining habitat connectivity and corridors for species movement and distribution. The tasks necessary to track the spread of natural communities into chaparral and scrub are listed below.

- Monitor chaparral and scrub stands within reserves through vegetation sampling and periodic interpretation of aerial photographs to ensure that the overall extent of these stands is not declining substantially.
- Adaptively manage the community to prevent encroachment of grassland, oak woodland, and conifer forest in target areas where any significant encroachment is identified.

## Oak and Conifer Woodland Actions

The conservation goal of maintenance and enhancement of oak and conifer woodland communities to benefit covered and other native species serves as the basis for the adaptive management and monitoring strategy. To ensure the long-term persistence of these communities, monitoring actions will focus on the effectiveness of management to enhance the natural processes and native species diversity found in these communities.

Persistence of native plant diversity in oak and conifer communities is dependent on a variety of limiting factors. Seedling recruitment and regeneration within oak woodlands can be limited by invasive weeds and nonnative plants in the understory (Jones & Stokes 1995), mammal herbivory (Borchert et al. 1989; Bartolome et al. 2002; Tyler et al. 2002), and seed predation by feral pigs (Sweitzer and Van Vuren 2002). Depending on timing, frequency, and intensity, fire may have a negative or no effect on recruitment and regeneration in oak woodland (Griffin 1977; Bartolome et al. 2002). However, fire decreases the density of understory weeds and plants, indirectly creating favorable conditions for recruitment and regeneration. Because of the complex interactions of herbivory, grazing, competition from invasive plants, and native species composition, monitoring in the community will focus on determining the primary limiting factors.

In conifer woodlands, plant species recruitment and regeneration are influenced by the buildup of dead plant material on the forest floor and the frequency and

intensity of fire. Periodic fire allows for increased structural and biological diversity by increasing the number of native herbs, creating favorable soil conditions for seedling establishment, and stimulating seed release of closed-cone serotinous pines (Vogl et al. 1988). Like oak woodlands, conifer woodlands can be adversely affected by frequent or intense fires.

Certain areas of oak and conifer woodlands have been severely limited in their ability to recruit and regenerate native species, resulting in the loss of natural processes and native species diversity (Pavlik et al. 1991). These areas will be identified and targeted for enhancement within the study area.

The monitoring program will evaluate the effects of wildfires, prescribed burning, and mechanical thinning on the regeneration and recruitment of dominant plants in oak and conifer woodlands. Additionally, the effectiveness of other enhancement efforts will be evaluated at target sites.

## Assess Condition of Natural Community

Recruitment and regeneration within the oak and conifer woodland communities will be managed through a limited prescribed-burn program, mechanical thinning, and other enhancement tools (e.g., seeding). Documenting the baseline conditions against which change can be effectively evaluated will entail the tasks listed below.

- Using recent aerial photographs, document the range of percent canopy coverage within the Reserve System to estimate structural habitat diversity.
- Use pre-acquisition assessments, site inventories, and other surveys to establish the distribution, abundance, and age structure of each species of oak and conifer within the Reserve System.
- Determine the status of tree recruitment using historical aerial photographs (e.g., Grossinger et al. 2006; San Francisco Estuary Institute 2008). Determine if the current canopy coverage of oaks is increasing, decreasing, or stable within the Reserve System.
- Assess oak stands (e.g., canopy coverage, tree condition, seedling and sapling abundance and survival, population age structure, acorn production) within 2 years of acquisition of each reserve to identify factors that may be limiting ecological functions. If canopy coverage is declining and/or tree recruitment is insufficient, adaptive management actions will be implemented to improve recruitment. These actions will be site specific and may include modifying livestock practices, replanting; fencing saplings; reducing competing herbaceous vegetation; and controlling wild pigs.
- Develop a management-oriented conceptual model for the natural community (see **Figure 7-8** for an example) and identify indicators for community function as well as any critical uncertainties that may require additional directed studies.
- If prescribed burns are feasible and desirable, prepare burn plans that describe pre- and post-burn monitoring to determine effects.

- Begin pre-treatment monitoring of sites considered for enhancement. Develop criteria for measuring success.

## Evaluate Effects of Periodic Disturbance

It is necessary to monitor the responses of the oak and conifer woodlands to wildfires, prescribed burning, and mechanical thinning. The tasks listed below will be carried out to determine the effect of these actions on promoting regeneration and recruitment.

- Develop structural diversity success criteria and compare post-treatment conditions to baseline conditions to measure the effectiveness of prescribed burning on natural community regeneration and recruitment.
- Compare results of mechanical thinning to structural diversity success criteria and baseline conditions to measure the effectiveness of mechanical thinning on natural community regeneration and recruitment.
- Monitor success of burning and thinning to increase native species diversity in mid-canopy and understory of redwood forest, ponderosa pine woodland, and knobcone pine woodland.

## Evaluate Seeding, Planting, and other Enhancement Efforts

The tasks listed below will be conducted to determine the response of enhancement and restoration actions on promoting regeneration and recruitment in oak woodlands.

- Determine indicator species for enhancement efforts and develop success criteria.
- Monitor success of enhancement efforts (seeding and planting, altered livestock practices, fencing saplings, reducing competing herbaceous vegetation, and controlling wild pigs).

## Stream and Riparian Forest and Scrub Actions

Adaptive management and monitoring of stream and riparian forest and scrub are focused on the protection, restoration, and enhancement of these communities for the benefit of covered species and the promotion of native diversity. To ensure the long-term persistence of these natural communities and the species they support, monitoring actions will be the responsibility of the Implementing Entity<sup>5</sup> and will focus on the effectiveness of management to accomplish the following:

---

<sup>5</sup> In some cases, it may be appropriate for the Implementing Entity to contract with SCWVD to conduct monitoring activities within some streams, particularly where there is overlap in covered species and monitoring responsibilities between the Habitat Plan and the proposed Three Creeks HCP.

- improve habitat quality and connectivity for native fish, amphibians, reptiles, and riparian birds;
- establish or duplicate the effects of natural disturbance in target areas;
- enhance or restore riparian forest and scrub;
- improve channel function; to reduce anthropogenic sediment input to and storage in streams; and
- decrease the spread of nonnative invasive plant species.

Riparian woodland is dominated by trees and shrubs associated with streams and permanent and intermittent water sources. Riparian scrub is an early successional stage of riparian forest. Due to its dependence on stream channels, riparian vegetation is adapted to a particular disturbance regime. The dominant riparian species (Fremont cottonwood, white alders, and several willow species) generally require bare mineral soil and high light levels for germination. Floods can provide these conditions through the processes of erosion and deposition.

Streams throughout the study area are highly regulated due to the presence of reservoirs and the role of streams as conveyance features for flood protection and water supply (groundwater percolation). Reservoirs modify stream flows, reducing flood peaks and increasing summer stream flow, including during many drought years. The conservation strategy aims to improve the habitat quality of streams and to increase overall ecological functions and values (e.g., native species richness and diversity, vegetative cover, wildlife habitat function). The monitoring program will evaluate the effectiveness of achieving these objectives as well as additional objectives focused on promoting community functions, habitat heterogeneity, and connectivity, including specific success criteria for maintaining hydrologic and geomorphic stream processes or duplicating their effects.

## **Assess Condition of Natural Community**

The establishment of ecological indicators and establishment of success criteria are integral to ensure the maintenance and restoration of habitat quality and ecological functions and values for the covered species. Documenting the baseline conditions against which indicators and success criteria can be effectively evaluated will entail the tasks listed below.

- Use pre-acquisition assessments and site inventories to verify the distribution and abundance of riparian forest and scrub mapped from air photos, and to develop maps of permanent, intermittent, and ephemeral streams.
- Inventory riparian and stream corridors within or outside of the reserves to identify stream segments suitable for enhancement or restoration. Corridors outside reserves will be identified based on importance for covered species and access.

- Use data from USGS gauging stations and/or weather stations to collect information on flood processes and their effects on other hydrogeomorphic processes and riparian communities.
- Assess the connectivity of stream and riparian corridors throughout the study area and between reserves and other public lands.
- Develop a management-oriented conceptual model for streams and riparian forest and scrub (see **Figure 7-8** for an example for grasslands), and identify indicators for community function as well as any critical uncertainties that may require additional directed studies.
- Assess nonnative invasive plants (e.g., giant reed, Acacia), including maps and descriptions of their distribution and abundance; their known or potential effects on ecosystem and hydrogeomorphic functions, native biological diversity, sensitive natural communities, and covered species; and the means and risk of their spread to other areas inside and outside the reserves.
- Investigate and document historical natural disturbance regimes in streams, and document hydrologic changes that may be affecting stream and riparian systems.

## Monitor Riparian Restoration Projects

Monitoring restored riparian habitat will ensure that the natural community is functioning as habitat while providing for ecological processes in the larger landscape. Prior to the initiation of restoration projects, the effects of restoration techniques tested in pilot projects<sup>6</sup> must be evaluated for their efficacy in restoring or duplicating the effects of ecological processes, habitat quality, native cover regeneration, and hydrogeomorphic conditions. It is from these pilot projects that indicator species will be selected and success criteria developed for large-scale restoration projects. The monitoring activities listed below will be the responsibility of the Implementing Entity<sup>7</sup> and will ensure that financial resources are properly allocated and greater success in restoration efforts is achieved.

- Evaluate existing programs for successful monitoring protocols that are appropriate to riparian restoration within the study area.
- Initiate a pilot project to develop restoration measures for individual sites or stream reaches. These measures will include descriptions of plant material requirements (e.g., collected and propagated from local sources); planting and construction methods; and adaptive management and monitoring

<sup>6</sup> Although individual project proponents would not be required to carry out pilot studies, the Implementing Entity will evaluate restoration and/or creation proposal based in part, on pilot studies conducted for the Reserve System. The Implementing Entity will also consider the history of the project proponent performing successful wetland restoration elsewhere and whether the restoration or creation project is consistent with the conservation strategy of the Plan.

<sup>7</sup> The same riparian, stream, wetland, and pond monitoring requirements apply to all Permittees and those under their jurisdiction when aquatic restoration is proposed to offset wetland fees (see Chapter 9, Section 9.4.1).

requirements. The results of pilot projects will guide future restoration efforts.

- Determine indicator species for monitoring restoration, and develop success criteria such as the amount of Shaded Riverine Aquatic (SRA) habitat.
- Monitor the effects of active and passive restoration throughout the Reserve System in target reaches. Success criteria will be developed during Plan implementation and could include the creation of native cover and the restoration of natural hydrogeomorphic and ecological processes as well as native- or covered-species response.
- Monitor the effects of livestock access and livestock exclusion on community composition and recruitment of dominant trees and shrubs.
- Monitor mitigation sites that are beyond their establishment periods (i.e., no longer sustained by irrigation), but have not achieved their success criteria, for stress due to low soil moisture or high evapotranspiration rates. See Chapter 10 *Assurances* for remedial measures if drought occurs (*Drought*).
- Monitor SCVWD natural reservoir inflow data in the study area to determine if the seasonal inflow at the end of April indicate a dry year (near 75% of inflow). See Chapter 10 *Assurances* for remedial measures if drought occurs (*Drought*).

## Evaluate Effects of Periodic Disturbance

It is necessary to monitor the responses of river and riparian communities to periodic flooding. The value of promoting a natural floodplain or allowing target areas to flood will be assessed opportunistically. The tasks listed below will be conducted by the Implementing Entity to determine the response of flooding on creating or maintaining riparian vegetation and improving channel structure.

- Develop structural diversity success criteria and compare post-treatment conditions to baseline conditions to measure the effect of flooding on natural community regeneration and succession.
- Compare results of mechanical thinning (an action which could mimic the effects of natural flooding and drought) to structural diversity success criteria and baseline conditions and measure the effectiveness of mechanical thinning on natural community regeneration and succession.

## Monitor Stream Restoration Projects

Monitoring stream restoration projects will focus on the recreation of the natural hydrogeomorphic processes of confined and degraded stream channels and the restoration of ecological processes. Removal of confined channels restores floodplain connectivity, allowing for greater dispersal distances of target species that use both aquatic and upland habitats. Stabilization of degraded stream channels reduces stream impairment by anthropogenic sources of sediment. The

tasks listed below will be conducted by the Implementing Entity to evaluate the efficacy of stream restoration projects.

- Develop success criteria and monitor success of restored areas in recreating natural hydrogeomorphic and ecological processes.
- Monitor sediment levels both pre- and post-bank stabilization.
- Determine if populations of target species are being restored and/or sustained through improvements in floodplain connectivity and reduced sedimentation. Use survey data from previous monitoring activities and augment the data with additional survey efforts to characterize the seasonal distribution, abundance, and species composition of the target species communities inhabiting restored streams.
- Monitor SCVWD natural reservoir inflow data in the study area to determine if the seasonal inflow at the end of April indicate a dry year (near 75% of inflow). See Chapter 10 *Assurances* for remedial measures if drought occurs (*Drought*).

## Wetland and Pond Actions

Adaptive management and monitoring of wetland and pond communities supports the conservation goal of the maintenance, enhancement, and creation or restoration of ponds and wetland habitats for the benefit of covered species and promotion of native diversity. Monitoring actions will evaluate the effectiveness of management to preserve, enhance, create and restore ponds and to preserve and enhance seasonal and perennial wetlands by increasing native vegetative cover, biomass, and structural diversity within and around the margins. At the same time, monitoring actions will be used to evaluate efforts to reduce the cover and biomass of nonnative invasive plants, access by feral and domestic mammals, and numbers of predatory wildlife and fish species. Monitoring actions will also track the response of target species (e.g., California tiger salamander, California red-legged frog, western pond turtle, tricolored blackbird) to habitat management activities. A reasonable understanding of metapopulation dynamics in the vicinity of these management actions will need to be understood in order to determine whether the actions are causing the change in population level or the population is experiencing typical population fluctuation.

## Assess Condition of Natural Community

The Implementing Entity will conduct monitoring to assess the status and trends of the wetland and pond communities and to evaluate community function. The tasks listed below will be conducted to determine the baseline condition of wetland and pond communities.

- Use pre-acquisition assessments, site inventories, and other surveys to establish the distribution and abundance of ponds and wetlands within and adjacent to the Reserve System. Map the distribution and assess connectivity of wetlands, ponds, and associated upland areas.

- Develop a conceptual ecological model for wetlands and identify indicators for community function as well as any critical uncertainties that may require additional directed studies.
- Prioritize wetlands and ponds for enhancement, restoration, and creation efforts. Potential restoration sites will be identified and selected on the basis of their physical processes and hydrologic, geomorphic, and soil conditions to ensure that successful restoration can occur and be self-sustaining. Identify degraded stream reaches that can be used as pond creation sites.
- Identify wetlands and ponds with abundant nonnative predators or ponds where native species are affected by feral and domestic animal entry. Prioritize these sites for predatory species eradication and exclosures.
- Assess nonnative invasive plants, including maps and descriptions of their distribution and abundance; their known or potential effects on ecosystem function, native biological diversity, sensitive natural communities, and covered species; and the means and risk of their spread to other areas inside and outside the Reserve System.
- Begin pre-treatment monitoring of sites considered for enhancement, restoration, and creation and develop criteria for evaluating success. These criteria will be suitable to evaluate if habitat management increases hydrogeomorphic and ecologic functions, improves habitat value, increases landscape connectivity, and enhances the habitats' ability to support existing and new populations of covered species.
- Identify and track additional threats (e.g., disease, invasive) and manage adaptively to contain these threats.

## **Evaluate Habitat Enhancement, Restoration, and Creation Activities**

It is necessary to monitor the effects of pond and wetland enhancement, restoration, and creation. The tasks listed below will be conducted to determine the response of these actions on increasing native vegetative cover, biomass, structural diversity, and regional connectivity for the benefit of covered species.

- Determine indicator species for monitoring enhancement, restoration, and creation and develop success criteria.
- Initiate pilot project to develop restoration, enhancement, and creation measures for individual sites on the basis of hydrologic conditions; extent and quality of existing habitats (e.g., percent native vegetation and presence/absence of exotic wildlife such as bullfrogs); existing wildlife use; and the potential for adverse effects (e.g., disturbance and/or removal of existing pond/wetland habitat). These measures will include descriptions of plant material requirements (e.g., collected and propagated from local sources); planting and construction methods; and adaptive management and monitoring requirements.
- Determine and quantify changes in habitat that result from wetland and pond enhancement, restoration, and creation. Monitor the survivorship of

planting; quantify vegetated perimeter of pond; and describe habitat quality, connectivity, and species response. Measure success based on criteria described in the monitoring component of the reserve unit management plan.

- Survey wetland and pond capacity and water duration and monitor to ensure that the ecological and hydrogeomorphic functions related to these parameters are maintained or improved.
- Determine use of artificially created ponds by covered species.
- Evaluate the use of wetland-upland complexes by covered species.

### **Evaluate Efforts to Reduce Impacts associated with Livestock and Nonnative Plants and Animals**

It is necessary to monitor the results of efforts to reduce impacts caused by livestock and nonnative species on pond and wetland habitats. The tasks listed below will be conducted to evaluate these effects.

- Determine the effect on the vegetative community and the relative benefit to target covered species of different management treatments such as access/exclusion by livestock and feral pigs, pond draining, and predator control.
- Monitor and record populations and incursions of nonnative predators in target wetlands and ponds.
- Evaluate the success or potential adverse effects of any herbicide applications used to control nonnative plants in target areas.

## **7.3.3 Species-Level Actions**

The Implementing Entity will conduct monitoring to assess the status of covered species and to determine the extent to which the conservation strategy described in Chapter 5 is being implemented and the extent to which biological goals and objectives for species are being met. Species-specific issues and tools are described in **Appendix J** *Monitoring Issues and Tools*. The section below summarizes the specific monitoring actions that the Implementing Entity will carry out to track environmental issues at the species level and ensure that species-level goals and objectives are being met.

Species monitoring will address the following issues relevant to the Plan.

- Status and trends of covered species and other relevant species within the Reserve System (i.e., status and trends monitoring).
- The response of covered species to HCP/NCCP species-specific conservation measures and adaptive management (i.e., effects-of-management monitoring).

- Directed studies to resolve critical management uncertainties for some covered species (i.e., directed studies).

In some cases covered species are the response variables for effects-of-management monitoring at the community level. In those cases, monitoring is described in Section 7.3.2 *Natural Community–Level Actions* above. Species have been categorized into three groups for the purposes of prioritizing monitoring and maximizing efficiencies (see Group numbers in following sections). The grouping of each species will be re-evaluated every 5 years, or if listing status changes, and species may move between the three categories during the course of Plan implementation. The target species for status and trend surveys in acquired parcels will be based on and informed by species models, CNDDDB data and pre-acquisition assessments.

Group 1 species include most of the covered species that are currently listed as endangered or threatened by either state and/or federal wildlife agencies. In most cases, the study area constitutes a critical portion of the species' range. Baseline surveys will be initiated within 1 year of land acquisition. Species-specific conceptual models for Group 1 species will be initiated within 1 year of implementation. Within the year, monitoring variables and additional indicators (biotic or abiotic) will be selected. A survey schedule will be developed to ensure that species status is monitored at the appropriate seasonal periods within the year.

Initially, Group 1 species will be monitored on an annual basis; however, the frequency of monitoring may be adjusted on a species-by-species basis once the status of species in the Reserve System is established. For example, if red-legged frogs have been monitored annually for 15 years and their populations are known to be stable or growing, annual monitoring may be adjusted to bi-annual monitoring in order to reserve budget for other conservation or monitoring actions. Recommended annual monitoring is for species status monitoring only (i.e., not trends monitoring). However, monitoring frequency for species addressed in finalized USFWS Recovery Plans will not fall below the recommended frequencies in these plans. For example, at a minimum, Coyote ceanothus will be monitored every 3 years, as suggested in *The Recovery Plan for Serpentine Soil Species of the San Francisco Bay Area* (U.S. Fish and Wildlife Service 1998).

Targeted studies and monitoring related to the effects of management actions will take place on a time schedule that is relevant to the specific effort at hand, and monitoring schedule for these activities will be developed on a case-specific basis. Success criteria and monitoring protocols will be developed to incorporate monitoring results into the adaptive management strategy. Finally, additional threats to species survival will be identified and tracked. These monitoring actions are common for all Group 1 species within the study area. Monitoring will ensure continued species existence within the study area by tracking species population status and trends.

Group 2 species are not currently listed, but the study area constitutes a critical portion of the species' range. On average, a moderate level of monitoring effort

will be needed for these species. Baseline surveys will be conducted within 2 years of land acquisition. Species-specific conceptual models will be developed on an as-needed basis. Monitoring variables and additional indicators (biotic or abiotic) will be selected within 1 year. A survey schedule will be developed to ensure that species status is monitored every 2–3 years. Success criteria and monitoring protocols will be developed to incorporate monitoring results into the adaptive management strategy. Finally, additional threats to species survival will be identified and tracked. These monitoring actions are common for all Group 2 species within the study area. Monitoring will ensure continued species existence within the study area by tracking species population status and trends.

Species in Group 3 may or may not be listed but the study area is not considered a critical component of the species' range. A relatively lower monitoring effort will be undertaken to establish the status and trends of these species. Baseline surveys will be conducted within 5 years of land acquisition. Monitoring variables and additional indicators (biotic or abiotic) will be selected. A survey schedule will be developed to ensure that species status is monitored at least every 5 years but up to annually, as appropriate. Success criteria and monitoring protocols will be developed to incorporate monitoring results into the adaptive management strategy. Finally, additional threats to species survival will be identified and tracked. These monitoring actions are common for all Group 3 species within the study area. Monitoring will ensure continued species existence within the study area by tracking species population status and trends.

## Monitoring Partial Impact to Plant Occurrences

In addition to status and trends monitoring within the Reserve System, covered plant occurrences that may be partially adversely affected by covered activities will be monitored. The purpose of the monitoring will be 1) to assess whether the impact reduces the long-term viability of the occurrence and whether supplemental management actions are feasible and warranted, and 2) to determine whether an additional occurrence must be protected, enhanced, or created in the Reserve System to offset this partial impact (as defined by Chapter 6, Section 6.6.2, subheading *Condition 20 Avoid and Minimize Impacts to Covered Plant Occurrences*). Baseline data will be collected before the covered activity is implemented.

Covered plant occurrences that are partially permanently affected (i.e., long-term viability is not reduced below the thresholds described in Chapter 6, Condition 20) by covered activities will be monitored by the Implementing Entity unless the impact is less than 5% of the total population size as measured by the number of individuals. If the impact is less than 5% of the total occurrence size, then the impact is not considered significant with regard to long-term viability and will not require monitoring nor will it count as a permanent impact. This exception applies to all covered plant species except Coyote ceanothus.

Specific monitoring protocols and success criteria will be developed during implementation as appropriate for each covered plant species, according to the

guidelines discussed here and in Condition 20 in Chapter 6. It is possible that only a portion of the occurrence will be located on the covered activity project site. In such instances, the monitoring protocol will address this issue. Three possible monitoring approaches include the following:

1. If the landowner agrees, the Implementing Entity will obtain access to the adjacent sites on which the rest of the plant occurrence is located, and surveys will include the entire occurrence.
2. If access to adjacent site(s) is not possible, or if for some other reason it is not feasible to survey the entire occurrence, then an alternative will be developed to estimate the extent and condition of the adjacent portion of the occurrence.
3. If only a small portion of the occurrence is on adjacent properties, then only the portion of the occurrence on the project site will be monitored and assessed for viability. The determination whether this is a full impact will be made based on the results for only the accessible portion of the occurrence.

Analysis of the monitoring results for annual species will take into account annual population variation that may have affected the baseline data. For example, if the baseline year was exceptionally wet, an annual population may have been very high. Subsequent reductions in population could be partially caused by drier conditions as well as impacts from the covered activity. If extreme or unusual climate conditions affect the species, then monitoring will be extended 1 or 2 years, as appropriate to assess impacts and success.

For annual species, the minimum post-construction monitoring period will be 5 years. Monitoring will include estimates of percent cover and number of individuals. An occurrence will be assumed to retain long-term viability and will not require replacement in the reserve system if the decline in occurrence size and percent cover from pre-project conditions is less than 25% over the monitoring period, unless site-specific conditions otherwise suggest substantial declines in viability.

For perennial species, the minimum post-construction monitoring period will be 3 years. Monitoring will include estimates of percent cover, recruitment of seedlings if impacts included removing individuals, and measurements of adult plant health (e.g., signs of disease, herbivory, nutrient deficiencies, etc.). An occurrence of a perennial covered species will be assumed to retain long-term viability and will not require replacement in the reserve system if the decline in seedling recruitment and percent cover from pre-project conditions is less than 25% over the monitoring period, unless site-specific conditions otherwise suggest substantial declines in viability.

**Tables 5-1c and 5-1d** correlate monitoring actions with biological goals and objectives for wildlife and plant species, respectively. Species-specific monitoring actions are discussed in detail below.

## Bay Checkerspot Butterfly (Group 1)

### Document and Monitor Species Status

Surveys for Bay checkerspot butterfly populations will be conducted on reserve lands with modeled serpentine grassland habitat. Two types of surveys will be conducted within the Reserve System: (1) surveys of larval and adult host plants and reconnaissance level surveys for adult butterflies in suitable but unoccupied habitat, and (2) surveys of post-diapause larvae in occupied habitat. Surveys will be conducted at the frequencies discussed above (i.e., annually) during either the appropriate flowering period for larval host plants, during the late larval period (February–March), or during the peak of the flight period for adults. Surveys will be consistently conducted at the same time of year to facilitate data analysis. Additional information on survey protocols and methodologies is described in the species account for Bay checkerspot butterfly in **Appendix D**.

During implementation, previously identified (through expert opinion and habitat model, **Appendix D**) Bay checkerspot butterfly habitat within the Reserve System will be surveyed for the presence of larval host plants. This information will be used to verify the Habitat Plan's Bay checkerspot butterfly population map in the Reserve System. This will be followed by annual reconnaissance level surveys for adult butterflies during the peak of the flight period. This will generally be pedestrian surveys through modeled habitat and butterflies will be identified with the aid of binoculars (Santa Clara Valley Water District 2005; Santa Clara Valley Transportation Authority 2006; WRA Environmental Consultants 2006). These surveys will serve to detect shifts in distribution and new colonization of habitat within the Reserve System. Following colonization, a more rigorous sampling approach will be used as described below. Surveys for new populations will be focused in areas of potential habitat near the largest patches of occupied habitat (Launer and Murphy 1994).

In areas where known Bay checkerspot butterfly populations persist, surveys for post-diapause larvae will occur to gain an estimate of relative abundance of individuals. Protocols for these surveys will use the best techniques available at the time, but in general will include annual sampling at permanent plots stratified to include microclimates present as the result of changes in topography and management regime (Santa Clara Valley Transportation Authority 2006; WRA Environmental Consultants 2006). Additional techniques such as timed larval counts will also be used. This can generate numbers of larvae observed per unit time (typically 10 minutes) and gives some indication of abundance in a given area (S. Weiss pers. comm.). Initially this protocol will establish an estimate of the baseline for each population identified in **Appendix D**. Baseline numbers of individuals may be known because most of these sites are already surveyed annually. In these areas all available existing information will be used and every attempt will be made to reduce the overlap in the survey efforts for efficiency.

Monitoring protocols will be developed to assist the Implementing Entity in demonstrating compliance with species occupancy requirements described in

Chapter 5, Section 5.3.1, subheading *Acquisition of Modeled Habitat for Covered Species*.

## **Evaluate Covered Species Response to Habitat Enhancement and Restoration**

It has been shown that without some form of grassland management (e.g., grazing, mowing, seeding, and burning), serpentine grassland quickly becomes overrun with nonnative plants, and habitat quality decreases for Bay checkerspot butterfly (Weiss 1999) to the point where the species may be extirpated from a site. Accordingly, monitoring activity is ongoing to determine Bay checkerspot butterfly population response to grassland management (Weiss 1999; Fleishman et al. 2000; Hellman 2002; Santa Clara Valley Transportation Authority 2006; WRA Environmental Consultants 2006). As management techniques are implemented within the Reserve System on unoccupied sites, the number and distribution of larval host plants will be documented to determine how habitat quality has changed under different management regimes. In areas where Bay checkerspot butterfly populations already occur, population numbers will be monitored to determine how they are responding to management techniques.

## **Evaluate Use of Translocation to Establish New Populations**

One important biological goal of this Plan is to increase the number of Bay checkerspot butterfly populations in the study area. To this end, serpentine habitat will be acquired and managed appropriately to support the species. During years when populations are at peak numbers, some individuals may disperse to these new reserves; it is hoped that, over time, there would be reproducing populations on those sites in most years. However, if acquisition and management occur but dispersal does not, then translocation of butterflies could be used to establish populations in new reserves (Harrison 1989). A translocation program would be conducted in a controlled and repeatable fashion that allows for quantification of the number of individuals gained or lost during the experimental process. Translocation efforts will be closely coordinated with CDFG, USFWS, and other species experts. Thresholds for loss of individuals would be established beforehand. Translocation would need to be approved by the Wildlife Agencies.

These experimental translocation efforts would be monitored using the methods discussed above.

## **Monitor Additional Threats**

Although serpentine grasslands are typically more resistant than many other vegetation types to invasion by nonnative species, if the habitat is left unmanaged nonnative plants will eventually dominate serpentine grasslands. Monitoring

how grassland species richness changes under various management techniques is essential to understanding which techniques are most effective at retaining habitat for Bay checkerspot butterfly.

A number of pollutants, especially nitrogen-based pollutants, threaten Bay checkerspot butterfly. Deposition of excess nitrogen on serpentine grasslands can alter plant composition. Deposition of nitrogen acts to fertilize the nutrient-poor serpentine soil, exacerbating the problems caused by nonnative species (Weiss 1999). Continued monitoring of nitrogen deposition on serpentine soils and the benefits of managed grazing and controlled burns in areas such as Silver Creek Hills, Tulare Hill, and Santa Teresa County Park (**Appendix E Draft Estimation of Contributions to Deposition of Nitrogen in Santa Clara County for the Santa Clara Valley Habitat Plan**) as well as more precisely quantifying how an increase in passenger and commercial vehicle trips and other new industrial and nonindustrial sources will degrade these habitat types will continue to be a focus under this Plan. The monitoring report prepared each year will document at least one dry season and one wet season nitrogen deposition rate from monitoring conducted by the Habitat Plan or other sources.

## California Red-legged Frog (Group 1)

### Document and Monitor Species Status

Early in the breeding season (November–February, depending on local population behavior), when adult California red-legged frogs typically move into breeding habitat, surveys will be conducted to determine presence/absence of potential breeding adults. Surveys during the breeding season will be conducted based on the most recent protocols adopted by USFWS and CDFG (e.g., U.S. Fish and Wildlife Service 2005)<sup>8</sup>, coordination with the monitoring efforts of other local agencies (e.g., Santa Clara Valley Water District 2005), and best available science.

Once it is established that potential breeding adults are present, a more in-depth survey during the breeding season, as defined by USFWS protocols, will be conducted to determine the size of the breeding population and an estimate of breeding success.

Surveys of all potential breeding habitat will be conducted on land acquired for the Reserve System. Initial surveys will be used to document baseline levels for population monitoring during the permit term and in perpetuity. This baseline information will document the factors listed below.

- Ponds, wetlands, or stream reaches occupied by adult red-legged frogs.
- Adult, larva, and egg mass numbers.

<sup>8</sup> Survey protocols developed by the Wildlife Agencies often have the goal of reliably detecting presence of a species within one or two seasons, which is the time available for most project planning cycles. The goal of surveys on reserve lands will be to definitively determine presence or absence. Wildlife Agency survey protocols may or may not address this monitoring goal.

- Unoccupied breeding habitat that may have the potential to support breeding populations. This item will include an evaluation of the possible factors hindering successful breeding at that location.
- Assessment of upland habitat for potential refugia around occupied and potential breeding habitat.
- Presence of bullfrogs and nonnative, predatory fish species in occupied or potential habitat.
- Presence of other factors (threats) seemingly affecting breeding success at a given location where breeding is occurring.
- Estimate of the distance between known or potential breeding sites to help guide creation or enhancement of more robust populations.

This information will be documented in GIS layers and used to prioritize areas for enhancement and restoration. The management actions for target upland areas surrounding breeding habitat will also be described. This will aide in prioritizing potential unoccupied breeding habitat to be enhanced or restored to support breeding adults in the future.

In years following baseline data collection, visual monitoring for California red-legged frog population status will take place annually, during the breeding season, as defined by USFWS protocols. Egg mass counts and adult counts obtained during visual surveys will be used to determine the local population of California red-legged frogs and will contribute to an overall population status and trends assessment across the Reserve System.

If sufficient information is not obtained via visual monitoring—dip-netting, seining, hand catching, or other methods developed during implementation will be used to capture adults, juveniles, metamorphs, and larvae in habitat where adults have been documented during protocol-level surveys. Those more intensive methods will only be employed every 5 years to minimize impacts on local populations.

Monitoring protocols will be developed to assist the Implementing Entity in demonstrating compliance with species occupancy requirements described in Chapter 5, Section 5.3.1, subheading *Acquisition of Modeled Habitat for Covered Species*.

## Evaluate Covered Species Response to Flow Regulation

Flows could also change as a result of dewatering events described in Chapter 2, *Land Use and Covered Activities*. If California red-legged frog populations are found in streams hydrologically affected by existing dams in the permit area, the Implementing Entity will monitor the effects of flow regulation on the species.

## Evaluate Covered Species Response to Habitat Enhancement, Restoration, or Creation

Potential breeding habitat that is targeted for enhancement, restoration, or creation of habitat will be monitored after treatment to determine the response of breeding California red-legged frogs to habitat-management actions. The relative success of different management actions for maintaining or increasing red-legged frog populations will be assessed to guide future management efforts.

The effectiveness of enhancement and restoration management actions in occupied breeding habitat will be monitored by observing changes in the number of egg masses detected during breeding-season surveys (as defined by USFWS protocols) over time. In addition, the numbers of adults, juveniles, meta-morphs, and larvae that are observed during those surveys will be used to help determine how population levels are responding. The available breeding habitat will be quantified in acres, and population numbers will be recorded as the number of detections per acre in ponds and wetlands. In streams, breeding surveys will cover the amount of riverine habitat that a surveyor can comfortably survey during an 8-hour period. Stream surveys are based on linear miles. In order to calculate acreage the width of the wetted stream channel will be taken for every 500 feet of linear survey and an areal estimate will be calculated. This area will be quantified in acres, and the number of detections per acres will similarly be recorded. Reserve unit management plans will identify which stream reaches, ponds, and wetlands will be monitored, and at what frequency the monitoring will occur, to determine habitat availability and population response to management actions. Those habitat features will be monitored to record changes over time. Monitoring frequency will be established in the reserve unit management plan.

In order to initially determine the peak egg-laying month for different parts of the Reserve System additional egg mass surveys will be conducted once a week, for select sites, during the peak egg-laying period (Bobzien and DiDonato 2007). Depending on rainfall and other seasonal factors, surveys could begin up to two weeks prior to or two weeks following the peak egg-laying month. March has been noted as the peak egg-laying period for California red-legged frogs in nearby Alameda and Contra Costa Counties (Bobzien and DiDonato 2007). The peak egg-laying period for the Reserve System will be determined by surveying the potential and known breeding sites once a week starting in the beginning of January until no more new egg masses are observed, in order to determine the peak egg-laying period for individual water bodies within the Reserve System. If egg masses are detected in the first round of surveys, the following year's surveys will begin earlier (1–2 weeks) so as to establish when the onset of breeding typically occurs. Once the peak egg-laying period is determined for different parts of the Reserve System, these weekly egg-mass surveys would cease and singular egg-mass surveys would be completed at the same time as visual surveys. The overall reproductive output (i.e., number of egg masses) will be recorded during the survey period and each will be recorded with a handheld GPS unit. Newly created ponds will be monitored in the same manner.

In some instances more specific monitoring will be conducted. For example, radiotelemetry studies have been designed to determine how a local population (breeding pond) of red-legged frogs uses the upland areas around that pond during the breeding and non-breeding season (Rathbun and Murphy 1996; Bulger et al. 2003). Radiotelemetry studies may be done in the study area if the results will significantly benefit the Monitoring and Adaptive Management Program for the California red-legged frog. Radiotelemetry could be used to determine how breeding populations from several ponds or streams interact and if breeding red-legged frogs move between ponds during or between breeding seasons. Finally, there is some speculation that creating new pond habitat is a good method for increasing the red-legged frog population in a given area but that there may be little or no interaction between pond-breeding frogs and stream-breeding frogs (S. Bobzien pers. comm.). Monitoring adults using radiotelemetry would help determine whether red-legged frogs are using stream, pond, and wetland habitat within the Reserve System, or if they are more selective in their habitat use. Once conceptual models for red-legged frog have been developed, implementation of these studies will be prioritized on the basis of data gaps identified and the information needed to more effectively manage frogs in the study area.

Additional habitat enhancements, such as changes in flow regimes, could be implemented in streams that support California red-legged frog habitat. Monitoring how these changes affect habitat quality and different life stages of development will be important.

## **Evaluate Use of Adjacent Uplands and Nonbreeding Aquatic Habitats**

Monitoring habitat condition will occur in upland areas and nonbreeding stream habitats adjacent to occupied breeding habitat. Monitoring of upland habitat will also occur adjacent to unoccupied breeding habitat that is being actively managed for California red-legged frogs. Although unoccupied breeding habitat may not be the result of deficiencies in upland habitat, problems in upland habitat may contribute to lack of breeding, and monitoring will help identify threats. Due to the importance of both breeding and upland habitat to the success of this species, this information will be used to determine what the limiting biological factors are for unoccupied breeding habitat.

In general, changes in breeding populations over time will be correlated with land management in surrounding upland areas. Monitoring for changes in breeding success will help determine how those management techniques are affecting the population. For example, if prescribed burning, or mowing to mimic burning, is instituted in uplands surrounding California red-legged frog breeding habitat, and the population increases in that breeding pool over time, then some of that success might be attributable to the upland management techniques. In addition, monitoring the response of ground squirrel colony size and burrow density to upland management techniques will be used as a proxy to determine the quality and quantity of upland habitat available for California red-legged frogs. The response of riverine populations of red-legged frogs will be

monitored with respect to changes in riparian vegetation and corridor widths as the result of enhancement or restoration activities that occur under this Plan.

## **Evaluate Response of Predator Control Programs**

During baseline surveys to document the status of covered species populations, breeding habitat occupied by nonnative species will be identified. These data will inform management actions within the Reserve System. Subsequent surveys for bullfrogs and predatory fish will be conducted to determine the effectiveness of eradication efforts. Threat-eradication efforts for California red-legged frog will focus on reducing or eliminating bullfrogs and predatory fish as the primary threats to tadpole persistence (Lawler et al. 1999). Post-treatment surveys will also allow for an assessment of the response of native amphibian populations to invasive species eradication.

## **Monitor Additional Threats**

Monitoring will be conducted for diseases including chytrid fungus and any other harmful diseases that are discovered in the Reserve System during implementation. This monitoring will include assessing the effectiveness of any disease-control measures. Spreading of these diseases becomes a concern when biologists access more than one breeding site in a short period of time. Biologists will utilize accepted antiseptic protocols during all aquatic survey work to minimize the potential for cross-contamination.

# **Western Burrowing Owl (Group 1)**

## **Document and Monitor Species Status**

The Implementing Entity will carry out two separate survey efforts in support of the burrowing owl conservation strategy—nest surveys and population surveys.

### **Nest Surveys**

Each year, the Implementing Entity will coordinate with survey efforts conducted at known nesting sites in the permit area including surveys conducted at San José International Airport, Moffett Federal Airfield, Shoreline at Mountain View, VTA Cerone bus maintenance yard, and San Jose/Santa Clara Water Pollution Control Plant buffer lands. Additional locations will be surveyed in subsequent years as new colonies are formed or discovered over the permit term. The Implementing Entity will coordinate with survey staff at the first three locations to obtain data from ongoing annual survey efforts and will provide guidance on the survey information required to inform regional data collection. The Implementing Entity will be responsible for conducting surveys at the last two locations (and any new colonies that may be discovered during the permit term) and will use the same methodology across sites to ensure consistency. All surveys will be conducted consistent with California Burrowing Owl Consortium

methodology (California Burrowing Owl Consortium 1993). Data collected from the annual survey sites will be used to track the number of adult burrowing owls and to assess reproductive status. Information will contribute to a rolling population viability analysis in the region. Collectively, the data will inform the adaptive management of this species and will help prioritize use of funds for burrowing owl conservation under the Plan. The first annual survey will occur during the first full year of Plan implementation and each year thereafter.

### **Population Survey**

The Implementing Entity will also coordinate with other South Bay local governments, special districts, and non-profit organizations every 3 years to assess status of the burrowing owl population in the study area and the expanded study area for burrowing owl conservation. These survey efforts are aimed at identifying occupied and potential burrowing owl habitat in the four burrowing owl conservation regions. The focus of this larger survey effort is to document population expansion into new areas. This 3-year survey will help determine whether the range of nesting burrowing owls in the study area and expanded study area for burrowing owl conservation is stable and, possibly, expanding. Analysis of the survey results will encompass the areas surveyed annually, areas with historical or recent occurrences of nesting burrowing owls, and areas with highly suitable habitat that has not been occupied in the past. The initial population survey, which will occur during the first full year of implementation, will build on information collected on burrowing owl nest locations during the Habitat Plan planning process (Barclay 2008).

### **Evaluate Species Response to Habitat Protection and Enhancement**

Monitoring the response of the western burrowing owl population to prescribed management will be difficult because population numbers are very low and the site fidelity of nesting owls is largely unknown in the study area and expanded study area. To gain a comprehensive understanding of how the population and individual nesting pairs respond to management actions, multiple approaches will be used. By establishing periodic surveys of available nesting and potential nesting habitat, a more precise estimate of the number of nesting pairs in lands protected and/or managed for burrowing owls will be made. The number of nesting pairs in the study area and expanded study area can then be tracked over time to determine whether the numbers change as more habitat is managed for burrowing owls. Where burrowing owls occur on lands managed under the Plan, the response of individual nesting pairs will be tracked to determine how management activities affect productivity. For example, if there is an area where burrowing owls are known to nest and grazing is introduced to stimulate grassland diversity, the productivity of those nesting owls will be tracked to determine if grazing has an effect on the owls' propensity to return to the site each year and the number of young produced over time.

In many cases the density and distribution of California ground squirrels and grassland height will be used as a proxy for assessing the quality and quantity of burrowing owl habitat within the burrowing owl management areas. Baseline

surveys to establish habitat condition, including the distribution and burrow density of California ground squirrels in management areas, will be conducted. The results of these surveys will be used to update the burrowing owl habitat model. An increase in the distribution of California ground squirrels in modeled habitat in response to management actions will be considered an increase in habitat availability for western burrowing owl. Overall success of efforts to promote burrowing owl will be measured by a positive growth rate in the PVA for this species (based on annual increases in the number of adults owls), and by the number of acres managed for burrowing owls.

In areas where California ground squirrels are not present and are unlikely to be reestablished, artificial burrow complexes may be installed to create nesting habitat. These installations will be monitored in accordance with accepted CDFG protocol to determine if they are supporting nesting owls.

Additional monitoring will be required if a program to increase reproductive success of burrowing owls in the South Bay are implemented (Tier 3 conservation actions, **Appendix M**). General success criteria will be defined in close coordination with the Wildlife Agencies. Criteria will be set during the Tier 2 surveys, and based on the success or failure of the program, interim checkpoints will be established to determine if/when the program should cease. Monitoring will include the evaluation of a pilot reintroduction program and a pilot study to determine other methods to increase reproduction of local burrowing owls. Success and the feasibility of replicating the reintroduction program at additional locations, as well as the effectiveness of methods to increase reproduction, will be evaluated.

## **Monitor Additional Threats**

Rapid changes in grassland habitat, such as natural or prescribed burns, could have a temporary effect on burrow availability and prey availability for western burrowing owls. To determine how burrow availability is affected, California ground squirrel colonies will be monitored before and after natural or prescribed fires within managed areas. By monitoring the recovery period for grassland habitat, including variables such as size of the reestablished ground squirrel colony, overall habitat quality and quantity can be assessed.

# **California Tiger Salamander (Group 1)**

## **Document and Monitor Species Status**

During the breeding season, which begins soon after the first cool rains of late-fall and early winter, adult California tiger salamanders migrate to breeding pools. Before hatching and after larvae hatch out and are developing, the probability of detecting presence is highest. Surveys will be conducted during the breeding season using the most recent methodologies that are accepted by USFWS and CDFG. Monitoring actions that take place under the Plan will be

coordinated with those of other local agencies to ensure that unnecessary redundancies are eliminated and that data can inform both processes (e.g., Santa Clara Valley Water District 2005).

During the non-breeding season, when individuals are underground in upland refugia, this species is more difficult to detect and methods to do so are often cost prohibitive. To determine quality and quantity of upland habitat for this species, surveys for California ground squirrel colonies and pocket gopher activity will serve as a surrogate. This is discussed further below. In general, it will be assumed that if upland habitat is suitable and within the range of known dispersal distances from an observed breeding location, then the upland habitat is assumed to be occupied as well. Densities of adult salamanders using upland habitat in a given area will be extrapolated from densities of adult and larval salamanders detected in breeding habitat through seining or other methods.

Surveys of potential breeding habitat in lands acquired for the Reserve System will be conducted according to the survey schedule outlined above. Once it is established that potential breeding adults are present, a more in-depth survey during the breeding season, based on approved methodologies, will be conducted to determine an estimate of the size of the breeding population and an estimate of breeding success. Potential breeding habitat is defined as seasonal and some perennial wetlands, including stock ponds. Some riparian areas within stream corridors could also support breeding tiger salamanders if there are adjacent wetlands or large, slow water areas (e.g., side channels or scour pools) and no predatory fish species. This information will be used to document baseline levels for population monitoring during the permit term and beyond in areas where repeatable testing is appropriate. Baseline information will comprise the following.

- Ponds/wetlands occupied by tiger salamander larvae and/or breeding adults.
- Adult, larva, and egg mass numbers.
- Unoccupied breeding habitat that may have the potential to support breeding populations. This item will include an evaluation of the possible factors hindering successful breeding at that location.
- Assessment of upland habitat around occupied and potential breeding habitat.
- Presence of bullfrogs and predatory fish species in occupied or potential habitat.
- Signs suggesting presence of non-native salamander alleles (hybrid adults, paedomorphs).
- Presence of other factors (threats) that appear to affect breeding success at a given location where breeding is occurring.
- Estimate of the distance between known or potential breeding sites to help guide creation or enhancement of more robust populations.

This information will be documented in GIS layers and will be used to prioritize areas for enhancement/restoration. The management actions for target upland areas surrounding breeding habitat will also be described.

In years following baseline data collection, monitoring California tiger salamander population will take place during each breeding season at the survey frequencies described above in the introduction to Section 7.3.3 *Species-Level Actions*. Larval salamander numbers in select breeding pools will be used to determine the local population of salamanders, within the known dispersal distance from the breeding pool and will contribute to an overall population status and trends assessment across the Reserve System. The breeding pools that will be monitored within each Reserve Management Area will be outlined in its associated reserve unit management plan along with monitoring guidelines and population targets.

Additionally, upland habitat condition and use will be monitored during the breeding season within 0.5 mile of a representative sample of known breeding pools (Trenham and Shaffer 2005). Evaluation of upland habitat condition will be based on best available scientific information at the time. Changes in salamander numbers in breeding pools will be correlated with surrounding land uses. For example, if grazing is implemented as a management activity in an area where grazing previously did not occur, the impact that this has on habitat quality for tiger salamanders will be discerned by determining how it affects the breeding activity at known breeding ponds in the area.

Monitoring protocols will be developed to assist the Implementing Entity in demonstrating compliance with species occupancy requirements described in Chapter 5, Section 5.3.1, subheading *Acquisition of Modeled Habitat for Covered Species*.

## **Evaluate Covered Species Response to Habitat Enhancement, Restoration, or Creation**

Ponds or wetlands that are targeted for restoration, enhancement, or creation will be monitored to determine the response of breeding tiger salamanders to habitat management. Management activities will be correlated with population numbers, and the relative success of different techniques on maintaining or increasing tiger salamander populations will be assessed to guide future management efforts. Newly created ponds and enhanced or restored wetlands and ponds will be monitored for target species response, including presence/absence surveys for tiger salamander larvae and breeding adults.

In addition, upland areas near created, enhanced, or restored breeding habitat will be surveyed for habitat suitability. While surveying for the presence of individuals can be cumbersome (e.g., scoping or excavating ground squirrel burrows) and time consuming, determining accessibility of upland habitat from breeding ponds and its suitability for non-breeding season use is a simpler undertaking. Surveyors will determine whether there are any barriers between breeding habitat and upland sites. Surveyors will also determine if there are sufficient underground refugia available for tiger salamanders during the non-breeding season. Changes in this upland habitat availability and suitability will be correlated with breeding population numbers. For example, if the size of a ground squirrel colony is reduced following a prescribed burn and the next year

the California tiger salamander breeding population is substantially reduced, then it might be inferred that prescribed burning had a negative effect on the tiger salamander population during this brief window.

Similarly, if the vegetative communities surrounding breeding habitat change due to restoration or enhancement (e.g., oak woodland planting, burning, grazing, tree thinning), the impacts on the breeding tiger salamander population will be tracked and its relationship with the management in these upland areas will be inferred. In select instances, directed studies might be developed to better understand how complex management issues influence tiger salamander populations over time.

## **Evaluate Use of Burrows**

Monitoring habitat conditions will occur in upland areas adjacent to a representative sample of occupied breeding habitat. Monitoring of upland habitat will also occur adjacent to unoccupied breeding habitat that is being actively managed for California tiger salamander. Due to the importance of both breeding and upland habitat to the success of this species, this information will be used to determine what the limiting biological factors are for unoccupied breeding habitat. Monitoring the size and burrow density of ground squirrel colonies adjacent to breeding habitat will be essential. Monitoring the response of ground squirrel colony size and burrow density to upland management techniques will be used as a proxy to determine the quality and quantity of upland habitat available for California tiger salamanders.

To develop more detailed information on how California tiger salamanders use underground refugia in upland habitat, burrows and other refugia on the Reserve System can be surveyed using a burrow probe (also known as a “digiscope”). This tool provides the means to confirm or deny occupancy of burrows in upland areas, though this method is not very cost effective for a large Reserve System. Rather, this technique can be used periodically to test the assumptions about upland habitat quality characteristics. In general, it will be assumed that if breeding habitat is occupied then adjacent uplands within typical dispersal distance are being utilized as well.

## **Evaluate Response of Predator Control Programs**

During baseline surveys to document the status of native species populations, a description of breeding habitat that is occupied by bullfrogs and predatory fish species will also be completed. These data will inform management actions within the Reserve System. Subsequent surveys for bullfrogs and predatory fish will be conducted to determine the effectiveness of eradication efforts. This will also allow for an assessment of the response of native amphibian populations to nonnative species eradication efforts.

## Monitor Additional Threats

Monitoring will be conducted for diseases including chytrid fungus and any other harmful diseases that are discovered in the Reserve System during implementation. This monitoring will include assessing the effectiveness of any disease-control measures. Spread of these diseases becomes a concern when biologists access more than one breeding site in a short period of time. Biologists will utilize accepted antiseptic protocols during all aquatic survey work to minimize the potential for cross-contamination.

Nonnative salamanders are known to occur in the study area and are hybridizing with California tiger salamanders covered under this Plan. The degree of hybridization however, varies greatly within the Plan Area. As described in Chapter 5 and **Appendix K**, the management strategy for hybrid salamanders will be incorporated into the reserve unit management plans developed for portions of the Reserve where nonnative tiger salamanders and/or suspected hybrids are detected. Adaptive management involving close coordination with USFWS, CDFG, and other species experts will be critical in addressing this threat during Plan implementation. At a minimum, location, population size, and general condition of nonnative and suspected hybrid populations of salamanders will be documented. The response of native salamanders (e.g., outcompetition, hybridization) will also be monitored closely along with population response to any management actions that are implemented in accordance with the hybridization plan described in Chapter 5 and **Appendix K**.

## Tiburon Indian Paintbrush (Group 1)

### Document and Monitor Species Status

The Kirby Canyon Butterfly Trust closely monitors both known populations of Tiburon Indian paintbrush in the study area. These data will be used as baseline population data for this species. Plant surveys on acquired parcels will be conducted to document new populations.

Tiburon Indian paintbrush status will be monitored over time in relation to baseline population sizes; baseline data will serve as the standard against which future changes are measured. Monitoring will evaluate changes over time and the response of plant populations to management activities. Monitoring will include data on population size, numbers and location; age classes; seedling survival and health and vigor of populations. Location data will be collected by GPS and documented in GIS layers. In addition to annual monitoring, monitoring will always be conducted following events that may have strong effects on population size and condition (e.g., fire, severe weather, human impact). Monitoring methods will be based on up-to-date, repeatable methods of tracking population status over time.

## **Evaluate Covered Species Response to Habitat Enhancement**

Monitoring the response of Tiburon Indian paintbrush to various grazing regimes is already occurring in the study area. This monitoring will continue under the Plan, especially if new management techniques are introduced as a result of Plan implementation. Monitoring surveys will follow appropriate protocols and occur during the flowering period for this species, which is typically April–July. In addition to acquiring data on the target population, studies may be carried out to document changes in grassland communities in and around known populations of Tiburon Indian paintbrush. Changes in plant status will be correlated to changes in the management regime to help determine whether management actions have successfully created opportunities for the population to grow.

## **Targeted Studies**

A goal of targeted studies initiated under the Plan will be to identify any factors that are limiting population expansion of Tiburon Indian paintbrush. For example, land use patterns around known populations could be reducing habitat quality and restricting population expansion. If these land use patterns are correlated with population isolation, or if any other factors are shown to be limiting population growth, then management actions will be prescribed and implemented to change those land use patterns or factors to promote natural population expansion. Monitoring the response of plant populations to those actions will inform future management of these two very important sites.

An additional management action that is prescribed for Tiburon Indian paintbrush is experimental grazing exclusion. When such projects are implemented, appropriate monitoring protocols will be developed to study the population response.

## **Monitor Additional Threats**

The Kirby Canyon Butterfly Trust is currently assessing the effectiveness of excluding feral pigs from areas where known Tiburon Indian paintbrush populations exist. Feral pig rooting is considered a threat to plant populations, although it is also possible that such disturbance could be beneficial if properly managed. It is uncertain if replicated experiments will be possible to determine the most effective balance of disturbance from feral pigs because Tiburon Indian paintbrush population numbers are low. However, monitoring will measure population response to pig-removal efforts, and decisions about long-term exclusion of pigs from these sites will be based on those results.

Rapid changes in grassland habitat, such as fire, could have an effect on grassland species. Tiburon Indian paintbrush populations will be monitored before and after fires, should they occur. By monitoring the post-fire recovery of grassland habitat, which might include variables such as percentage of

reestablished native versus nonnative grassland, an assessment can be made about overall quality of habitat and whether permanent changes in grassland habitat will affect the persistence of Tiburon Indian paintbrush populations.

## **Coyote Ceanothus (Group 1)**

### **Document and Monitor Species Status**

The location and geographic extent of the three known occurrences of coyote ceanothus are well documented within the study area from field observations and air photos (it is the only covered species visible on air photos due to its distinctive color signature). However, data on occurrence size and demography are limited because portions of all three occurrences occur on private land. These three occurrences will be added to the Reserve System and baseline occurrence assessments will be made at that time. The response of each occurrence to management under this Plan will be measured against those baseline occurrence levels. Survey protocols for the species will need to be developed. Occurrence size surveys may include complete counts for small occurrences or statistical sampling and analysis for larger occurrences. All surveys that are conducted will be coordinated with any ongoing survey efforts (e.g., Santa Clara Valley Water District 2005).

Coyote ceanothus status will be monitored over time in relation to baseline occurrence sizes; baseline data will serve as the standard against which future changes are measured. Monitoring will evaluate changes over time and the response of plant occurrences to management activities. Monitoring will include data on occurrence size, numbers and location; age classes; seedling survival and health and vigor of occurrences. Location data will be collected by GPS and documented in GIS layers. Monitoring surveys will occur at frequency intervals described above in the introduction to Section 7.3.3 *Species-Level Actions*. In addition to annual monitoring, monitoring will always be conducted following events that may have strong effects on occurrence size and condition (e.g., fire, severe weather, human impact). Monitoring methods will be based on up-to-date, repeatable methods of tracking occurrence status over time.

### **Evaluate Covered Species Response to Habitat Enhancement**

There may be little grazing pressure on any of the three occurrences due to exclusion fencing, although native herbivores such as deer may browse seedlings. However, if different grazing regimes or other management techniques are employed in these areas, the effects of those techniques on each occurrence will be determined by conducting appropriate monitoring surveys. These surveys will include quantifying how these management regimes change natural communities that surround known occurrences. Recruitment of seedlings will be tracked to determine which management techniques are most effective at increasing occurrence levels.

## Targeted Studies

A goal of monitoring under the Plan is to identify factors that limit coyote ceanothus expansion. Management actions will then be prescribed to remove or reduce those limitations; this process will be adaptively managed through follow-up occurrence surveys.

New occurrences of Coyote ceanothus will be created using field experiments to investigate suitable propagation or planting techniques and determine appropriate seed-sampling techniques from existing occurrences. These targeted studies will be experimental, and the impact that they have on known occurrences will be monitored (i.e., the effects of using existing occurrences as a seed stock for new occurrences).

All created occurrences will be monitored with appropriate protocols to measure establishment success and determine whether this technique is a viable management option. The outcomes of these targeted studies will be used in adaptive management decisions and to inform conservation actions for this species.

Additional targeted studies will be conducted to examine the effects of prescribed burns on coyote ceanothus occurrences. In the past, observers have noted increased recruitment following fires. The goal of experimental burning under this Plan is to determine the importance of fire on plant regeneration and to identify the most effective fire regime for increasing the size of occurrences. Monitoring occurrence response to experimental burning will inform future management action for this species.

## Monitor Additional Threats

If any natural fires occur in areas of coyote ceanothus occurrences, then the occurrences will be monitored to study how the occurrence and species respond. Specific protocols will be developed in the context of the fire and how it has affected the plant occurrence.

## Santa Clara Valley Dudleya (Group 1)

### Document and Monitor Species Status

Although many occurrences of Santa Clara Valley dudleya are well documented in the study area, baseline occurrence surveys will be conducted on modeled habitat in the Reserve System to quantify or estimate the number of individuals in known occurrences and to determine if undiscovered occurrences occur on the property. Because this perennial species is readily identifiable at all times of year, surveys can be conducted at any time. Many of the known occurrences occur on private lands. If these areas are added to the Reserve System, baseline occurrence assessments will be made at that time so that the response of each

occurrence to management can be measured against those baseline occurrence levels. Baseline monitoring is currently being conducted for this species in permanent plots on Coyote Ridge on the UTC parcel (Arcadis 2008).

One key question that will be addressed early in monitoring implementation is the maximum spacing distance for individuals within the same occurrence. Santa Clara Valley dudleya individuals are patchily distributed, clustering on discrete rock outcrops. It is likely that plant interactions decrease with increasing distance from rock-outcrop patches. Occurrences are not likely to be discrete entities but rather a continuum of sub-occurrences. However, an operational “boundary” needs to be defined to delineate occurrences for monitoring and management purposes.

Monitoring will evaluate changes over time and the response of plant occurrences to management activities. Monitoring will include data on occurrence size, numbers and location; age classes; seedling survival and health and vigor of occurrences. Location data will be collected by GPS and documented in GIS layers. In addition to annual monitoring, monitoring will always be conducted following events that may have strong effects on occurrence size and condition (e.g., fire, severe weather, human impact). Monitoring methods will be based on up-to-date repeatable methods of tracking occurrence status over time.

## **Evaluate Covered Species Response to Habitat Enhancement**

The effect of grazing regimes or other management techniques on each occurrence of Santa Clara Valley dudleya will be monitored by conducting surveys according to the same protocols established in baseline surveys. Monitoring studies may also include protocols to quantify how management techniques affect the serpentine grassland habitat that surrounds known occurrence or to assess if these techniques have an effect on Santa Clara Valley dudleya individuals or occurrence.

## **Targeted Studies**

A goal of monitoring under the Plan is to identify factors that limit the expansion of Santa Clara Valley dudleya occurrences. Management actions will then be prescribed to remove or reduce those limitations; this process will be adaptively managed through follow-up occurrence surveys.

## **Monitor Additional Threats**

Grazing by native species (e.g., Tule elk) and livestock is thought to be a threat to Santa Clara Valley dudleya, however the actual threat posed by grazing has not been documented. As serpentine grassland management is implemented, a

replicated experiment design will be used to determine to what extent and by what mechanism(s) livestock grazing affects known occurrences. These studies will also aim to determine the level of protection from grazers that this species needs to remain viable. Such studies will include a grazing exclusion component.

Rapid changes in grassland habitat, such as natural or prescribed burns, could have an effect on grassland species such as this. Santa Clara Valley dudleya occurrences will be monitored before and after fires occur. By monitoring the recovery period for grassland habitat, as well as other variables (e.g., percent native versus nonnative grassland that reestablishes), an assessment can be made about overall habitat quality and whether permanent changes in grassland habitat will affect the persistence of these occurrences.

## **Metcalf Canyon Jewelflower (Group 1)**

### **Document and Monitor Species Status**

Baseline occurrence surveys will be conducted on modeled habitats in the Reserve System to quantify or estimate the number of individuals in known occurrences and to determine if undiscovered occurrences occur on the property. Most of the known occurrences of Metcalf Canyon jewelflower occur on private lands. If these areas are added to the Reserve System, then baseline occurrence assessments will be made at the time of acquisition to assess occurrence levels. Thereafter, the response of each occurrence to management can be measured against those baseline levels. Baseline monitoring is currently being conducted for this species in permanent plots on Coyote Ridge on the UTC parcel (Arcadis 2008).

Monitoring of Metcalf Canyon jewelflower will occur during its flowering period, between April and July, and surveys will occur only when the plants are actually flowering in order to assure recognition. Monitoring will evaluate changes over time and the response of plant occurrences to management activities. Monitoring will include data on occurrence size, numbers and location; age classes; seedling survival and health and vigor of occurrences. Location data will be collected by GPS and documented in GIS layers. In addition to annual monitoring, monitoring will always be conducted following events that may have strong effects on occurrence size and condition (e.g., fire, severe weather, human impact). Monitoring methods will be based on up-to-date repeatable methods of tracking occurrence status over time.

### **Evaluate Covered Species Response to Habitat Enhancement**

The effect of grazing regimes or other management techniques on each occurrence of Metcalf Canyon jewelflower will be monitored by conducting surveys according to the same protocols established in baseline surveys.

Monitoring studies may also include protocols to quantify how management techniques affect the serpentine rock outcrops on which the species grows and/or to assess if these techniques have an effect Metcalf Canyon jewelflower individuals or occurrences.

## Targeted Studies

A goal of monitoring under the Plan is to develop studies that identify factors limiting the expansion of Metcalf Canyon jewelflower occurrences. Management actions will then be prescribed to remove or reduce those limitations; this process will be adaptively managed through follow-up surveys.

New occurrences of Metcalf Canyon jewelflower will be created using field experiments to investigate suitable propagation or planting techniques and determine appropriate seed-sampling techniques from existing occurrences. These targeted studies will be experimental, and the impact that they have on known occurrences will be monitored (i.e., the effects of using existing occurrences as a seed stock for new occurrences). The micro-habitat of this species is serpentine rock outcrops, particularly steeply cut rock faces such as those found in roadcuts, and this habitat may be experimentally created and seeded.

All created occurrences will be monitored with appropriate protocols to measure establishment success to determine whether this technique is a viable management option. The outcomes of these targeted studies will be used in adaptive management decisions and to inform conservation actions for this species.

Metcalf Canyon jewelflower is known to interbreed with its close relative, also a covered plant species—most beautiful jewelflower. There is concern that Metcalf Canyon jewelflower could eventually lose its distinct genetic integrity (Weiss and Wright 2005). Targeted studies will be undertaken to monitor this introgression and develop protocols to protect the genetic integrity of both species.

## Monitor Additional Threats

Grazing by native species and livestock may be a threat to Metcalf Canyon jewelflower. As serpentine grassland management is implemented, a replicated experimental design will be used to determine how livestock grazing affects known occurrences. These studies will also aim to determine the level of protection from grazers that this species needs to remain viable. Such studies will include a grazing-exclusion component.

Rapid changes in grassland habitat, such as natural or prescribed burns, could have an effect on Metcalf Canyon jewelflower since it generally grows in outcrops and roadcuts within a larger grassland matrix. Occurrences will be

monitored before and after prescribed burns, and after any natural fires. By monitoring the recovery period for grassland habitat, as well as other variables (e.g., percent native versus nonnative grassland that reestablishes), an assessment can be made about overall habitat quality and whether permanent changes in grassland habitat will affect the persistence of these occurrences.

## **Foothill Yellow-Legged Frog (Group 2)**

### **Document and Monitor Species Status**

Foothill yellow-legged frogs can be observed year-round in perennial streams. Observing adult foothill yellow-legged frogs is difficult, but possible. Surveys could be conducted throughout the breeding period (April–July), though the probability of detection is generally higher June–July.

During the breeding season, adults, juveniles, and tadpoles could be present in suitable streams, offering the greatest opportunity for detection. Surveys for adults will only be used to determine population levels if multiple surveys are conducted at a given site, all life stages have been counted, and survey coverage is near 100%. Otherwise, these visual detection surveys will only serve to determine presence/absence of the species along a given stream reach.

In most cases, the reproductive output of the population will be measured by counting egg masses in potential breeding habitat. The number of egg masses will be used to determine the relative number of breeding females in a given reach, as well as estimates of overall population health. Observing foothill yellow-legged frog adults or juveniles is difficult and could prove an inadequate method to determining relative population levels along a stream reach. However, all incidental sitings of adults, juveniles, or larvae will be recorded during each egg mass survey. Surveys for foothill yellow-legged frog egg masses will be conducted in known or assumed habitat both within the Reserve System and along stream courses that are outside of the Reserve System but where access has been granted to one of the Implementing Partners. Surveys will be conducted using the best available protocol for this species (e.g., Seldenrich and Pool 2002).

Foothill yellow-legged frogs typically lay most of their eggs during April (Bobzien and DiDonato 2007). This generally coincides with the end of the last high-water period in stream corridors. However, if large storm events occur during April, foothill yellow-legged frogs can delay egg laying to reduce mortality of egg masses from unseasonable high water (S. Bobzien pers. comm.). If there are unusually late storm events, surveys during that year will be shifted to maximize detection of egg masses.

Surveys of potential foothill yellow-legged frog habitat on land acquired for the Reserve System will be conducted according to the survey schedule outlined above. This information will be used to document baseline levels for population monitoring during the permit term and beyond. The baseline surveys will document the characteristics listed below.

- Stream reaches occupied by foothill yellow-legged frog adults.
- Unoccupied breeding habitat with the potential to support breeding populations (typically upstream or downstream of occupied habitat).
- Assessment of riparian vegetation and stream substrate along occupied and unoccupied stream reaches.
- Presence of nonnative bullfrogs, crayfish, or nonnative, predatory fish species in occupied or unoccupied habitat.
- Presence of other factors (threats) seemingly affecting breeding success at a given location.

This information will be documented in GIS layers and used to prioritize areas for protection and enhancement/restoration. This process will be used to determine the potential for unoccupied breeding habitat to be enhanced or restored to support breeding adults in the future. It will also inform how proposed restoration or enhancement of riparian corridors and streams might affect foothill yellow-legged frog breeding sites.

Monitoring protocols will be developed to assist the Implementing Entity in demonstrating compliance with species occupancy requirements described in Chapter 5, Section 5.3.1, subheading *Acquisition of Modeled Habitat for Covered Species*.

## **Evaluate Covered Species Response to Flow Regulation**

Changes in flow downstream of dams could affect remnant populations of foothill yellow-legged frogs in the permit area. Flows could also change as a result of dewatering events described in Chapter 2 *Land Use and Covered Activities*. If yellow-legged frog populations are found in streams hydrologically affected by existing dams in the permit area, the Implementing Entity will monitor the effects of flow regulation on the species.

## **Evaluate Species Response to Enhancement and Restoration of Stream Habitat**

Stream reaches that are targeted for restoration or enhancement will be monitored to determine the response of breeding foothill yellow-legged frogs. The relative success of different techniques for maintaining or increasing foothill yellow-legged frog populations will be assessed to guide future management efforts. Enhancement or restoration of occupied breeding habitat will be monitored by determining changes in the number of egg masses detected during surveys to establish estimates of reproductive output. Surveys will be conducted at the frequencies discussed above.

Ideally, egg mass surveys will be conducted once a week during the peak egg-laying period (Bobzien and DiDonato 2007). Peak egg-laying periods within the

study area will be determined by surveying early in the known breeding period and ending the surveys at the end of the known breeding period or after no new egg masses have been observed, whichever comes last. Survey periods must be flexible to adjust for climate-induced impacts to egg-laying period (e.g., warm, low moisture winter may delay the egg mass laying in April and move it into May.) April has been noted as the peak egg-laying period for foothill yellow-legged frogs in nearby Alameda and Contra Costa Counties (Bobzien and DiDonato 2007). The overall reproductive output (i.e., number of egg masses) will be recorded during the survey period, and each egg mass will be recorded with a handheld GPS unit. This will allow for follow-up surveys of breeding sites in subsequent years.

Additional habitat enhancements, such as changes in flow regimes, could be implemented in streams that support foothill yellow-legged frog habitat. Monitoring how these changes affect habitat quality and different life stages of development will be important.

## **Evaluate Management of Riparian Corridors**

When enhancement or restoration activities are conducted in riparian areas, foothill yellow-legged frog populations will be monitored to determine how changes in riparian vegetation affect the local breeding population. That information will be used to inform future management actions along stream reaches that are occupied by foothill yellow-legged frogs. For example, if trees are removed to open up the canopy of a riparian corridor to promote growth in the understory for early successional songbird species, the response of the yellow-legged frog population along that reach would be of interest. Similarly, riparian restoration that promotes overstory vegetation and subsequently cools target reaches will be monitored for foothill yellow-legged frog response.

In some streams, alternate, off-stream water sources will be provided for livestock to discourage them from entering the stream. Where necessary, fencing will be installed to exclude livestock from particularly sensitive reaches. The foothill yellow-legged frog population and reproductive output will be monitored and compared to baseline conditions to determine if this method affects species response.

## **Evaluate Response to Nonnative Plant and Animal Control**

During baseline surveys, a description of breeding habitat that is occupied by bullfrogs, crayfish, and predatory fish species will also be completed. These data will inform management actions within the Reserve System. Subsequent surveys for bullfrogs and predatory fish will be conducted to determine the effectiveness of eradication efforts. This will also allow for an assessment of the response of native amphibian populations to nonnative species eradication.

In addition, the removal of nonnative vegetation in riparian areas and reseeded with native vegetation may temporarily or permanently change the habitat adjacent to that used by foothill yellow-legged frogs. Population size will be estimated and reproductive output (i.e., number of egg masses) will be monitored along reaches that are restored or enhanced to determine if there are short-term (less than 5 years) or long-term (more than 5 years) effects. The results of this monitoring will inform vegetation management along corridors adjacent to foothill yellow-legged frog habitat.

## **Monitor Additional Threats**

Monitoring will be conducted for diseases and the efficacy of disease control including chytrid fungus and any other harmful diseases that are discovered in the Reserve System during Plan implementation. Spread of these diseases becomes a concern when biologists access more than one breeding site in a short period of time. Biologists will utilize accepted antiseptic protocols during all aquatic surveys work to minimize the potential for cross-contamination.

## **Western Pond Turtle (Group 2)**

### **Document and Monitor Species Status**

Surveys of potential western pond turtle habitat in land acquired for the Reserve System will be conducted to select sites for monitoring and document baseline population levels. These sites will then be revisited and the population levels measured against the baseline to determine the effectiveness of management actions. Baseline surveys will entail an assessment of the characteristics listed below.

- Stream reaches, ponds, wetlands, or reservoirs occupied by western pond turtle adults.
- Unoccupied aquatic habitat with the potential to support populations (typically adjacent to occupied habitat).
- Basking sites that could be monitored repeatedly.
- Adjacent upland overwintering habitat for stream turtles (turtles using ponds remain in the water in winter).
- Adjacent upland nesting habitat, particularly in areas where nesting has been documented in the past.
- Presence of other factors (threats) seemingly affecting breeding success at a given location (e.g., adjacent land use).
- Observations on size structure of the population to ensure that young turtles are present and that successful reproduction is occurring.

This information will be documented in GIS layers and used to prioritize areas for enhancement and restoration. This process will be used to determine the

potential for unoccupied breeding habitat to be enhanced or restored to support western pond turtles in the future. It will also help predict how proposed restoration or enhancement of aquatic habitat and adjacent uplands might affect western pond turtle nest sites.

Western pond turtles can be observed year-round in perennial streams, ponds, and wetlands and on the fringes of reservoirs. Surveys will be conducted at times as early as March, in conjunction with surveys for stream populations of California red-legged frogs, but the highest probability of detection to determine presence of the species is during the summer months when individuals can be counted while basking during the middle of the day. Repeated annual surveys of basking sites will be used as an index for overall population numbers. This method will likely be more effective in ponds and wetlands, where aquatic habitat is well defined, than in streams or lakes where individuals are able to move greater distances through the water.

In many cases, it could be beneficial to install artificial basking sites in ponds or wetlands that would be monitored every year. This would facilitate monitoring in areas where there are no basking sites or where sites are submerged during high-water periods. In streams and along reservoir margins, existing information on species distribution and baseline survey data of suitable basking sites will provide an inventory of future survey sites. Once identified, these basking sites will be monitored at the frequencies described above in the introduction to Section 7.3.3 *Species-Level Actions* to determine the number of individuals present. These results will be used to determine the population level in the area and will allow for some analysis of population response to management actions.

Monitoring protocols will be developed to assist the Implementing Entity in demonstrating compliance with species occupancy requirements described in Chapter 5, Section 5.3.1, subheading *Acquisition of Modeled Habitat for Covered Species*.

## **Evaluate Covered Species Response to Flow Regulation**

Flows could also change as a result of dewatering events described in Chapter 2 *Land Use and Covered Activities*. If western pond turtle populations are found in streams hydrologically affected by existing dams in the permit area, the Implementing Entity will monitor the effects of flow regulation on the species. Monitoring how these changes affect habitat quality and different life stages of development will be important.

## **Evaluate Species Response to Enhancement and Restoration of Aquatic Habitat**

Stream reaches, ponds, and wetlands that are targeted for restoration or enhancement will be monitored to determine the response of western pond turtle populations to those activities. The relative success of different techniques for

maintaining or increasing western pond turtle populations will be assessed to guide future management efforts. Enhancement or restoration of occupied habitat will be monitored by determining changes in the average number of individuals observed during basking site surveys. This method will only be useful at monitoring long-term trends, but it will give some sense of the population response to the change in habitat.

In areas where nesting is known to occur, the number of nesting attempts or the success rate of nests will be monitored to determine how site-specific management prescription are affecting turtles during the nesting period. The opportunities to conduct this type of monitoring may be limited due to the number of known nesting areas and the difficult nature of monitoring nesting turtles without disturbing important nesting areas. The Implementing Entity will determine the best approach for monitoring western pond turtle once reserves are acquired and reserve unit management plans are being developed. Trapping or observations can provide information on the relative abundance of young (small) turtles as an index to reproductive success.

In some streams, alternate, off-stream water sources will be provided for livestock to discourage them from entering the stream. Some ponds will be partially fenced to exclude grazing and promote growth of emergent vegetation. Western pond turtle populations will be monitored and compared to baseline conditions to determine if these methods improve habitat quality and increase numbers of turtles.

Additional habitat enhancements, such as changes in flow regimes, may be implemented in streams that support western pond turtle habitat. Monitoring by the Implementing Entity regarding how these flows affect habitat quality will be important. Changes to riverine systems to conditions that are more natural will inherently benefit western pond turtles in the study area.

## **Monitor Additional Threats**

Nesting sites and nest success are thought to be the limiting factor for this species in the study area. Identifying known or potential nest sites in the Reserve System and along target streams will provide valuable information that informs efforts to conserve the species. Studies have shown that while western pond turtle populations can seem relatively stable due to the presence of adults, there may be minimal recruitment of juveniles into the population (Reese 1996). Focusing on aquatic habitats is important, but extending that focus to include adjacent uplands, where nesting could occur, is critical to guaranteeing the long-term stability of the populations.

## Other Covered Plants (Group 2)

There are 6 other rare plant species covered by this Plan. Their monitoring actions will be comparable and are described below. These plant species include the following:

- Mount Hamilton thistle
- Fragrant fritillary
- Loma Prieta hoita
- Smooth lessingia
- Most beautiful jewelflower

## Document and Monitor Species Status

Baseline surveys will be conducted on parcels that are added to the Reserve System to determine or estimate the number of individuals in known occurrences of covered plants and whether undiscovered occurrences occur on the property. Surveys will be conducted at the appropriate blooming period for each species (see **Appendix D** for blooming periods). Survey protocols will be developed for each species. When feasible and efficient to do so, surveys for serpentine plants will be included with the above-described surveys for Bay checkerspot butterfly. Surveys may entail counts for small sub-occurrences or statistical sampling and analysis for larger occurrences. Baseline monitoring is currently being conducted for fragrant fritillary, most beautiful jewelflower, smooth lessingia, and Mount Hamilton thistle in permanent plots on Coyote Ridge on the UTC parcel (Arcadis 2008).

Species status will be monitored over time in relation to baseline occurrence sizes; baseline data will serve as the standard against which future changes are measured. Monitoring will evaluate changes over time and the response of plant occurrences to management activities. At a minimum, monitoring will include data on occurrence size, numbers and location; age classes; seedling survival; health and vigor of occurrences, threats, and adjacent land uses. Location data will be collected by GPS and documented in GIS layers.

For some species, it may be important to separate individuals into stages (e.g., seedlings, adults, reproductive adults) to assess occurrence dynamics. In addition to the specified monitoring, monitoring will always be conducted following events that may have strong effects on occurrence size and condition (e.g., fire, severe weather, human impact). Monitoring methods will be based on up-to-date repeatable methods of tracking occurrence status over time.

## Evaluate Species Response to Habitat Enhancement

Several land management actions will be implemented under this Plan. In many areas these management activities are already occurring. For example, grazing is

an important part of grassland management in the study area. However, the manner in which reserve lands are grazed may change as the result of prescriptive management outlined in reserve unit management plans. In some areas, grazing may be reduced in favor of other management techniques such as prescribed fire.

In all such cases the impact of changes in management on covered plant occurrences will be tracked through occurrence monitoring. Management at the natural community level will be informed by information that is gathered during species-specific monitoring. Monitoring will be designed to facilitate quantification of how these management regimes change the number of individuals in an occurrence and/or the total number of occurrences. Additional data that could be collected to inform management decisions include the recruitment of seedlings in covered plant occurrences and changes in the species richness of natural communities surrounding covered plant occurrences. Ultimately, the findings of these monitoring activities should determine which management techniques are most effective at increasing covered plant occurrence levels in the Reserve System.

## **Targeted Studies**

A goal of monitoring under the Plan is to identify factors that limit the expansions of covered plant occurrences. Management actions will then be prescribed to remove or reduce those limitations; this process will be adaptively managed through follow-up surveys.

For some species, targeted studies will be conducted to evaluate the efficacy of establishing new occurrences by transplanting individuals from known occurrences or by seed collection and propagation. These created occurrences will be monitored and their success, as well as any impact that transplantation or seed collection has on known occurrences, will be recorded and incorporated into adaptive management decisions. In addition, the success rate of establishing individuals in new locations will be tracked to determine if this is a viable management option. The outcomes of these studies will be used to inform conservation actions for these species.

The Plan also prescribes some management actions for specific species, such as conducting experimental grazing exclusion for a small suite of plants. In all cases of specific management action implementation, appropriate monitoring protocols will be developed and carried out.

## **Monitor Additional Threats**

While fire is likely necessary for the propagation of some species, the effect of fire on covered species is not well understood at this time. Accordingly, covered plant occurrences will be monitored after fires. By monitoring the recovery period for natural communities that burn, as well as other variables such as

percent native versus nonnative species that reestablish, an assessment can be made of overall habitat quality and whether permanent changes in available habitat will affect the persistence of covered plant occurrences.

Mt. Hamilton thistle may face threats from the release of biological control agents (e.g., insect herbivores) that target related invasive thistles. If such releases are conducted in the study area, occurrences of Mt. Hamilton thistle on the Reserve System need to be monitored closely to determine whether there are any adverse effects on this covered species. However, initial monitoring does not show a significant effect on recruitment from biocontrol agents (Hillman 2007).

Additional monitoring may be necessary for covered plants (e.g., Loma Prieta hoita) that may be susceptible to feral pig rooting or damage by other invasive species. Covered plant occurrences near recreational trails will be monitored periodically for trampling or illegal collecting.

## San Joaquin Kit Fox (Group 3)

### Document and Monitor Species Status

Although state and federally listed, the San Joaquin kit fox is included in Group 3 because the study area is not considered a critical component of the species' range. Monitoring for San Joaquin kit fox will be difficult due to the very low numbers of individuals in the study area (or their absence in many years) and also to their presence primarily on private property. While some monitoring for kit fox will be conducted, as described below, most monitoring for this species will be conducted at the natural community level. For example, monitoring of grasslands, described above in the introduction to Section 7.3.3 *Species-Level Actions* will reveal how grassland communities are responding to grassland management under this Plan. Facilitating a net increase in native grassland communities within the Reserve System will provide more and better habitat for kit fox by increasing the prey base. Further, monitoring the connectivity of habitats within the study area through study of other more abundant species with similar long-distance dispersal behavior (e.g., coyote, bobcat, badger) will ultimately determine if the goal of increased habitat connectivity for kit fox has been achieved.

The San Joaquin kit fox *Level B Strategy* of the *Recovery Plan for Upland Species of the San Joaquin* identified a number of research needs to refine viability models and land-use optimization model (U.S. Fish and Wildlife Service 1998). In accordance with these research needs, a baseline survey of potential den sites will be conducted for modeled San Joaquin kit fox habitat (**Appendix D**) in the Reserve System. Potential den sites will be assessed for occupancy, and a schedule for follow-up monitoring will be established. Further, to assess how San Joaquin kit fox and other terrestrial species move across SR 152 (the most prominent barrier within the modeled San Joaquin kit fox habitat), a combination of trail cameras or track boards will be used at assumed crossing locations (e.g., bridges, culverts) to quantify wildlife corridor use. A

methods testing study will be conducted to identify methods for quantifying use of crossings by native species.

## **Evaluate Species Response to Habitat Enhancement**

It is assumed that monitoring efforts aimed at quantifying grassland community enhancement and connectivity will be suitable to assess kit fox habitat quality. For example, if grassland enhancement efforts are deemed successful at increasing the amount of grassland and overall connectivity in the Reserve System, then those efforts will be similarly successful for grassland-dependent species such as San Joaquin kit fox. The density and distribution of California ground squirrels in the Reserve System will also be used as a proxy for habitat quality and quantity for San Joaquin kit fox within the modeled range of the species. Baseline surveys to establish the distribution and burrow density of California ground squirrels in the Reserve System will be conducted, and that information will be used to refine the habitat model. Changes in distribution of California ground squirrels in response to grassland management will be considered changes in habitat availability for San Joaquin kit fox in areas modeled as San Joaquin kit fox range.

The Implementing Entity will also monitor the success of conservation actions focusing on removing fences, roads, and/or small culverts to increase habitat linkage for the kit fox by tracking more common indicator species. Indicator species will also be monitored to track the efficacy of fencing installed to direct movement toward linkages that are created or enhanced through Plan implementation.

## **Monitor Additional Threats**

Additional threats within the study area include SR 152, which bisects potential San Joaquin kit fox habitat. Other terrestrial mammals will be examined to evaluate how this and other roadways might be affecting habitat connectivity in the study area, because kit fox numbers are likely too low to reveal meaningful trends. How and where species move across these barriers and how those movement patterns change in response to crossing enhancement or roadway modifications will be assessed.

In addition, predation of nonnative red fox on San Joaquin kit fox will be examined as a threat.

Rapid changes in grassland habitat, such as natural or prescribed burns, could have a temporary effect on prey availability and cover for San Joaquin kit fox. To determine how the prey base is affected, California ground squirrel colonies will be monitored before and after fires occur. By monitoring the recovery period for grassland habitat, including ecosystem variables such as size of the reestablished ground squirrel colony, an assessment can be made of overall

habitat quality and whether permanent changes in grassland habitat will affect the occurrence or persistence of a San Joaquin kit fox population.

## **Least Bell's Vireo (Group 3)**

### **Document and Monitor Species Status**

Although state and federally listed, least Bell's vireo is included in Group 3 because the study area is not considered a critical component of the species' range. Surveys of riparian woodland within the Reserve System will be conducted. Initially, the Implementing Entity will document any nesting activity in the study area. Because least Bell's vireos have only been documented twice in the recent past (once nesting, once foraging), other songbird species (e.g., song sparrow, common yellowthroat, Wilson's warbler, black headed grosbeak) that nest in the understory of riparian woodland could be used as indicators of habitat quality until least Bell's vireos are documented nesting in the study area. The focus areas for least Bell's vireo will initially be the species' modeled habitat (**Appendix D**) within the Reserve System and on other public lands. Surveys along these stream reaches will characterize the songbird communities (also part of natural community monitoring) and detect any least Bell's vireos present during the nesting season. Species status will be based on presence in the Reserve System and other public lands. Monitoring will also occur at least every 5 years in targeted sites outside the vireo's modeled habitat in the study area to determine if it is expanding (in particular, in the northern portion of the County). These surveys would be done by the Implementing Entity. Through adaptive management, the vireo model would change in the future due to new information.

Surveys will consist of either standard point count or area search methods (Ralph et al. 1993) depending on the terrain and size of the reach. The nesting season for riparian songbirds is typically April 15–July 31 in the study area. The period with the highest potential to detect breeding least Bell's vireo is mid- to late May (Santa Clara Valley Audubon Society 2005). Locations of all singing males will be recorded using a GPS receiver, as will any nests or other evidence of breeding activity. During baseline surveys, the species habitat model will be modified to reflect riparian habitat quality and actual nesting habitat within the Reserve System. Subsequent surveys will be focused on those areas to monitor changes in the population.

### **Evaluate Species Response to Habitat Enhancement and Restoration**

Additional surveys conducted by the Implementing Entity will be focused along riparian corridors where changes in land use or stream flow, or stream or riparian restoration activities, are expected to occur. For example, stream flow below the two south County reservoirs may be altered to improve habitat for covered aquatic species in Uvas Creek. Those alterations could change the riparian vegetation in Uvas or Llagas Creek, making it more or less suitable for breeding

least Bell's vireo. The actual effects will be determined by monitoring breeding least Bell's vireo populations along these stream reaches, should they be present or, in their absence, by monitoring breeding populations of other riparian understory obligates. Some modifications to land use, such as excluding livestock from stream corridors or stabilizing sources of sediment, could also change the vegetative structure along stream reaches. Monitoring least Bell's vireo and other riparian obligate songbird species will offer insight into how these changes affect the function of the riparian community.

In an extreme case, restoring engineered channels to a more natural condition will change the songbird community using the drainages during the nesting season. In such an instance it will be important to collect at least 1 year of baseline data along the engineered channel against which to compare the restored channel. However, few such scenarios are anticipated in potential least Bell's vireo habitat within the Reserve System (one example is Upper Llagas Creek within Morgan Hill).

## **Monitor Additional Threats**

Currently there are limited threats to least Bell's vireo within the study area because populations are absent or very low. It is assumed that the distribution of the local population will continue to expand northward as it has in the recent past. Once a least Bell's vireo population is established in the study area, there could be additional threats to nests and adults. Studies to determine nest success will be conducted annually once nesting is detected in the study area. In addition to documenting nest success, these studies will document reasons for nest failure and incidence of brown-headed cowbird parasitism (a major threat in established populations in southern California). The results of these studies will inform management decisions to increase nest success in the study area. Potential management actions are listed below.

- Brown-headed cowbird control program.
- Feral cat removal or relocation.
- Native and/or nonnative predator control (e.g., red fox, raccoon, skunk).
- Restricted public access to important breeding areas during the nesting season.

## **Tricolored Blackbird (Group 3)**

### **Document and Monitor Species Status**

All suitable freshwater wetland or pond habitat within the Reserve System will be surveyed in accordance with the survey schedule described in the introduction to Section 7.3.3 *Species-Level Actions* to document the baseline estimate of the population size within the Reserve System. Because tricolored blackbird populations are rare in the study area, other potential wetland sites on other

public lands will be surveyed to document the species in the region. Baseline information for the species will comprise the components listed below.

- Location of occupied wetlands.
- Estimate of number of birds in colony.
- Assessment of nesting habitat quantity and quality (e.g., percent of native and nonnative plants).
- Assessment of any additional nearby threats (e.g., heron rookeries, sources of noise or other disturbance).

This information will be documented in GIS layers and used to prioritize areas for protection and enhancement or restoration/creation.

Once baseline data are collected, monitoring for tricolored blackbird colonies will be conducted during the breeding season. The population size of established colonies will be monitored, as will unoccupied wetlands in the study area. Tricolored blackbirds typically nest from early April through early June. Because the probability of detecting nesting colonies is highest during May, surveys will be conducted during or near the month of May. It is suggested that each colony be visited twice during the breeding season, preferably 10–14 days apart, to determine a range of breeding individuals at the colony, by at least two observers on the same day. The mean number of birds estimated by the two observers can be used to determine the size of the breeding colony. During the survey, the colony will be observed through binoculars or a spotting scope at a distance that will not change the behavior of the nesting birds. These proposed monitoring guidelines will be revised if better methodologies based on the best available scientific information are developed during implementation.

Once baseline data have been collected on breeding habitat availability in the Reserve System and existing breeding colonies have been documented, that information will be used to determine breeding habitat connectivity within the study area. This will identify areas where “new” breeding habitat will be created or acquired to ensure habitat connectivity for this species. Information will be collected on where new colonies become established, and identifying the surrounding land use patterns (e.g., agriculture, irrigated pasture) that provide foraging habitat for breeding tricolored blackbirds. Areas where this relationship can be preserved or created within the Reserve System will be identified and evaluated for future restoration or creation of habitat.

## **Evaluate Species Response to Habitat Enhancement, Restoration, or Creation**

Enhanced or restored wetland areas and suitable created ponds will be monitored twice from April to June to determine if a tricolored blackbird nesting colony is present or, if one is already established, to document its current size. In wetlands or ponds where there are existing tricolored blackbird colonies, all enhancement or restoration activities will be conducted outside the nesting season. Following

those management actions, the tricolored blackbird colony size will be monitored to determine the population response to the management actions. In target areas where tricolored blackbirds were not observed prior to management actions, subsequent surveys will document whether new colonies establish in the area.

## Monitor Additional Threats

In instances where tricolored blackbirds are nesting in nonnative plants (e.g., Himalayan blackberry), there is the risk that nonnative species control could result in the loss of nesting habitat. Accordingly, the removal of nonnative plant species will be weighed against the loss of important nesting habitat for this species. There should be attempts to transition the nonnative habitat to native habitat that will also support nesting tricolored blackbirds. The colony response to those actions will be monitored and the result will inform future management prescriptions for colony sites with nonnative plants.

In general it is difficult to monitor nest success of tricolored blackbird because while nesting they are very susceptible to disturbance. Some information about colony success can be gained through annual monitoring of colony size, but this approach often fails to identify specific stressors. There are assumptions that some species (e.g., feral cats) can have a deleterious effect on colonies. For colonies that are near urban areas, feral cat removal programs could increase the success of nesting tricolored blackbirds. Similarly, robust populations of nonnative red foxes or even native skunks and raccoons can have significant impacts on nesting birds. In general, control programs will not address native species. However, targeted programs could be initiated in response to observations of individuals taking nests, eggs, or nestlings.

## 7.4 Data and Reporting

Proper data management, analysis, and reporting are critical to the success of the monitoring and adaptive management program. Data on monitoring methods, results, and analysis must be managed, stored, and made available to Implementing Entity staff, decision makers, scientific advisors, Wildlife Agencies, other interested government agencies including the Corps and Regional Boards, and other appropriate persons. A database and clear reporting procedure are also required for permit compliance. The requirements for database development, maintenance, and data reporting for monitoring are described in Chapter 8 *Plan Implementation*. The reporting requirements for monitoring include the following (also found in Chapter 8):

- A description of the landscape-, natural community-, and species-level monitoring undertaken during the reporting period and a summary of monitoring results, including species status and trends.
- A description of the adaptive management process utilized during the reporting period (e.g., consultation with science advisors, convening of the Independent Conservation Assessment Team).

- A summary of the recommendations or advice provided by the Wildlife Agencies, science advisors, and the Independent Conservation Assessment Team (if applicable) regarding adaptive management and monitoring.
- A summary of the monitoring program objectives, techniques, and protocols including monitoring locations, variables measured, sampling frequency, timing, and duration, analysis methods, and who performed the analyses.
- An assessment of the efficacy of the monitoring and research program and recommended changes to the program based on interpretation of monitoring results and research findings.
- An assessment of the efficacy of habitat restoration and creation methods in achieving performance objectives and recommended changes to improve the efficacy of the methods.
- A description of all Habitat Plan directed studies undertaken during the reporting period; a summary of study results; and a description of integration with monitoring, assessment, and compliance elements.
- An assessment of the appropriateness of performance indicators and objectives (see **Table 7-2** for examples) based on the results of effectiveness monitoring, and recommended changes to performance indicators and objectives.
- A description of any actions taken or expected regarding changed circumstances, including remedial actions.
- A description of any unforeseen circumstances that arose and responses taken.

**Table 7-1.** Schedule of Monitoring Tasks over the Permit Term

<b>Monitoring Type/ Phase</b>	<b>Summary Tasks</b>
<b>Years 0–5</b>	
Compliance	Set up tracking databases for impacts, acquisition, and restoration to land cover, and covered-plant populations.
Inventory	<p>Initiate inventories in the Reserve System.</p> <p>Assess landscape linkages using aerial photos and ground surveys and initiate data – collection program on wildlife movement.</p> <p>Submit reserve unit management plans for Wildlife Agencies review and approval within 5 years of the first acquisition for each reserve unit. Each plan will contain a detailed monitoring and adaptive management plan; including the development of indicators, monitoring protocols, and success criteria for management actions.</p> <p>Prioritize conservation actions within the Plan area.</p>
Targeted Studies	<p>Develop ecological models for Group 1 species.</p> <p>Initiate methods testing for key management actions (e.g., restoration).</p> <p>Prioritize and initiate pilot projects.</p> <p>Prioritize and initiate directed studies.</p>
Long-Term Monitoring	Develop experimental design for long-term management activities such as restoration and include as part of reserve unit management plans.
<b>Years 6–15</b>	
Compliance	Continue tracking impacts, acquisition and restoration. Ensure that mitigation stays ahead of impacts.
Inventory	Continue baseline inventories as sites are added to the Reserve System.
Targeted Studies	<p>Complete methods testing and pilot projects.</p> <p>Continue directed studies.</p>
Long-Term Monitoring	<p>Update GIS layer (every 5 years) and assess trends.</p> <p>Monitor covered-species response to management actions.</p> <p>Monitor covered species in accordance with the schedule developed in the Habitat Plan and the final detailed monitoring and adaptive management plan.</p> <p>Monitor success of restoration sites against success criteria.</p> <p>Review existing literature and scientific knowledge and make changes to monitoring and management based on new information.</p>
<b>Years 16–25</b>	
Compliance	Continue tracking impacts, acquisition, and restoration. Ensure that mitigation stays ahead of impacts.
Inventory	Continue baseline inventories as additional parcels are acquired.
Targeted Studies	Complete targeted studies.

Monitoring Type/ Phase	Summary Tasks
Long-Term Monitoring	Continue to assess status and trends of natural communities (aerial surveys) and species.
	Adapt management actions based on monitoring results of species response and success criteria for restoration and other management efforts.
	Continue to monitor covered species and adaptively manage species in response to monitoring results.
	Evaluate efficacy of monitoring protocols using results of pilot projects.
<b>Years 25+</b>	
Compliance	Finalize impact tracking. Maintain database of any active ongoing mitigation.
Inventory	Finalize baseline inventories of parcels acquired after Year 25.
Long-Term Monitoring	Continue to assess status and trends of natural communities (aerial surveys) and species.
	Based on 25 years of implementation, develop reduced monitoring protocols for target species and/or communities.
	Promote directed studies in the reserve system that benefit covered species and natural communities.

**Table 7-2.** Example Success Criteria for Monitoring Effectiveness of Selected Management Actions<sup>a</sup>

Management Action	Performance Period <sup>1</sup>	Example Success Criteria	
		Example Minimum Value <sup>3</sup>	Example Target Value <sup>4</sup>
Enhance Wetlands and Ponds: ponds and perennial wetlands	___ years following acquisition of ponds and perennial wetlands	<i>Nonnative predators:</i> <ul style="list-style-type: none"> <li>• Maintain ___% of all ponds and permanent wetlands free of nonnative fish (except mosquitofish) and bullfrogs in any given year</li> </ul>	<i>Nonnative predators:</i> <ul style="list-style-type: none"> <li>• Maintain all ponds and permanent wetlands free of nonnative fish (except mosquitofish) and bullfrogs annually</li> </ul>

## Notes:

<sup>a</sup> This table provides a framework for evaluating the success of certain conservation measures. The Implementing Entity will develop values for assessing success during the Inventory and Targeted Studies phases of implementation

<sup>1</sup> The estimated period following enhancement/creation/restoration of a natural community at a site during which performance standards should be achieved.

<sup>2</sup> Success criteria are shown in italics.

<sup>3</sup> The example minimum value is the minimum measured value for each success criterion that must be achieved during the performance period.

<sup>4</sup> The example target value represents the optimal desired value for each performance indicator and the design and management objectives for enhanced/created/restored natural communities. If performance objectives are not achieved, adaptive management actions may be triggered.

<sup>5</sup> Acres restored are estimates based on the impact analysis. Actual restoration performance standard/target may vary depending on actual field-verified impacts.

<sup>6</sup> Normal rainfall years are defined as within 1 standard deviation of the annual average rainfall as measured at the California Irrigation Management Information System (CIMIS) \_\_\_ rain gauge over the hydrologic record of the gauge (October–September). Dry years are defined as less than 1 standard deviation from the annual mean.

Note: Density of line indicates intensity of work.

## Chapter 8

# Plan Implementation

### 8.1 Overview

Implementation of the Santa Clara Valley Habitat Plan begins when the Implementing Agreement is executed, the Section 10(a)(1)(B) incidental take permits and NCCP permit are issued, and the local ordinances take effect. Primary responsibility for Plan implementation rests with the Permittees. However, as described in this chapter, other groups are responsible for implementing some aspects of the Plan. The successful execution of the conservation strategy, monitoring program, covered activity approvals, and reporting that are part of the Plan require coordinated actions among the Permittees, Wildlife Agencies, public land managers, and the private sector.

This chapter describes the overall implementation policies of the Plan, including institutional arrangements, organizational structure, approval processes, land acquisition, and roles and responsibilities of signatories to the Implementing Agreement and other stakeholders.

### 8.2 Implementation Structure

Day-to-day implementation of the Habitat Plan will be managed by staff of the Implementing Entity. The Implementing Entity has the authority to delegate some of its responsibilities to other entities including government agencies and nongovernmental organizations, though the Implementing Entity is ultimately responsible for ensuring implementation of the Habitat Plan. Many existing organizations and agencies in the Santa Clara County area already have significant expertise and experience in performing the necessary functions of the Implementing Entity. The Implementing Entity may be able to more effectively and efficiently ensure implementation of the Habitat Plan by contracting with these existing institutions. However, the Implementing Entity will have the authority to directly implement all aspects of the Habitat Plan itself should this be necessary. Options that could be considered to implement some or all of the duties of the Implementing Entity include those listed below.

- Staff hired by the Implementing Entity and independent of other agencies.
- A land trust specifically formed to help implement the Plan.

- Contracts with existing organizations that have relevant experience and expertise, such as experience with land management or monitoring (e.g., Open Space Authority, County Parks).

Other organizations with important roles in Plan implementation include the Wildlife Agencies, other public and private land management organizations, science advisors, and the public. The roles, responsibilities, and relationships of each group are described below and illustrated in **Figure 8-1**. Unless otherwise stated, all obligations and responsibilities described in this chapter rest with the Permittees and the Implementing Entity.

## 8.2.1 Permittees

The following agencies will be Permittees under the Plan.

- City of Gilroy.
- City of Morgan Hill.
- City of San José.
- County of Santa Clara.
- Santa Clara Valley Water District.
- Santa Clara Valley Transportation Authority.
- The Implementing Entity.

It is expected that each of these agencies will be a Permittee on the ESA Section 10(a)(1)(B) incidental take permit and the NCCP Act permit providing authorization for take that occurs from their covered activities and from covered activities within their respective jurisdictions (Chapter 2). Each will also be a signatory to the Plan's Implementing Agreement. The Permittees will vest the responsibility for implementing the Plan to the Implementing Entity as described below. To that effect, the Implementing Entity will oversee implementation of the Plan on behalf of the Permittees. However, the Permittees will ultimately be responsible for compliance with all the terms and conditions of the Plan's permits and for the performance of the Implementing Entity. Each local jurisdiction will designate staff to advise the Implementing Entity on Habitat Plan implementation (**Figure 8-1**) and provide a point of contact at the local jurisdiction for the Plan.

Many applications for coverage under the Habitat Plan will be submitted by private project proponents in the participating cities and the County. Each of these jurisdictions will be responsible for confirming that a project within its jurisdiction is eligible for coverage and for determining the completeness of each project application as described in Chapter 6 and in Section 8.7 *Roles and Responsibilities in Reviewing Application for Take Authorization* below. If the project is eligible for coverage and the project proponent has complied with all application requirements and other relevant terms of the Habitat Plan as determined by the participating jurisdiction, the participating jurisdiction will grant take authorization under the Habitat Plan as part of its normal project

review process (e.g., grading permit issuance, EIR certification). Participating local jurisdictions will also be responsible for reporting the relevant details of approved projects to the Implementing Entity (for entry into the Habitat Plan database and for required reporting to the Wildlife Agencies), for monitoring developer compliance with the avoidance and minimization requirements specified in the applicable conservation measures (see Chapter 6), and for collecting fees.

## 8.2.2 Implementing Entity

The Implementing Entity, proposed to be called the Santa Clara Valley Habitat Agency, is responsible for executing the requirements of the Habitat Plan, the permits, and the Implementing Agreement. The Implementing Entity will hold title to lands or easements it purchases and will oversee cooperative agreements with other land management entities that own and/or manage reserves for the Implementing Entity as part of the Reserve System. The Implementing Entity may also provide funding to local land management agencies and land trusts for them to purchase land for the Reserve System. The Implementing Entity will provide funds for reserve management and monitoring to those agencies and organizations with whom it contracts for such services.

The Implementing Entity will also coordinate with science advisors, outside consultants, and other land management agencies to ensure adequate and coordinated Plan implementation. The Implementing Entity will include, as part of staff or contract resources, a network of scientists, administrators, and other specialists that oversee and carry out planning and design, habitat restoration, monitoring, and adaptive management programs. Staff for these positions may be hired by the Implementing Entity or their functions contracted out to existing local agencies, nonprofit organizations, or private consultants. The Implementing Entity will also coordinate with Wildlife Agencies on a monthly basis and provide the Wildlife Agencies with annual reports.

The Implementing Entity will be a Joint Powers Authority (JPA) composed of the Cities of Gilroy, Morgan Hill, and San José, and the County. The JPA is limited to the four participating jurisdictions because the Joint Exercise of Powers Act requires that a JPA can only exercise powers held by all the participating agencies. Of the participating agencies, only the four jurisdictions have the authority to adopt the Habitat Plan fees (see Chapter 9 for details). Because all of the Permittees are responsible for implementing the Habitat Plan, all of the Permittees will have a role in the Implementing Entity.

The Implementing Entity will have two decision-making bodies, a Governing Board and an Implementation Board, as described below.

## Implementing Entity Governing Board

The Governing Board of the Implementing Entity will be composed of two representatives of each of the four participating jurisdictions, for a total of eight members. Each representative will be an elected official from the participating jurisdiction. The Governing Board is responsible for the governance and administration of the Implementing Entity. It may delegate its authority to the Implementing Board except for two duties that must remain with the Governing Board: adoption and modification of Habitat Plan fees and the approval of the Implementing Entity's annual budget. The Governing Board will meet at least twice each year.

## Implementing Entity Implementation Board

The Implementation Board will have representation by all Permittees. The 11-member Implementation Board will have two representatives each from the Permittees except for VTA, which, per its request, will have one representative. For the Permittees with two representatives, one must be an elected official. The Implementation Board will meet at least once every two months. The responsibilities of the Implementation Board will include, but are not limited to the following.

- Reviewing and making recommendations to the Governing Board regarding the adoption or modification of fees.
- Review and making recommendations to the Governing Board of annual operating and capital budgets of the Implementing Entity.
- Making decisions regarding the appointment of the Administrative Director and the hiring of or contracting with other Implementing Entity staff, services, or equipment.
- Making decisions regarding property acquisition or conservation easement purchase.
- Reviewing and making recommendations to the Administrative Director regarding grants and other funding opportunities.
- Establishing any committees or subcommittees to help the Implementing Entity fulfill its duties.
- Review and approval of annual reports prior to submittal to the Wildlife Agencies.
- Review of special cases of covered activities not subject to the jurisdiction of a Permittee (e.g., Participating Special Entities; see Section 8.4 *Participating Special Entities* below).
- Review and approval of requests by Permittees or private project proponents to provide non-monetary compensation for impacts in lieu of fees (see Chapter 9 for these provisions).

- Resolution of disputes among Permittees regarding implementation of the Plan.

## Implementing Entity Administration

Implementation tasks include support of permanent and seasonal administrative and technical staff who will be responsible for overseeing and ensuring the day-to-day tasks of implementing the Habitat Plan “on the ground.” Some or all of the activities of day-to-day implementation may be delegated to and carried out by contract agencies (including Permittees), nonprofit organizations, or contractors that specialize in the necessary functions and duties.

Implementing tasks will also address Plan activities such as identifying and acquiring suitable conservation properties, conducting inventories and monitoring surveys on Habitat Plan reserves, managing lands in the Reserve System, restoring wetlands and streams, creating ponds, maintaining a database of relevant information, tracking land cover and habitat losses and conservation, and reporting all relevant information to the Wildlife Agencies annually. All responsibilities of the Implementing Entity are described below in Section 8.3 *Responsibilities of the Implementing Entity*.

The Implementing Entity will receive advice from the groups discussed in the following sections. The ultimate decisions for all day-to-day activities of the Plan rest with the Implementing Entity and its Implementation Board.

### 8.2.3 Other Land and Water Management Agencies

Local land and water management agencies other than the Permittees are also important to the Plan’s success. Habitat Plan reserves will often border existing parks or public lands owned by other public agencies or private land trusts.

Land and water managers from relevant local organizations will be invited to coordinate closely with the Implementing Entity to ensure that management actions are compatible and consistent across the region. Significant cost savings can be achieved by coordination of local land and water management agencies in undertaking joint management actions that are consistent with this Plan.

### 8.2.4 Technical Advisory Committee

Many of the land management tasks outlined in Chapter 5 are common to other land management agencies in the county. Therefore, the Implementing Entity would benefit from the advice and partnerships with other land management agencies to perform common tasks. The Implementing Entity will form a Technical Advisory Committee that includes reserve management staff of the

Implementing Entity, staff representing the Permittees, and possibly third party contractors or other partners. Representatives of the Wildlife Agencies will serve as members of the Technical Advisory Committee. Senior managers of other local land management agencies could be invited to participate to share best practices and resources. The Technical Advisory Committee would serve as a coordinating body to provide advice on land management, monitoring, and other Habitat Plan activities in the Reserve System. Biologists at Local Partner agencies could also serve as members of the Technical Advisory Committee, if appropriate. The frequency of meetings of the Technical Advisory Committee will be determined by the Implementing Entity based on need and the activities of the Plan. The Technical Advisory Committee may form subcommittees to address specific issues. The Technical Advisory Committee may sunset at the end of the permit term.

## 8.2.5 Wildlife Agencies

It is important that the Wildlife Agencies (i.e., USFWS and CDFG) remain as active participants in the implementation of the Habitat Plan. The Wildlife Agencies are responsible for providing guidance to the Implementing Entity and Permittees on how to fulfill the terms of the permits. The Wildlife Agencies also share responsibility to monitor Plan compliance and notify the Implementing Entity as soon as possible if the Plan is not being implemented to their satisfaction. Wildlife Agency staff will take an active role in Plan implementation through review and approval of draft reserve unit management plans and specific covered activities (see Section 8.7.3 for a complete list of covered activities that require additional Wildlife Agency review). The Wildlife Agencies will also review and approve all land acquisition proposals to ensure consistency with the Habitat Plan conservation strategy described in Chapter 5.

The Wildlife Agencies will also assist the Implementing Entity in attempting to secure state and federal funding for Plan implementation (see Chapters 9 and 10). It is expected that the Wildlife Agencies will periodically attend Governing Board and Implementation Board meetings to assist their efforts to ensure that the Plan remains in compliance. Representatives of these agencies will serve as advisory members to the Governing and Implementation Boards and the Technical Advisory Committee.

To ensure regular communication between the Implementing Entity and the Wildlife Agencies, the Implementing Entity will convene and facilitate regular coordination meetings with Wildlife Agency staff to keep them apprised of progress towards conservation goals and objectives, Plan compliance, funding, monitoring and adaptive management, and other relevant topics. Meeting frequency will vary but will likely be monthly or bi-monthly during the first several years of implementation to ensure close communication. These meetings will serve as a means for the Wildlife Agencies to provide advice to the Implementing Entity prior to implementation of key conservation actions such as land purchases, aquatic conservation, habitat restoration, and adaptive management and monitoring. The meeting will also serve as a forum to

troubleshoot issues that arise before they influence permit compliance. These meetings may be separate discussions or part of Technical Advisory Committee meetings.

As stated in Chapter 5, the Wildlife Agencies will review all draft reserve unit management plans and provide comments to the Implementing Entity within 60 days of receipt of these documents. The Implementing Entity will revise the draft plan based on the Wildlife Agencies' comments, if any, and will provide a revised draft to the Wildlife Agencies, which will have an additional 60-day review period. If an initial draft reserve unit management plan or any subsequent revised draft reserve unit management plan adequately addresses a Wildlife Agency's comments, the Wildlife Agency will so notify the Implementing Entity within 60 days, and the reserve unit management plan will be deemed to be approved by that Wildlife Agency for purposes of this Plan, the Implementing Agreement, and the permits. In addition, if a Wildlife Agency does not provide comments within 60 days after receiving the revised draft reserve unit management plan, the Wildlife Agency will thereafter be deemed to have approved the revised draft plan for purposes of this Plan, the Implementing Agreement, and the permits. The Implementing Entity will incorporate comments submitted by the Wildlife Agency after the 60-day period in the revised draft reserve unit management plan to the extent that the Implementing Entity determines the comments can be incorporated.

As stated in Chapter 5, the Wildlife Agencies will review all land acquisition proposals and provide comments to the Implementing Entity within 30 days of receipt of each of these documents. The Implementing Entity will incorporate changes to the documents and provide revised drafts to the Wildlife Agencies within 15 days. These deadlines are established to ensure the timely review and comment on the documents by Wildlife Agency staff and to enable the Implementing Entity to acquire land as soon as possible. If the Wildlife Agencies do not respond within 30 days, the Implementing Entity may proceed with the land acquisition.

A subset of the covered activities will require additional review and approval by the Wildlife Agencies to ensure that the covered activity is adequately defined, consistent with the Habitat Plan, and incorporates appropriate conditions of approval in Chapter 6. See Section 8.7.3 *Wildlife Agency Responsibilities* for more discussion of this responsibility. See Section 7.2.3 *Program Implementation* for the Wildlife Agencies' role in the implementation of the monitoring program.

## Dispute Resolution

The Implementing Entity and the Wildlife Agencies will strive at all times to work in good faith with each other to reach mutual agreement on key implementation tasks such as adaptive management, monitoring, and conservation actions. If disagreements arise that cannot be resolved easily, the Implementing Entity will follow the "meet and confer" dispute resolution process outlined in Section 6.6.1 of the Implementing Agreement, and if necessary, the

“elevation of dispute” process outlined in Section 6.6.2 of the Implementing Agreement (**Appendix B**).

## Permit Suspension or Revocation

The Wildlife Agencies have the ability in accordance with applicable State and Federal law to suspend or revoke all or part of the permits in the event that any of the Permittees are out of compliance with the Plan, the Implementing Agreement, or the permits. The USFWS has the ability to suspend or revoke all or part of the ESA permits if continuation of covered activities appreciably reduces the likelihood of the survival and recovery of the species in the wild<sup>1</sup>. CDFG has the ability to suspend or terminate all or part of the NCCP permit if revocation or termination is required to avoid jeopardizing the continued existence of that portion of a covered species’ (listed or non-listed) range that occurs within the Plan area and to fulfill a legal obligation of the CDFG under the NCCP Act<sup>2</sup>. If such a situation arises, the Wildlife Agencies will notify the Permittees of the actions they must take, if any, to prevent jeopardy to the listed species and maintain the permits, giving the Permittees a reasonable opportunity to implement such actions. See the Implementing Agreement for details.

If one or more of the permits are revoked, the Permittees have the obligation to fulfill all outstanding mitigation requirements, including management and monitoring of the Reserve System in perpetuity, for any take that occurs prior to the revocation. For example, if the Permittees were behind on compliance with the Stay-Ahead provision for land acquisition or restoration, they would be required to meet this obligation (see Section 16.7 of the Implementing Agreement for details [**Appendix B**]).

### 8.2.6 Scientific Review

The adaptive management process described in Chapter 7 requires that the Implementing Entity consult scientists outside of the Implementing Entity to help advise them on issues related to habitat management and monitoring (see also subheading *Structure of the Adaptive Management Decision-Making Process* below). Scientists with expertise in conservation biology, management of local natural communities and agricultural lands, and the ecology of covered species will be consulted by the Implementing Entity to provide input, as appropriate. The scientific expert’s primary function is to provide technical advice and help assemble the best available scientific data on reserve assembly, monitoring, and adaptive management. A separate group of scientists will be convened in an Independent Conservation Assessment Team to provide input on the overall Plan progress at least every five years. More detail on the structure, role, and schedule of this scientific input is provided in Chapter 7, Section 7.2.3 *Program*

<sup>1</sup> 50 Code of Federal Regulations Sections 13.28–13.29, 50 Code of Federal Regulations Sections 17.22(b)(8) and 17.32(b)(8).

<sup>2</sup> California Fish and Game Code Sections 2820 and 2823.

*Implementation* subheading *Independent Conservation Assessment Team*. Scientists may be consulted after the permit term to continue to provide advice on monitoring and adaptive management.

## 8.2.7 Public Input

Public input is fundamental to ensuring the success of and continuing support for the Plan throughout implementation. The NCCP Act requires that the Implementing Agreement provide for periodic reporting to the public on the progress of NCCP implementation. Meetings of the Governing Board and Implementation Board will be open to the public, and public comments will be solicited and heard at each meeting<sup>3</sup>. In addition, the public can contact the staff of the Implementing Entity to comment on various aspects of Plan implementation. All data and reports associated with the monitoring program for this Plan will be available to the public, with the exception of reports documenting surveys on private lands considered for acquisition or conservation easements not yet acquired by the Implementing Entity. Monitoring reports will also be posted on the Habitat Plan web site.

### Public Advisory Committee

The Implementing Entity will establish and appoint a public advisory committee to solicit input from stakeholders with interest in Plan implementation. The committee will advise the Implementing Entity. Staff from the Permittees should participate in public advisory committee meetings to help ensure broad coordination among those parties interested in and responsible for implementing the Plan. Meeting frequency will be determined by the Implementing Entity and the committee; quarterly meetings are recommended initially. Meetings will be open to the public. The committee may sunset at the end of the permit term.

The public advisory committee can provide input to the Governing and Implementation Boards, Technical Advisory Committee, and staff on all aspects of Plan implementation, with an emphasis on the following topics.

- Expenditure of funds for habitat conservation actions.
- The general application of conditions on covered activities (Chapter 6).
- Achieving the biological goals and objectives of the Plan.
- Operation of reserves, monitoring, and adaptive management.
- Technical information and expertise regarding monitoring, management, and restoration.
- Adherence to Plan commitments (e.g., No Surprises, neighboring landowner assurances).

<sup>3</sup> The Governing Board may need to also hold periodic closed-door sessions to discuss confidential items such as land transaction negotiations or legal matters.

## Annual Public Meeting

At least once annually, the Implementing Entity will convene a meeting to report on the progress of implementation directly to the public. The Implementing Entity will summarize habitat losses and gains, habitat restoration and creation, and management and monitoring accomplishments for the previous year. The meeting will provide an informal forum for the public to pose questions and provide comments directly to the Implementing Entity on the overall progress of Plan implementation. The annual public meeting may coincide with one of the regular Governing Board or Implementation Board meetings. Periodic formal review of Plan progress in a public forum may also be appropriate and could perhaps coincide with the 5-year conservation reviews by the Independent Conservation Assessment Team (see Section 7.2.3 *Program Implementation* subheading *Independent Conservation Assessment Team*).

## 8.3 Responsibilities of the Implementing Entity

The Implementing Entity is tasked with the actual implementation of the Plan. As described above, the Implementing Entity will be receiving advice on Plan compliance and implementation from a variety of sources, including the Wildlife Agencies, science advisors, and the public. The Implementing Entity will seriously consider all of this advice to implement the Plan effectively and cost-efficiently. The Wildlife Agencies have review and approval authority over certain components of implementation (e.g., land acquisition, reserve unit management plans, reservoir-specific dewatering plans, and major changes in monitoring and adaptive management). However, the ultimate decisions for Plan implementation and compliance with the permits, Implementing Agreement, and Habitat Plan rest with the Implementing Entity.

Although the Implementing Entity is responsible for all of these tasks, it may contract with a Permittee, other local organization, or consultants to perform one or more of their responsibilities. These responsibilities include but are not limited to those listed below.

### Administration

- Developing and maintaining annual budgets and work plans.
- Developing standardized forms and checklists for Application Package processing.
- Obtaining grants and other outside funding sources, including tracking and reporting grant compliance.
- Collecting Habitat Plan fees from Permittees directly for their covered activities or from participating jurisdictions after they collect fees from private project proponents (as described in Chapter 9).

- Receiving, managing, tracking, reporting, and expending funds to implement the Plan.
- Training staff of local jurisdictions to review applications for take authorization under the Plan. Assisting local jurisdictions to ensure that project proponents comply with the conditions on covered activities described in Chapter 6.
- Providing tools to the Permittees to support the application review process.
- Serving as the final arbiter of whether a project or activity is covered under the Plan.
- Administering the Neighboring Landowner Assurances program described in Chapter 10.
- Creating and maintaining a database to track Plan compliance, which includes 1) implementation of all conservation actions, 2) progress towards the biological goals and objectives, 3) implementation of the monitoring and adaptive management program, 4) implementation of conditions on covered activities, and 5) all impacts on land cover types, modeled habitat for covered species, occupied habitat for selected species, and covered plant occurrences.
- Creating and maintaining a database and models to support the evaluation of land acquisition opportunities and other conservation actions to meet the requirements of the Plan.
- Ensuring that conservation actions are being implemented roughly proportional in time and amount to the impacts on land cover types authorized under the Plan (e.g., see Section 8.6.1 *Stay-Ahead Provision*), and forecasting land acquisition needs in order to comply with the Stay-Ahead provision.
- Notifying the Permittees of the requirement to make the land in lieu of fee provision compulsory when the Plan is out of compliance or in jeopardy of being out of compliance with the Stay-Ahead provision, as well as notifying them when this requirement may be lifted (see Section 8.6.1 *Stay-Ahead Provision*). Land acquired must always meet the requirements of the Plan as described in Chapter 5.
- Calculating and publicizing the amounts of annual fee adjustments and distributing these calculations to the Permittees, in accordance with Chapter 9.
- Performing the periodic fee assessments described in Chapter 9.
- Convening regular meetings (i.e., Wildlife Agencies, Public Advisory Committee, Annual Meeting, Independent Conservation Assessment Team).
- Preparing the Annual Reports (see Section 8.10 *Data Tracking* below).

## Conservation Implementation

- Implementing all conservation actions described in Chapter 5 or coordinating with partners to implement conservation actions, and ensuring compliance with all Plan requirements.
- Researching land acquisition opportunities (fee title or conservation easement) to meet the requirements of the Plan.
- Negotiating and securing land and water acquisition or conservation easements with private landowners.
- Negotiating land acquisition or conservation easements in partnership with other organizations.
- Coordinating with Permittees to ensure that the Plan is implemented consistently and effectively.
- Reviewing offers of land in lieu of fees that may be made by project proponents (see Section 8.6.7 *Land Dedication In Lieu of Development Fee*) or conservation action in lieu of fees by a Permittee and making determinations on other implementation matters that require approval of the Implementing Entity, as specified in this Plan or the Implementing Agreement.
- Monitoring and enforcing, if necessary, landowner compliance with conservation easement terms<sup>4</sup>.
- Developing enforcement procedures for the Reserve System and individual reserves (e.g., public and pet access controls) that will be incorporated into the reserve unit management plans.
- Developing reserve unit management plans for groups of parcels that share common land cover types and habitats.
- Designing and implementing habitat enhancement, restoration, and creation projects and managing the affected areas in an adaptive management framework (see additional detail below). This task includes developing site-specific restoration management plans.
- Obtaining additional permits for site-specific projects in the Reserve System (e.g., wetlands permits and cultural resources compliance for restoration projects), as needed.
- Conducting outreach to landowners, local community groups and agencies, and the general public regarding the Plan and its goals.
- Developing and managing a volunteer program to provide an opportunity for the public to contribute to the successful implementation of the Plan.
- Periodic mapping of the study area to update the land cover maps and habitat models and calculations. Modeled habitat impacts (**Table 4-4**) and modeled

<sup>4</sup> Enforcement actions on private land under conservation easement for the Reserve System would be conducted by the Implementing Entity with assistance from the appropriate local jurisdiction. Enforcement actions on land in the Reserve System owned by a public agency would be conducted by that agency with assistance from the Implementing Entity.

habitat acquisition requirements (**Table 5-17**) will be tracked based on the most recent models available. Implementation of conditions described in Chapter 6 (e.g., species surveys) and the conservation strategy (Chapter 5) will be informed by the most current land cover maps and habitat models updated and maintained by the Implementing Entity as needed throughout the permit term.

- Coordinating and communicating with local land management agencies.
- Designing a scientifically valid monitoring program and monitoring habitat and species on reserves (see additional detail below and in Chapter 7), including site inventories, targeted studies, compliance monitoring, effectiveness monitoring, and status and trend monitoring.
- Monitoring changed circumstances identified in Chapter 10 that might arise and if they do, following the remedial measures and procedures outlined in Chapter 10.
- Developing partnerships with local academic institutions to help direct research towards management and monitoring needs of the Plan.
- Conducting or overseeing land and water management activities that are part of the conservation strategy.
- Monitoring and tracking land acquisition and other conservation actions within and adjacent to the study area performed by others to ensure coordination and compatibility with Plan actions.
- Developing and conducting educational programs for landowners and the public consistent with the conservation strategy.
- Ensuring involvement of the public, science advisors, interested agencies, and others in Plan implementation.

The Implementing Entity will utilize specialists as needed to ensure proper implementation of these tasks. Key functions and roles are described below and illustrated in **Figure 8-2**. The Implementing Entity will have several core staff members that are dedicated to Plan implementation, as described below.

### 8.3.2 Administrative Director

The administrative director would be a staff person dedicated to the Plan who reports to the Implementation Board and directs the activities of the Implementing Entity. The administrative director is responsible for implementing all of the tasks listed above, including periodic reporting to the Implementation Board. The administrative director will also oversee periodic reviews of the Permittees to ensure compliance with the terms of the permits, Implementing Agreement, and Plan on behalf of all Permittees. Finally, the administrative director will serve as the primary link between Implementing Entity staff, local jurisdictions, Wildlife Agencies, other decision makers, and the general public.

### **8.3.3 Science**

Scientific expertise is needed within the Implementing Entity to help direct all technical aspects of Plan implementation, including land and water management and the monitoring and adaptive management program. Implementing Entity staff or designees will collect and analyze data as required by the Plan, keep abreast of current scientific methods and concepts, and provide continuous oversight of the monitoring and adaptive management program (e.g., monitoring methods, study designs) to ensure that the Reserve System incorporates the most appropriate strategies with the latest technology and best management practices. The Implementing Entity will be responsible for communication with external scientists, including agency scientists and the larger conservation science community. The Implementing Entity must also encourage relationships with agency and academic scientists to facilitate collaborations that will contribute to the Plan's conservation goals.

### **8.3.4 Real Estate Activities**

The Implementing Entity conducts relevant financial and legal analyses to guide selection of parcels for the Reserve System, and conducts or manages appraisals and transactions. A specialist will be needed with expertise in real estate law, zoning, and local regulations to fulfill the fiduciary duties of the Implementing Entity for its properties. The Implementing Entity may work with other organizations who partner with it to acquire land to fulfill requirements of the Plan. Existing agencies may already have staff with these skills; the Implementing Entity could partner with such agencies to obtain these skills externally.

### **8.3.5 Grant Administration**

The Implementing Entity is responsible for managing all grants, contracts, and other funding sources during Plan implementation. The Implementing Entity must establish clear accounting procedures and methods for disbursing funds and actively pursue and acquire additional funding for Plan implementation. The Implementing Entity will actively write grant applications to secure these funds. The Implementing Entity may work with other organizations who partner with it to seek grants to fulfill Plan requirements. Existing agencies may already have staff with these skills; the Implementing Entity could partner with such agencies to obtain these skills externally. For any grants received, the Implementing Entity must also monitor, track, and report to the granting agency according to the grant requirements.

### **8.3.6 Budget Analysis**

The Implementing Entity is responsible for developing and monitoring budgets, processing invoices, managing financial reserves, identifying cost savings, and managing administrative contracts (e.g., liability insurance). The Implementing Entity must also track expenditures and cash flow and establish and maintain an internal accounting system and procedures.

### **8.3.7 GIS/Database Maintenance**

The Implementing Entity will use GIS or other equivalent spatially-explicit database systems to collect, store, and utilize relevant spatial data necessary for Plan implementation and maintain them to track compliance and to guide reserve design and monitoring and adaptive management programs. For example, the Implementing Entity must be able to query the database to summarize take and conservation by year (by land cover types, plant occurrences, and modeled habitat for covered species) and cumulatively. The Implementing Entity will track all data related to the progress of meeting Plan goals and objectives. The Implementing Entity will also ensure development and management of the public website for the Habitat Plan.

### **8.3.8 Reserve Management and Monitoring**

The Implementing Entity will direct the management of land acquired for the Reserve System and coordinate with managers of other protected areas to form a biologically cohesive network of protected lands in the study area. These activities will include regular patrol, trash removal, fence/gate installation and repair, road maintenance, and other necessary activities.

Some conservation actions that occur either in or outside the Reserve System may be performed by a Permittee. The Implementing Entity will coordinate with these Permittees and other local agencies to conduct conservation actions that it cannot perform itself or would perform less efficiently.

The Implementing Entity is responsible for developing reserve unit management plans for all units of the Reserve System to guide site-specific management (see Chapter 5). The Implementing Entity will develop site restoration plans (see Chapter 5), including designs and construction drawings, or will oversee contractors conducting these tasks. The Implementing Entity will also be responsible for interim management of acquired lands prior to completion of these reserve unit management plans.

The Implementing Entity is responsible for designing and implementing the monitoring and adaptive management program described in Chapter 7. The Permittees and the Implementing Entity are responsible for all management and monitoring on the Reserve System after the permits expire (i.e., in perpetuity).

## Management Conducted by Third Parties

The Implementing Entity may contract with a third party landowner, contractor, or other agency or organization to conduct management activities within the Reserve System on the Implementing Entity's behalf. Some of these management activities may result in take of covered species, as described in Chapter 4. To ensure that the third party manager adheres to the terms of the Habitat Plan, the permits, and the Implementing Agreement, the Implementing Entity will enter into a contract with this third party. The contract will specify the work to be performed, the applicable terms of the Habitat Plan and permits, and the take authorization that is extended to the third party, if applicable.

If a third party conducts land management on behalf of the Implementing Entity, another party must conduct the monitoring of those management activities to ensure independent assessment of the effectiveness of those actions.

## Structure of the Adaptive Management Decision-Making Process

Key to the success of the adaptive management program is a clear and effective structure for making decisions on the basis of new data from Plan monitoring and information from other sources. The organizational structure of the monitoring and adaptive management decision-making process is described in detail in Chapter 7 *Monitoring and Adaptive Management Program*. This structure has been designed to be efficient and agile in order to respond quickly to monitoring results or new scientific data.

In general, the Implementing Entity oversees the adaptive management and monitoring program. The Wildlife Agencies will provide input and help guide the program, but the Implementing Entity has ultimate responsibility for implementing the program and instituting changes through adaptive management. Additional responsibilities of the Implementing Entity include prioritizing management actions, disseminating information, developing annual and long-term work plans, and facilitating input from the public and outside scientists. The Administrative Director of the Implementing Entity will work with the Entity's science and management resources to implement the adaptive management and monitoring program. Reserve managers, who will be in charge of day-to-day activities within the reserves, will also contribute to annual work plans and formulate adaptive management recommendations for the Plan as a whole.

A pool of scientists will provide external input regarding implementation of the monitoring and adaptive management program. Input will be provided regularly or as needed to help guide monitoring protocols and experimental design, to interpret results and generate hypotheses, and to comment on the overall success of the monitoring and adaptive management program in achieving the biological goals of the Plan.

The Wildlife Agencies will provide feedback on the implementation of the adaptive management and monitoring program described in the annual work plans. Individuals with the Wildlife Agencies with particular expertise in management may also participate as science advisors. All forms of input will be collected by the Implementing Entity and incorporated into management and monitoring practices (see Chapter 7 *Monitoring and Adaptive Management Program* for more details). The Wildlife Agencies will have review and approval authority over major changes in the reserve unit management plans to ensure compliance with the permits, Implementing Agreement, and Habitat Plan.

An Independent Conservation Assessment Team will provide conservation reviews every 5 years. The scope of review for the Conservation Assessment Team will vary each time they are convened. The role of the Independent Conservation Assessment Team is described in detail in Chapter 7, Section 7.2.3 *Program Implementation* subheading *Independent Conservation Assessment Team*.

Local land managers will be invited to help guide Plan implementation as advisors to the Implementing Entity and the Implementation Board and these organizations will coordinate closely with the Implementing Entity. As mentioned above, these management agencies may wish to establish a formal committee to facilitate coordination and information sharing.

### **8.3.9 Public Outreach and Education**

As described in Chapter 5 (Section 5.3.2 *Landscape Conservation and Management*), the Implementing Entity will conduct outreach to local private and public landowners and residents that will include education on the management goals and objectives as well as implementation techniques. The focus of public education and outreach activities will be to raise landowner and public awareness of reserve management goals, actions and methods, and how the public can support them. To that end, the Implementing Entity will ensure development and management of a public web site for the Habitat Plan. Where appropriate, the Implementing Entity will develop and publish guidelines for local landowners and provide education programs to assist in the implementation of these guidelines. Public education and outreach will be coordinated with other local agencies providing similar services in the study area (e.g., County Parks, SCVWD, and Open Space Authority).

### **8.3.10 Legal and Financial Services**

Legal counsel will provide guidance during Plan implementation on an as-needed basis for drafting and reviewing conservation easements, reviewing land purchases, assisting with land transaction negotiations, assisting with legal challenges, and assisting with easement violations if they occur. To the extent possible, in-house attorneys for the Permittees may provide legal counsel to the

Implementing Entity. However, certain circumstances may require specialized third-party legal assistance.

Financial analysis assistance will be required periodically to review the program's cost/revenue balance and ensure that development fees are adjusted with changing land costs and inflation.

### **8.3.11 Consultants and Contractors**

Consultants will be retained to meet any technical or scientific needs that cannot be effectively or efficiently addressed through in-house staff due to insufficient expertise or availability. It is expected that consultants will be utilized more heavily during the early stages of Plan implementation, becoming less necessary as the Implementing Entity develops and becomes more familiar with the Reserve System. Contractors will be needed for construction tasks within the Reserve System requiring specialized skills or the use of heavy equipment, such as road grading, restoration grading, plant propagation, restoration planting, building recreational facilities, and water-well construction and maintenance.

### **8.3.12 Responsibilities of the Local Jurisdictions**

The local jurisdictions with land use planning and development review and decision-making authority participating in this Plan (Cities of Morgan Hill, Gilroy, San José; County of Santa Clara) have a special responsibility to assist with implementation because of their authorities as local governments. As Permittees and members of the Implementing Entity, the participating local jurisdictions will support Plan implementation by:

- Receiving, reviewing, and approving applications for take authorization under the Plan from private project proponents according to the procedures and requirements described in Chapter 6.
- Requiring private project proponents to pay Habitat Plan fees established by the Implementing Entity (see Section 8.5 *Local Implementing Ordinances*) and as described in Chapter 9.
- Periodically, and at least annually, transferring the Habitat Plan fees to the Implementing Entity to support Plan implementation.
- Reporting, at least annually, to the Implementing Entity the applications and approvals for take authorization under the Plan, including take associated with projects exempt from fees and/or conditions of this Plan.
- Monitoring the implementation of conditions on covered activities on project sites.
- Participating in the Implementing Entity's Technical Advisory Committee.
- Coordinating closely with the Implementing Entity regarding Plan implementation.

## 8.4 Participating Special Entities

Public or quasi-public entities, such as special districts or entities not subject to the jurisdiction of the Permittees, may conduct or initiate projects or ongoing activities within the permit area that could affect listed species and that may require take authorization from USFWS and/or CDFG. Such organizations may include existing or future school districts, water districts, irrigation districts, transportation agencies, local park districts, geologic hazard abatement districts, or other utilities or special districts that own land or provide public services. These public agencies, known as Participating Special Entities, can request coverage under the Plan during Plan implementation; such coverage would provide take authorization for their projects<sup>5</sup>. Municipalities that are not a Permittee are not eligible to participate using this status<sup>6</sup>. The following is a partial list of special districts that occur in the permit area and that could be eligible as a Participating Special Entity provided they meet the criteria described below.

- Community College Districts
- K-12 School Districts.
- Burbank Sanitary District.
- Central Fire Protection District.
- County Library Service Area 1.
- County Sanitation District No. 2-3.
- Guadalupe Coyote Resource Conservation District.
- Loma Prieta Resource Conservation District.
- Pacific Gas and Electric Company.
- Pacheco Pass Water District.
- Pacheco Storm Drainage & Maintenance District.
- San Martin County Water.
- West San Martin Water Company.
- Santa Clara County Lighting Service Area.
- Santa Clara County Open Space Authority.
- Santa Clara County Vector Control District.
- South County Regional Wastewater Authority.
- South Santa Clara County Fire Protection District.
- South Santa Clara Valley Memorial District.

<sup>5</sup> Private entities may be able to opt-in to the Plan through a separate process described in Section 6.7.2 *Application Process for Private Projects*.

<sup>6</sup> To join the Plan, a city or county would need to amend the Plan using the process described in Chapter 10.

- Sunol Sanitary District.

The Participating Special Entity will submit a complete application for the proposed activity directly to the Implementing Entity with copies to the local jurisdiction in which the project occurs, and the Wildlife Agencies. This application will contain the following components.

- A detailed description of and rationale for the activity proposed for coverage under the Habitat Plan.
- Proposed avoidance and minimization measures to be applied to the covered activity (see Chapter 6).
- A map of the proposed activity area.
- An analysis of the potential impacts of the proposed activity on covered species and their habitats.
- All components of the Habitat Plan application package (described in Chapter 6).
- In order to grant take authorization to these local agencies, the Implementing Entity will need a legally enforceable contractual relationship with the Participating Special Entity. The Implementing Entity will issue, at its discretion, a Certificate of Inclusion to the Participating Special Entity that will allow the proposed activity to be covered under the Habitat Plan if it finds that the conditions listed below are met.
- The Implementing Entity signs a contract with the Participating Special Entity binding it to the relevant terms of the permits, Implementing Agreement, and Habitat Plan<sup>7</sup>.
- The proposed activity complies with all terms and requirements of the Plan, the permits, and the Implementing Agreement, and the Wildlife Agencies concur.
- The impacts of the proposed activity fall within those analyzed in the Habitat Plan, the ESA Section 7 biological opinion for the Habitat Plan, and the EIR/EIS in general type, location, magnitude, and effects.
- The impacts of the proposed activity do not deplete the amount of take coverage to such an extent that not enough is available for future covered activities.
- The proposed activity does not conflict with the conservation strategy or the ability of the Implementing Entity to meet the Plan goals and objectives.

As described above, the Wildlife Agencies must approve the inclusion of the Participating Special Entities.

The Certificate of Inclusion will be issued to the Participating Special Entity by the Implementing Entity upon payment of the fee specified in the contract and completion of any other steps required by contract to occur prior to issuance of

---

<sup>7</sup> In the event of failure to uphold the terms of the permit, Implementing Agreement, and Habitat Plan, the contract gives the Implementing Entity the ability to force action by the Participating Special Entity through legal means.

the Certificate of Inclusion. The Implementing Entity may require Participating Special Entities to pay fees over and above those specified in Chapter 9 to cover indirect costs of extending permit coverage under the Habitat Plan, including the costs of Implementing Entity staff time to assist with permit coverage, a portion of the costs of the initial preparation of the Plan, and a portion of the costs of conservation actions designed to contribute to species recovery. The Certificate of Inclusion will include an attached map depicting the parcel number, acreage, and owner of lands to which the take authorization(s) would apply. A template of the Certificate of Inclusion will be provided to the Wildlife Agencies for review and approval during Plan implementation, before the first Participating Special Entity is approved. Also see the Implementing Agreement for additional details and procedures that apply to Participating Special Entities. The Implementing Entity will track the amount of take authorization extended to Participating Special Entities against the total allowable take authorized under this Plan.

As described in Chapter 4, some management and monitoring activities will result in take of the covered species, even if the net result of the actions are beneficial (e.g., prescribed burning, handling species to identify or mark them). Any special district or other agency that carries out such activities on behalf of the Implementing Entity will require take authorization. If the special district or agency is either a Permittee itself, or carries out management and monitoring activities on Plan preserves as a contractor of the Implementing Entity, it will receive take authorization under the Habitat Plan permits. Management or monitoring agencies that are not a Permittee or a contractor of the Implementing Entity can secure take authorization as a Participating Special Entity.

### **8.4.1 San Martin**

The unincorporated community of San Martin, located between Gilroy and Morgan Hill, has been interested for several years in incorporating as a new jurisdiction. If this occurs during the permit term, a new town of San Martin would not be covered by the permits. To allow use of the Habitat Plan by a new jurisdiction in the permit area, the Permittees would need to amend the permits, the Plan, and the Implementing Agreement to include this new jurisdiction. The Habitat Plan already anticipates growth within San Martin as part of County jurisdiction. If future growth plans of a new jurisdiction of San Martin are consistent with the impacts anticipated in the Habitat Plan, a Plan amendment is expected to be straightforward. Any new jurisdiction would not be able to use the Participating Special Entity process for take coverage under the Plan.

## **8.5 Local Implementing Ordinances**

To implement the Habitat Plan on the local level, each participating jurisdiction must adopt an implementing ordinance that will reference the permits, Implementing Agreement, and Habitat Plan and the jurisdiction's obligations under the Plan. Ordinances will be considered for adoption by each jurisdiction

no later than 120 days after execution of the Implementing Agreement and issuance of the last permit by the Wildlife Agencies. A draft template for a Habitat Plan implementing ordinance is provided in **Appendix B** as an attachment to the Implementing Agreement.

The permits will be contingent upon the adoption of local implementing ordinances in Gilroy, Morgan Hill, San José, and the County. The Implementing Agreement and permits will specify that the permit is contingent upon the adoption of these implementing ordinances. This will allow the Wildlife Agencies to make a finding that the Plan is adequately funded, contingent upon the adoption of the implementing ordinances.

## 8.6 Land Acquisition

The Implementing Entity is responsible for ensuring acquisition of land for the Reserve System in accordance with the requirements in Chapter 5 (summarized in the Acquisition Actions in **Table 5-2a**). As described in Chapter 5, all land for the Reserve System must be acquired by Year 45 of the permit term. To be incorporated into the Reserve System and count toward the land acquisition requirements of the Plan, acquired lands must meet the following criteria.

- Contribute to meeting the goals and objectives of the Plan and overall success of the Habitat Plan as described in Chapter 5.
- Have a location, configuration, and quality consistent with the reserve design and assembly principles in Chapter 5, Section 5.2.3 *Reserve System*.
- Land acquired must meet multiple criteria in Chapter 5 for landscape linkages, land cover types, plant occurrences, modeled species habitat, selected wildlife species occupancy, and other land acquisition criteria.
- Permanently protect the biological functions and values that contribute to the Plan. Permanent protection must be ensured through a conservation easement consistent with the requirements of Section 8.6.3 *Conservation Easement* or by some other permanent dedication of land to the Reserve System<sup>8</sup>.
- Be managed in perpetuity according to a reserve unit management plan as described in Chapter 5, Section 5.2.5 *Land Management*. Acquisitions may be counted toward meeting the obligations of the Plan before the reserve unit management plan has been completed if the Implementing Entity owns the land or if the property owner is bound by a conservation easement or other agreement that requires preparation of a management plan consistent with the requirements of the Plan. Management in perpetuity will be ensured through the conservation easement or title record.
- Be monitored according to the requirements and guidelines in Chapter 7.

<sup>8</sup> For example, as described in Chapter 9, Section 9.4.2, up to 1,000 acres of the Reserve System may be met by incorporation of existing Open Space Authority lands that qualify as Type 1 open space. Some or all of these lands may be incorporated without conservation easements; see Section 9.4.2 for details.

- Have no hazardous materials or property encumbrances that conflict with Habitat Plan goals and objectives.
- Is not mitigation for a project or activity that is not covered by the Plan.

The land acquisition process will follow the steps listed below for land acquired in fee title or through conservation easements. All Permittees will have the opportunity to review land acquisition proposals as part of the Implementing Entity. Steps 1 through 16 apply if the Implementing Entity initiates contact with potential landowners. Steps 3 through 16 apply if a landowner contacts the Implementing Entity. These steps are also illustrated in **Figure 8-3**. The Implementing Entity could perform these steps on its own or they could be accomplished by an acquisition partner (e.g., a local land management agency).

1. Identify sites that have the potential to meet acquisition requirements for particular land cover types, plant occurrences, landscape linkages, or Conservation Analysis Zones, or to support suitable and occupied habitat for covered wildlife.
2. Approach property owner with proposal to acquire land through conservation easement or fee title.
3. If property owner is willing, secure concurrence from owner for pre-acquisition assessment of site. If a site visit is not feasible, conduct pre-acquisition assessment of site based on air photo analysis and available regional data sets (e.g., Habitat Plan data, CNDDDB, etc.).
4. Conduct necessary pre-acquisition assessment at the Implementing Entity's expense of land cover types, habitat for covered species, and presence of covered species. The Implementing Entity will develop standard protocols and a report template for pre-acquisition assessment prior to the first acquisition during implementation.
5. Determine if site meets Plan acquisition requirements. Through the due diligence process, ensure that property encumbrances (e.g., existing easements, rights-of-way, property title, resource extraction rights, presence of hazardous materials or archaeological or cultural sites) do not conflict with Plan goals and objectives. For easements, reach agreement on easement terms and any necessary management prior to purchase, where possible. Areas subject to incompatible easements or management will be excluded from the reserve system until those incompatibilities are resolved.
6. Discuss proposal to acquire property with Wildlife Agencies at a Technical Advisory Committee meeting or other venue (discussions may need to be confidential). The Implementing Entity will discuss land acquisition proposals with the Wildlife Agencies early in the process.
7. Conduct appraisal of property value (easement or fee) and water rights consistent with legal requirements for acquisition of public lands.
8. Rank available sites on the basis of cost versus ability to meet Plan requirements and biological goals and objectives. Sites that meet specific requirements, goals, and objectives that are generally difficult to fulfill should be assigned a high priority.

9. Obtain concurrence from CDFG and USFWS for all land acquisition. Wildlife Agencies have 30 days to respond to request for approval once all relevant and available information has been provided to them. If after 30 days there has been no response from an agency, the Implementing Entity will assume approval from that agency.
10. For high-ranking sites, make offer to property owner and develop easement conditions, if appropriate. Easement conditions should contain the framework of the expected management of the site that will be documented in more detail later in the reserve unit management plan.
11. Negotiate fair-market price and easement conditions, if applicable, with owner.
12. If a site is purchased in fee title, the Implementing Entity will prepare a reserve unit management plan for the site based on site conditions if the site is the first parcel in the reserve unit (see Chapter 5 for the six units). If the site is part of an existing reserve unit, the reserve unit management plan will need to be updated to incorporate the new site. If a conservation easement is purchased, the Implementing Entity will prepare a management plan with the landowner (although easement negotiations may resolve some management issues). Management plans will be consistent with the Plan's conservation strategy and the framework for adaptive management.
13. Examine all leases that apply to the property for consistency with Plan goals and objectives. Inconsistent leases may be terminated or modified to conform with the Plan. Areas subject to incompatible leases will be excluded from the Reserve System until these leases expire.
14. If acquired in fee title, assess structures and facilities on the property for hazards, covered species, and other values such as educational purposes, land management facility, or cultural or historic significance. Repair or demolish structures or facilities, as appropriate, to reduce public hazards or stabilize functions (e.g., repair of gates and fencing).
15. Initiate reserve management and monitoring according to approved reserve unit management plan.
16. Conduct habitat restoration, if applicable.

## 8.6.1 Stay-Ahead Provision

The conservation strategy of an NCCP must be implemented at or faster than the rate at which impacts on habitat or covered species occur so that conservation always stays ahead of impacts and rough proportionality is maintained between impacts on habitats or covered species and conservation measures (California Fish and Game Code 2820(b)(3)(B)). The rough proportionality standard of the NCCP Act states that

“...implementation of mitigation and conservation measures on a plan basis is roughly proportional in time and extent to the impact on habitat or covered species authorized under the plan. These

provisions shall identify the conservation measures, including assembly of reserves where appropriate and implementation of monitoring and management activities, that will be maintained or carried out in rough proportion to the impact on habitat or covered species and the measurements that will be used to determine if this is occurring” (California Fish and Game Code 2820(b)(3)(D)(9)).

Similarly, the ESA also requires that HCPs minimize and mitigate the impacts of the taking to the maximum extent practicable (ESA Section 10(a)(2)(B)(ii)). When conducting their jeopardy analyses, USFWS will consider whether the mitigation proposed is scientifically and rationally related to the impact of the taking. In order to make findings that the proposed impacts are mitigated to the maximum extent practicable, USFWS will consider temporal losses (if any) resulting from the time of impact relative to the time of mitigation.

The *Stay-Ahead provision* requires that the amount of each land cover type conserved, restored, or created by the Implementing Entity as a proportion of the total requirement for each land cover type (**Tables 5-11 and 5-13**) must be roughly proportional to the impact on that land cover type as a proportion of the total impact expected by all covered activities (**Table 4-2**). For example, if 25% of the expected impacts on mixed serpentine chaparral have occurred, then at least 25% of the required land acquisition for mixed serpentine chaparral must also have occurred.

To provide flexibility during implementation, the Implementing Entity may fall behind by a maximum of 10% of its conservation strategy requirements (conservation overall and by each applicable land cover type) and still be in compliance with the Stay-Ahead provision for this Plan. This deviation accounts for the likely pattern of infrequent land acquisition of large parcels that will allow the Implementing Entity to jump far ahead of impacts with just one acquisition. **Figure 8-4** illustrates how the Stay-Ahead provision works for land acquisition in two theoretical cases. **Figure 8-4a** shows the pattern of land acquisition required if the rate of impact occurs at a constant rate throughout the permit term. **Figure 8-4b** illustrates how conservation must occur quickly if impacts occur during the beginning of the permit term. In both cases, the Implementing Entity is allowed a 10% deviation from the required trajectory of conservation. However, once the permits end (i.e., through expiration, suspension, revocation), the Permittees will be held responsible for any outstanding requirements in the permits, Implementing Agreement, and Habitat Plan (see the Implementing Agreement for a detailed discussion).

The Stay-Ahead provision also includes a requirement for acquisition of covered plant occurrences to stay ahead of impacts to these species (**Table 5-16**)<sup>9</sup>. The Stay-Ahead provision applies to each covered plant species separately (i.e., impacts to and conservation of covered plant occurrences cannot be aggregated for purposes of Stay-Ahead).

<sup>9</sup> Exceptions to this are described for the Coyote ceanothus in Chapter 5, Section 5.4.11.

## Measurement of Stay-Ahead Provision

During the first year after permit issuance, the Implementing Entity will be establishing its structure, collecting initial Habitat Plan fees, and actively pursuing land acquisition deals with willing landowners. To allow time for these start-up tasks to occur, the Stay-Ahead provision will only apply two years after the last local ordinance takes effect. After two years of Plan implementation, the Implementing Entity must measure its compliance with the Stay-Ahead provision by the following method. To measure compliance with the Stay-Ahead provision, land cover types are aggregated by natural communities (see groupings in **Table 3-1**). The amount of each natural community conserved, restored, or created as a proportion of the total requirement by natural community must be equal to or greater than the impact on the natural community as a proportion of the total impact expected by all covered activities. For example, if 40% of the total expected impacts on oak woodland land cover types have occurred, then at least 40% of the conservation of all oak woodland land cover types must also occur. This method of aggregating land cover types only applies to the measurement of the Stay-Ahead provision (requirements for acquisition by each land cover type [Tables 5-11 and 5-12] still apply and must be met by Year 45 of the permit term or by Year 40 if restoration or creation are to occur). This aggregation method provides incentives and flexibility to the Implementing Entity to acquire, restore, or create the most sensitive and difficult land cover types first within each natural community, even if impacts to these land cover types have not yet occurred.

Land acquired or funded in full or in part by state or federal agencies to contribute to species recovery under this Plan will also contribute to compliance with the Stay-Ahead provision. A portion of the Plan assumes funding by the state and federal governments. The Implementing Entity must recognize, however, that funds from public agencies will be available on budget cycles, and subject to administrative processes, that may or may not correspond to the timing of covered activities. Therefore, the Implementing Entity must acquire land and implement other conservation actions on its own and cannot rely on the timely availability of state or federal funds to implement these actions.

The Implementing Entity will monitor the status of the Stay-Ahead provision throughout Plan implementation. The Stay-Ahead provision will also be evaluated on an annual basis by the Wildlife Agencies. Beginning with the Year 2 annual report, the Implementing Entity will report on the status of the Stay-Ahead provision. As long as the pace of conservation measure implementation (i.e., preservation, restoration, or creation) does not fall behind the pace of covered activity impacts by more than 10% , the Stay-Ahead provision will have been satisfied.

If the Plan is found to be out of compliance with the Stay-Ahead provision, the Wildlife Agencies will determine if the Plan has maintained rough proportionality. If any of the Wildlife Agencies issue a notification to the Implementing Entity that rough proportionality has not been met, then the Wildlife Agencies and the Implementing Entity will meet to develop a plan to remedy the situation.

## Land Acquisition and Restoration Credit

The criteria for incorporating land into the Reserve System are described above. Land may be counted toward Plan requirements and the Stay-Ahead provision once it is incorporated into the Reserve System and if the lands are compatible with Plan goals and objectives. Infrastructure described as part of the Reserve System in Section 2.3.8 *Conservation Strategy Implementation* is assumed to be compatible with the Plan goals and objectives if it is implemented consistent with the conditions on covered activities described in Chapter 6, including Condition 9 *Prepare and Implement a Recreation Plan*. Existing and newly constructed infrastructure within the Reserve System does not count toward land cover type land acquisition requirements described in Chapter 5, but it does count toward the total Reserve System size requirements.

Compliance for land cover types for which restoration or creation are required will be measured when construction is completed. However, if the project fails to meet the success criteria developed during implementation for each site, the compliance credit will be revoked.

The Implementing Entity will receive credit for existing wetland land cover types that are part of the Reserve System except where wetland functions are degraded by their proximity to urban development. The thresholds for wetland preservation credit are described in Chapter 5 and in **Table 5-15**.

A key requirement of the land acquisition strategy is landscape connectivity and connections to existing open space. Land acquired early in the permit term may be isolated from existing open space until future acquisitions can connect it. Such acquisitions are eligible for credit under the Plan and for the Stay-Ahead provision. If it is clear later in the permit term that land acquired, in part, for connectivity purposes cannot be connected to existing Types 1–3 open space, compliance credit under the Plan will be revoked for the linkage requirement (other credit will remain).

Any rights-of-way or utility easements that are maintained or used regularly cannot be credited towards land acquisition requirements because of the disturbance that occurs within these areas. It is the responsibility of the Implementing Entity to document the frequency and type of use in these rights-of-way or easements to justify whether land acquisition credit should be applied in these areas.

Land cover restored or created can receive credit for restoration or creation and preservation (see Chapter 5 for land cover restoration and creation requirements, and how credit is applied). If the restoration/creation project occurs after recordation of the conservation easement (i.e., after preservation credit is assigned), the acreage of the restoration/creation project will be subtracted from the preserved land cover types that the project replaces. For example, a site that supports 100 acres of annual grassland is preserved by the Implementing Entity. When the conservation easement is recorded, the Implementing Entity receives 100 acres of annual grassland credit towards the preservation requirements of the Plan. Five years later, a 1-acre pond is created on the site. When the pond

restoration project is completed (i.e., when construction is complete), 1 acre is subtracted from the annual grassland preservation credit for the site and applied to pond creation and preservation.

The Implementing Entity must document the conditions of the restoration site prior to initiating restoration in order to determine whether the project is enhancing or restoring the wetland according to the definitions in the Plan (see **Appendix A**). If the site is being enhanced, then only preservation credit can be applied. If the site meets the definition of restoration, then restoration and preservation credit can be applied.

Wetland restoration credit may change if the wetland type changes (e.g., a pond becoming a perennial wetland if cattails colonize and dominate the site) before success criteria are met. Final restoration and creation credit will be determined once the success criteria of the restoration project are met. In no cases will the total amount of credit exceed the ground area present.

The Plan makes sharp distinctions between some land cover types when, in reality in the field, there are often gradual gradients between land cover types. In cases where it is difficult to draw a boundary between land cover types, a qualified biologist or botanist will identify each land cover type based on field conditions and professional judgment.

## Stay-Ahead Reporting and Process for Addressing Deficits in Land Conservation

The Implementing Entity will report the status of the Stay-Ahead provision in each annual report, beginning with the second annual report. If the Stay-Ahead provision is not met, the Implementing Entity and the Wildlife Agencies will meet and confer within 30 days of the annual report to assess the situation and develop and implement a mutually agreeable plan of action as described in the land acquisition actions (see Section 5.3.1 *Land Acquisition and Restoration Actions* in Chapter 5) and the Implementing Agreement to remedy the situation and achieve compliance with the Stay-Ahead provision. The mutually agreeable plan of action may include a range of potential solutions, including those listed below.

- Wait for key pending land acquisition deals to close that will bring the Plan into compliance with the Stay-Ahead provision.
- Speed delivery of funding sources or partnerships that will enable more land acquisition to bring the Plan into compliance with the Stay-Ahead provision.
- More aggressively solicit interest from key landowners who may be willing to sell land to the Implementing Entity that would enable compliance with the Stay-Ahead provision.
- Change the manner in which the Plan is implemented such as more direct acquisition of land by the Implementing Entity rather than relying on partnerships, shifting the Implementing Entity's budget allocations to place a

higher priority on land acquisition, or accelerating the process for being able to count land already acquired against Stay-Ahead requirements by, for example, recording easements more quickly.

- Require that project proponents provide land in lieu of fees (see below).
- Temporarily or permanently adjusting certain Plan provisions through an amendment or other process (e.g., the method for measuring compliance with the Stay-Ahead provision), with the approval of the Wildlife Agencies.
- Slowing or stopping take authorizations until conservation strategy obligations catch up with impacts.
- If, after the exercise of all available authority and utilization of all available resources, the Implementing Entity cannot comply with the Stay-Ahead provision, the Plan will be reevaluated, and an amendment may be warranted if adjustments to the take authorization, permit term, conservation obligations, or other aspects of the permits, Implementing Agreement, or Plan are necessary. See below for more information on the land in lieu of fee requirement when the Stay-Ahead provision is not being satisfied or is at risk of not being satisfied.

## **Requirements for Providing Land Instead of Paying a Fee When Stay-Ahead Provision Is Not Being Met**

If the Implementing Entity determines the Plan is at risk of noncompliance with the Stay-Ahead provision, the Implementing Entity will notify the Permittees. The Implementing Entity may determine that it is necessary to temporarily require project proponents (including Permittees) to provide land (or perform equivalent conservation actions in Chapter 5) instead of paying a fee. However, if the Stay-Ahead provision is not satisfied based on the criteria discussed above, the Implementing Entity must notify the other Permittees that it is necessary to temporarily require project proponents to provide land instead of paying fees, unless the Wildlife Agencies agree, after conferring with the Implementing Entity, that a different plan of action developed in concert with the Implementing Entity will remedy the situation and it is not necessary to require project proponents to provide land instead of paying a fee. Alternatively, a Permittee may have accrued sufficient credits to offset any fees due.

If the Wildlife Agencies determine the Plan is at risk of noncompliance with the Stay-Ahead provision, they will so notify the Implementing Entity in writing, and the Implementing Entity and Wildlife Agencies will meet to develop a mutually agreeable plan of action that will fulfill such requirements. If the Wildlife Agencies determine that the requirements of Section 8.6.1 *Stay-Ahead Provision* have not been fulfilled, they may, by written notice to the Implementing Entity, require it to initiate the requirement to dedicate land in-lieu of fees.

Land will be provided to the Implementing Entity according to the guidelines and criteria in Section 8.6.7 *Land Dedication In Lieu of Development Fee*. Project proponents will always have the option of providing land in lieu of the base

development fee as long as the land offered meets the criteria in Section 8.6.7 *Land Dedication In Lieu of Development Fee*. If the Implementing Entity initiated the requirement due its own determination that the Plan was at risk of noncompliance, the requirement to provide land instead of a fee will be lifted (i.e., it will revert back to an option) as soon as the Implementing Entity determines that it is no longer at risk of noncompliance with the Stay-Ahead provision. If the Implementing Entity or Wildlife Agencies initiated the requirement following noncompliance with the Stay-Ahead provision, the requirement will be lifted as soon as the Implementing Entity demonstrates in writing to the satisfaction of the Wildlife Agencies that the Plan is in compliance with the Stay-Ahead provision.

## Conservation Action Deadlines Beyond Stay-Ahead Requirement

As summarized above, the Implementing Entity is required to meet the Stay-Ahead provision so that land acquisition keeps pace with impacts. However, if impacts occur more slowly than expected, strict adherence to the Stay-Ahead provision would result in relatively slow growth of the Reserve System initially, followed by a rapid expansion of the Reserve System in order to meet the final acquisition targets. To ensure that the Implementing Entity makes steady progress towards the final land acquisition targets, in year 20 of implementation, the Implementing Entity will work with the Wildlife Agencies to conduct a formal and complete review of progress toward building the Reserve System. To ensure that the Implementing Entity makes steady progress towards final restoration/creation goals, interim deadlines are established in **Table 5-14** for each watershed in the study area. Section 5.3.6 *Riverine and Riparian Forest and Scrub Conservation and Management* also includes deadlines for riverine acquisition and restoration. The Stay-Ahead provision described above must always be followed.

Chapter 5 also establishes deadlines for conservation actions not related to land acquisition or habitat restoration/creation such as wildlife connectivity studies. See Chapter 5 for these additional deadlines that go beyond the Stay-Ahead requirement for land acquisition.

## Rough Proportionality and Stay-Ahead for the Burrowing Owl Conservation Strategy

The Stay-Ahead requirement for the western burrowing owl conservation strategy is unique because the strategy includes a combination of land acquisition, conservation actions, and management agreements over 5,300 acres<sup>10</sup> of occupied and potential nesting habitat by Year 45. This requirement only applies to occupied and potential nesting habitat (not overwintering only habitat) because these two habitat types are the most critical in meeting the conservation

<sup>10</sup> 600 acres of the 5,300 acres must be permanently protected occupied nesting habitat.

strategy goal of increasing the adult burrowing owl population by three birds per year. The Stay-Ahead requirement for burrowing owl will be applied similar to the Stay-Ahead provision for the Reserve System as a whole, but the calculation will be based on acres of modeled occupied and potential nesting habitat either preserved or managed instead of acres of natural communities preserved. Although temporary management agreements can count toward the burrowing owl Stay-Ahead provision, all management agreements (up to 4,700 acres) must be permanent by Year 45. In addition, managed or permanently protected occupied nesting habitat must remain within 10% deviation of permanent impacts to occupied nesting habitat based on a 3:1 ratio (management or protection to impacts). For example, if 50 acres of permanent impacts to occupied nesting habitat have occurred, then 150 acres of occupied nesting habitat must be under a management agreement or permanently protected.

In addition, to account for the conservation actions that will be applied and to provide an incentive to implement them quickly, the Implementing Entity may credit another 5% of the Stay-Ahead requirement against implementation of conservation actions on managed lands. Together with the allowable 10% deviation, this provides up to a 15% allowance in meeting Stay-Ahead for western burrowing owl. For example, if 66 acres of the 198-acre impact cap for this species has been used (33%), then 1,767 acres (33% of 5,300 acres) must be under management agreement for this species. If necessary, this requirement could be reduced to 1,219 acres (23% of 5,300) to account for 10% allowable deviation. If conservation actions are being successfully applied as determined through consultation with the Wildlife Agencies, the Stay-Ahead requirement for management agreements could be reduced by up to another 5%, to 954 acres (18% of 5,300 acres).

## 8.6.2 Land Acquired by Other Organizations or through Partnerships

It is anticipated that substantial amounts of land for the Reserve System will be acquired by Permittees such as County Parks. SCVWD may also acquire land for the Reserve System. Land that meets the terms of the Plan would be credited towards land acquisition requirements in Chapter 5. In other instances, agencies and organizations who are not Permittees such as the Open Space Authority or local land trusts (e.g., The Nature Conservancy, Peninsula Open Space Trust) will acquire land in the study area that will help meet the goals and objectives of this Habitat Plan. In these cases, it may be appropriate that the Implementing Entity receive credit toward Plan requirements if the acquisitions are made in partnership with the Implementing Entity, they are consistent with Plan goals, and the lands are enrolled into the Reserve System through placement of a conservation easement. It is expected that the Implementing Entity will be involved in many of the land acquisitions in the study area during the permit term. However, the Implementing Entity may own little or no land itself. For example, if the Implementing Entity partners with other groups and provides matching funds, larger land acquisitions will be possible than if the Implementing Entity were to purchase the land on its own. Land acquired through partnerships

with non-Permittees can be counted toward the Habitat Plan conservation requirements (i.e., contribution to recovery) only if the acquisition meets the criteria for Reserve System lands described in Chapter 5 and the criteria described above in Section 8.6 *Land Acquisition*.

Credit will be determined based on the purpose and location of the acquisition, the management of the land acquired, and consistency with the conservation strategy of the Habitat Plan. The Plan budget assumes that the Implementing Entity will always fund management and monitoring on land in the Reserve System; actual funding will be determined on a case-by-case basis. Land acquired through partnerships could be managed and monitored by the Implementing Entity or by other groups or agencies as long as a contract or other binding agreement is in place to ensure that management and monitoring occurs according to the terms of the Plan. Land acquired with state or federal money will be credited toward the state/federal contribution discussed in Section 9.4.3 *State and Federal Funding* (Chapter 9). All acquisitions credited toward the land acquisition requirements of the Plan can be credited toward the Stay-Ahead provision as discussed in Section 8.6.3 *Conservation Easements* above, regardless of who manages the property and regardless of the source of funding for acquisition or management.

## Land Acquisition during Plan Development (Interim Conservation)

Open space agencies and organizations in the study area have been acquiring land during Habitat Plan development. Consistent with the NCCP Act Section 2810(b)(8) and the Planning Agreement, parcels or portions of parcels acquired after approval of the Planning Agreement (October 2005) can be counted toward meeting Plan requirements according to the procedures and criteria described above for lands acquired by other organizations or through partnerships. In addition, lands acquired during Plan development can only be credited against Plan requirements to the extent the land is acquired without mitigation funds. If an acquisition occurs using some mitigation funds, only that portion of the acquisition funded by non-mitigation funds can be credited towards the Plan. The Implementing Entity may expend funds to augment management of these interim purchases if the augmentation is necessary to provide credit toward Plan land acquisition requirements.

Lands acquired during Plan development that may be counted toward Plan requirements must meet the criteria outlined in Section 8.6 *Land Acquisition* above. Likely interim land acquisitions are listed in **Table 5-5** and shown **Figure 5-4**. Other lands conserved during Plan development may not appear in **Table 5-5** or **Figure 5-4** if the conservation action took place during production of the final Habitat Plan or if preparers of the Plan were not aware the property had been conserved. Such lands may be counted toward Plan requirements using the same criteria described in this section.

## Private Mitigation Banks

A mitigation bank is privately or publicly owned land that is managed for its natural resource values. Mitigation banks may sell species credits, wetland credits, or both. The bank sells credits to private or public project proponents to offset their impacts, and the money is used to improve and maintain the resources. Conservation banks must be approved by USFWS and CDFG (and the Corps if the bank is also selling jurisdictional wetland credits). In exchange for permanently protecting the land, the bank operator is allowed by the Wildlife Agencies to sell species credits to developers who need to satisfy legal requirements for compensating for the impacts of projects that affect listed species or their habitat<sup>11</sup>. A conservation or mitigation bank is a free-market enterprise that performs the following functions.

- Offers landowners economic incentives to protect natural resources.
- Saves project proponents' time and money by providing them with the certainty of preapproved compensation lands.
- Provides for long-term protection and management of habitat.
- The goals of private mitigation banks are similar to those of regional HCPs or NCCPs, including this Plan.

Credits sold by private mitigation banks within the permit area can count toward the Habitat Plan if they are consistent with the conservation, monitoring, adaptive management, and other relevant provisions of the Plan. For the bank to be eligible to sell credits to project proponents (public or private) with activities covered by the Habitat Plan, the bank must meet all of the relevant standards of habitat enhancement, adaptive management, and monitoring outlined in Chapters 5 and 7. All impacts and mitigation for impacts covered under the Habitat Plan must occur within the permit area analyzed in USFWS's biological opinion for the Habitat Plan. Similarly, CDFG policy requires all impacts and mitigation to occur within the permit area. As such, mitigation banks located outside of the permit area may not be used.

Mitigation bankers wishing to establish a bank whose credits can count toward Habitat Plan requirements must notify the Wildlife Agencies to allow consideration of such provisions during bank development and agency approval. Bankers must also coordinate closely with the Implementing Entity to help ensure the bank's consistency with the Habitat Plan and use by Habitat Plan Permittees.

There are currently no approved conservation or mitigation banks in the study area. A bank near Gilroy on Lucky-Day Ranch is currently being proposed to USFWS and CDFG. There are several banks in adjacent counties whose service area extends into the study area. Credits sold by banks located outside the permit area cannot count toward Plan goals or Plan fees even if the bank's service area extends into the permit area.

<sup>11</sup> For additional information on banking see: [www.dfg.ca.gov/hcpb/conplan/mitbank/mitbank.shtml](http://www.dfg.ca.gov/hcpb/conplan/mitbank/mitbank.shtml).

### 8.6.3 Conservation Easements

Conservation easements will be used as an important tool in Plan implementation in three ways:

- Conservation easement placed on land or watercourses acquired in fee title by the Implementing Entity or one of its land acquisition partners to secure credit under the Plan (see Section 8.6 *Land Acquisition*).
- Conservation easement purchased from a private party and placed on the land or water still owned by the landowner (i.e., as an alternative to fee title acquisition).
- Conservation easement placed on land or water in public ownership at the time of permit issuance.

This section describes the process for developing acceptable conservation easements in all three cases. These guidelines and rules will be used by the Implementing Entity or by its partners acquiring conservation easements on behalf of the Implementing Entity with Habitat Plan funding.

All conservation easements acquired to meet the goals of the Habitat Plan will be in perpetuity and in accordance with California Civil Code Sections 815 et seq.<sup>12</sup> as well as the current policies of the Wildlife Agencies. All conservation easements will be voluntarily offered by the holder of the underlying fee. The conservation easements will be dedicated to the Implementing Entity or to another conservation organization (e.g., California Rangeland Trust, The Nature Conservancy) if that organization is approved by the Implementing Entity, the Wildlife Agencies, and the landowner. In addition, a binding agreement must exist between the Implementing Entity and the easement holder to ensure compliance with the permits, Implementing Agreement, and Plan. An objective of the easements is to have consistency in enforcement, monitoring, and maintenance. Conservation easements on land owned by the Implementing Entity must be held by another conservation organization.

USFWS and CDFG will be named as third party beneficiaries on all conservation easements. To ensure compliance with the Plan, all conservation easements will follow the template easement in **Appendix H** as close as is reasonably possible. Reasonable variations from the template may be needed to address site-specific constraints. CDFG and USFWS, along with the Implementing Entity, must review and approve any modifications to the template easement.

It is the responsibility of participating landowners to abide by the terms of these conservation easements. The terms and prices of conservation easements will be negotiated on a case-by-case basis between the landowner and the Implementing Entity. The specific terms of the conservation easement will be developed on a case-by-case basis depending on site conditions, landowner preferences and operations, and species and habitat needs. Some landowners may wish to reserve

<sup>12</sup> This section of California law allows placement of restrictions on the use of land for conservation purposes that is binding on all successive owners of that land.

a portion of their property for uses that are incompatible with the Habitat Plan such as a home site or a recreational facility with high intensity use. In these cases, the conservation easement may either exclude the incompatible site or apply to the entire property but define the portion of the site in which the incompatible uses are allowed<sup>13</sup>. The Habitat Plan will only receive credit for the portion of the property that is compatible with Plan goals and objectives.

Each conservation easement for the property or portion of the property that will be incorporated into the Reserve System will be drafted to:

- ensure that the property will be kept in its natural or existing condition (all or portions of the site may also be enhanced or restored),
- protect the existing, enhanced and/or restored conservation values of the property forever,
- ensure that the easement cannot be extinguished without the prior written consent of the Implementing Entity and the identified third party beneficiary Wildlife Agencies,
- confine the allowable uses of the property to those activities that do not interfere with the preservation or enhancement of those conservation values consistent with the Plan, and
- prevent any use of the property that would impair or interfere with the conservation values of the property.

The conservation values will be specifically described in terms of covered species and their habitat, as well as other land cover types and natural communities on the property. Conservation values will be described, at a minimum, using the land cover types and covered species habitat described in Chapter 3 and **Appendix D**. A legal description and map must be included in the easement.

Each conservation easement will prohibit certain activities as described in the Template Conservation Easement (**Appendix H**), except as necessary to meet the biological goals and objectives of the Plan (including infrastructure required to support monitoring, management, and maintenance) or to provide recreational services consistent with the Plan (see Chapter 6, Section 6.4.6, subheading *Condition 9. Prepare and Implement a Recreation Plan*). These allowances will be described in the reserve unit management plan that will be developed by the Implementing Entity. In addition, all recorded conservation easements must include or incorporate by reference the items listed below.

- The initial pre-acquisition assessment of covered species habitat and natural communities present.
- A detailed list of the allowable uses and use restrictions on the parcel, consistent with the minimum requirements stated above.

<sup>13</sup> There may be advantages to having the conservation easement apply to the entire site, for example, to avoid costly boundary surveys needed to define the conservation easement more narrowly than the property boundary.

- Any mandatory terms and conditions to maintain or enhance the habitat pursuant to Section 5.2.5 *Land Management* of this Plan.
- Provisions for access by the Wildlife Agencies and the Implementing Entity or its designee to monitor compliance with the terms of the conservation easement and to carry out all applicable management and monitoring requirements described in Chapter 5 and Chapter 7, respectively.
- The allowances or restrictions on public access and recreation on the site, compatible with the conservation goals of the Plan, *Condition 9 Prepare and Implement a Recreation Plan for each Reserve Subunit* in Chapter 6, Section 6.4.6, and landowner wishes.
- Conservation easements on grazing lands will describe the general nature of the grazing to be allowed. The easement will specify the desired vegetation and other habitat conditions and, if necessary, impose limits on the timing, stocking density, and duration of permitted grazing to meet those conditions. These desired conditions and grazing limitations will be allowed to fluctuate according to the adaptive management process. A baseline condition will be described to provide a benchmark to measure habitat enhancement on the site. The conservation easement may accomplish this requirement by reference to a separate reserve unit management plan prepared for the lands covered by the easement.
- The conservation strategy does not call for acquisition of cultivated agricultural land. However, conservation easements on cultivated agricultural land may accompany acquisitions that primarily service other strategic objectives. If cultivated agricultural land is acquired, the conservation easement will ensure that the land meets one or more biological goals and objectives of the Plan. If the site contains aquatic or riparian habitat that supports or could support covered species, the conservation easement will also generally describe measures to maintain or enhance those habitats. The conservation easement may accomplish this requirement by attaching or referencing a separate reserve unit management plan prepared for the lands covered by the easement. Alternatively, if the reserve unit management plan is prepared later, it may contain additional detail on site enhancement.
- Conservation easements will take into account issues of water use efficiency and runoff into adjacent or nearby streams and their potential effects on covered species, if applicable.
- Provisions for enforcement and available remedies for the Implementing Entity or appropriate other party in the event that title holder or third party violates the terms of the conservation easement.
- If the easement boundaries are different from the parcel boundaries, a legal description and map will accompany the easement.
- When a reserve unit management plan is prepared for private property according to Section 5.2.5 *Land Management*, the Implementing Entity will record a Memorandum of Unrecorded Reserve Management Plan, indicating where that reserve unit management plan may be found and that the terms of such reserve unit management plan will be followed. Such a title record

ensures that the reserve unit management plan will be tied to the conservation easement in the event property ownership changes. The title record also ensures management of the site in perpetuity.

To approve and accept a conservation easement, the Implementing Entity must have the following documentation.

- A pre-acquisition assessment of the property summarizing the baseline biological conditions including the presence and condition of natural communities and the presence and condition of covered species, if known (a complete biological inventory of the site would be conducted after the easement is recorded).
- A preliminary title report and legal description of the property.
- Assurance that any superior liens or interests will not substantially conflict with the property's conservation values.
- Evidence of all other easements, covenants, restrictions, reserved rights, and other property interests (including water rights).
- A clean Phase I environmental analysis for hazardous materials.
- A map and description of the parcel and its physical condition (e.g., roads, buildings, fences, wells, other structures) and its relation to other components of the Reserve System and other properties subject to other permanent protections for conservation purposes.
- A Property Analysis Report (PAR) or comparable assessment of the initial capital costs and ongoing management funds required to manage and monitor the lands (e.g., applicable components of Habitat Plan cost estimate).

## Easements on Land Acquired by or for the Implementing Entity

As described in Section 8.6 *Land Acquisition*, the Implementing Entity must secure permanent protection of a property in order to receive credit under the Plan. If the land is owned by the Implementing Entity or a Permittee, a conservation easement must be placed on the site to ensure permanent protection. For lands acquired for the Reserve System but owned by other public entities, permanent protection must also be ensured by a conservation easement consistent with the requirements of Section 8.6.3 *Conservation Easements*. In either case, conservation easement terms will be consistent with those described in this section.

## Easements on Private Land

This Plan assumes that the Implementing Entity and its partners will purchase some of the land for the Reserve System in conservation easements rather than in fee title. For example, conservation easements are appropriate where landowners

wish to remain on the property and the Plan's conservation goals can still be met with an easement. Conservation easements have been used throughout California to preserve farms, ranches, and the working landscapes that they support. The conservation easements purchased by the Habitat Plan Implementing Entity are intended to preserve the natural features of a property. However, as a secondary benefit, these easements are also expected to protect working landscapes of all kinds throughout the study area. Only portions of properties that meet one or more of the goals of the Plan will be credited to the Plan as part of the conservation strategy. In some cases, an easement may be placed over more of a property than initially credited with the hope that other portions of the property may be restored or enhanced to accommodate Plan goals in the future. Additional credit may be applied to these other sites once they meet Plan goals.

Some ranchers may prefer selling a conservation easement to selling their land in fee title so they can remain on their land and continue to conduct livestock operations. Livestock grazing will be an important management tool in the Reserve System (see Chapter 5), so this use is likely to be compatible with the conservation goals of Plan and therefore suitable for conservation easements.

## Easements on Existing Public Lands

As described in Chapter 5, one component of the conservation strategy is to enhance the management and monitoring of high-value sites on existing public lands within County Parks and the Open Space Authority (**Table 5-5**). The Habitat Plan will provide additional funds or staff to these agencies to perform specific management and monitoring tasks in selected park units that will substantially benefit the covered species and natural communities. To ensure that these sites will be managed in perpetuity to benefit the covered species, the Plan proposes permanent conservation easements that allow recreational uses compatible with the conservation strategy of the Plan on approximately 12,000 acres of the County park lands identified and described in **Table 5-5** and illustrated in **Figure 5-4**. These sites will be enhanced to support the Habitat Plan and will be incorporated into the Reserve System.

Credit will be applied to the Habitat Plan once sites on existing public lands are placed under a conservation easement or other permanent dedication that is consistent with the easement requirements described in this section.

### 8.6.4 Grazing Leases, Licenses or Contracts within the Reserve System

Livestock grazing is an important management tool that benefits some terrestrial covered species. As a result, managed livestock grazing is expected to be used extensively in the Habitat Plan Reserve System. Existing grazing leases or

licenses<sup>14</sup> on a newly established reserve acquired in fee title will continue until a reserve unit management plan is prepared and approved by the Implementing Entity and the Wildlife Agencies. After the reserve unit management plan is approved, all grazing leases or licenses on the reserve will be reviewed by the Implementing Entity for consistency with the reserve unit management plan and with the terms of the Habitat Plan. If necessary, leases or licenses will be revised and brought into compliance with the Plan's conservation strategy and the framework for adaptive management to the extent allowable by the terms of the lease. Areas covered by incompatible leases will be excluded from the Reserve System until the incompatibilities are resolved. If land is acquired in fee title from a landowner who is also the grazing operator, the Implementing Entity will maintain the previous grazing regime with a willing former landowner (e.g., through a short-term lease) until a reserve unit management plan is prepared and approved by the Implementing Entity and the Wildlife Agencies. Once approved, this reserve unit management plan will establish the grazing regime on the site, which can then be incorporated into long-term grazing leases.

If livestock grazing is introduced to a reserve acquired in fee title or if the preexisting grazing lease or license expires, the Implementing Entity or other Permittee agency (e.g., County Parks) will enter into a lease agreement or license with the livestock operator. A contract may be necessary in the event that the livestock operator is paid by the Implementing Entity to graze livestock (e.g., when grazing a small site or using a prescription that does not provide an economic return to the operator). The contract, lease agreement, or license will specify the desired vegetation and other habitat conditions and impose limits on the timing, stocking density, and duration of permitted grazing to meet those conditions. Grazing contracts, leases, or licenses will be reviewed annually with the operator to adjust grazing practices to best meet habitat goals. At the expiration of the contract, lease, or license, the Implementing Entity will review monitoring data to determine whether the contract, lease, or license should be reissued with no changes in grazing management, reissued with changes in the grazing regime, or not reissued. All new and renewed contracts, leases, or licenses will include the following conditions of agricultural use and covenants to protect resources.

- Grazing capacity and stocking rates.
- Evaluation of fencing of riparian areas.
- Residual dry matter guidelines.
- Conditions under which the desired stocking rate can be changed or exceeded (e.g., seasonal adjustments to maintain habitat quality, annual adjustments in response to rainfall).
- Grazing and livestock practices.
- Pest control restrictions.
- Reporting requirements.

---

<sup>14</sup> A lease is a short- or long-term contract for use of a property, whereas a license is a short-term permit allowing use under an established program. Both leases and licenses may be applicable to livestock grazing in the study area.

The lease agreement will also outline the responsibilities of each party for maintaining reserve infrastructure (e.g., fences, watering facilities). In addition to maintenance of reserve infrastructure, lease agreements will also include the responsibilities of the grazing lessee to maintain or meet desired habitat conditions. Responsibilities of the grazing lessee may include, but are not limited to:

- Fence repair and maintenance;
- Weed control, including any necessary herbicide application;
- Feral pig management; and
- Pond maintenance.

Other maintenance actions may be included in the lease agreements if deemed appropriate by the Implementing Entity. Costs to perform these actions are included in the cost model assumptions (see Chapter 9, and **Appendix G**).

## 8.6.5 Willing Sellers

A key principle of the Habitat Plan is that land will only be acquired by the Implementing Entity for the conservation strategy from willing sellers. This principle will be strictly followed; the Implementing Entity will not condemn land from unwilling sellers in order to meet Plan conservation requirements. Likewise, the Implementing Entity will not partner or contract with a separate agency to condemn land from unwilling sellers for the Habitat Plan, nor will it contribute funding toward a condemnation from an unwilling seller.

Nothing in the Habitat Plan will prevent other organizations from exercising their powers of eminent domain for purposes other than implementation of the Habitat Plan and with funds other than those raised as a result of this Habitat Plan. If subsequent to such a condemnation, and after soliciting input from the Public Advisory Committee, the Implementation Board of the Implementing Entity finds that the condemned lands are integral to the successful implementation of the Habitat Plan, the Implementing Entity may seek agreement with the owner of the condemned lands to manage those lands in a manner consistent with the Habitat Plan.

Given the many land acquisition requirements in Chapter 5 (see Section 5.3.1 *Land Acquisition and Restoration Actions*), it is possible that one or several landowners who own key resources of interest to the Implementing Entity will refuse to sell, or that negotiations to sell will fail. It is impossible to predict at this time where this may occur and in what context it will occur (e.g., how much of the Reserve System has been acquired, the extent of resources remaining to protect). This situation, if it occurs, is only expected near the end of Year 45, when all land acquisition requirements must be met. By this time, most or all of the development impacts will likely have occurred; consequently, any delays in land acquisition associated with a lack of willing sellers will affect few covered activities. This situation can be avoided if the Implementing Entity begins negotiations with key landowners early in the permit term. A review of progress

toward land acquisition goals will take place at least annually with each annual report submitted to the Wildlife Agencies.

If key landowners are not willing to sell, the Implementing Entity, in coordination with the Wildlife Agencies, will reconfigure the land acquisition strategy to ensure that the biological goals and objectives will be achieved and that the total extent and type of lands to be preserved under the Habitat Plan will be acquired. If such a reconfiguration is not possible, the options below will be considered.

- Requiring project proponents to provide land instead of fees to obtain coverage under the Plan (see Section 8.6.7 *Land Dedication In Lieu of Development Fee*).
- Slowing or stopping local permit issuance under the Habitat Plan until key land acquisitions can be made.

## 8.6.6 Gifts of Land

The Implementing Entity may accept land (or other conservation actions) as a gift or charitable donation. The Implementing Entity will evaluate the conservation benefit of the lands donated relative to the goals, objectives, and requirements of the Habitat Plan. Donated land that does not meet these goals, objectives, and requirements may be sold or exchanged to enable acquisition of land that does meet these goals, objectives, and requirements.

## 8.6.7 Land Dedication In Lieu of Development Fee

Private landowners or Permittees (i.e., project proponents) may own land that can help to meet the conservation goals of the Plan. Project proponents that own land within a priority conservation area (**Figure 5-8**) may wish to transfer fee title or place a conservation easement on the portion of their property within the Plan's conservation areas. If approved by the Implementing Entity and Wildlife Agencies, this transfer or easement dedication can reduce or eliminate the land cover, serpentine, burrowing owl, and/or temporary impact fees required for development of the remaining portion of the property. Some project proponents who wish to develop parcels may own other parcels within an area targeted for conservation by the Plan. Transferring title or dedicating a conservation easement on the site within the target conservation area could eliminate or substantially reduce some of the development fees to develop the other property. Alternatively, project proponents may prefer to acquire their own mitigation lands within target conservation areas and transfer title of these lands or dedicate easements on them to the Implementing Entity instead of paying all or a portion of the development fees. This section describes the process for allowing these situations.

Land cannot be provided in lieu of any required wetland fees. However, project proponents may implement their own wetland restoration or creation project in

lieu of all or a part of wetland fees. See Chapter 9, Section 9.4.1, subheading *Aquatic Restoration or Creation Provided in Lieu of Wetland Fee* for details.

## Criteria for Providing Land In Lieu of Development Fees

Land will be eligible for land cover, serpentine, burrowing owl, and/or temporary impact fee credit if the land satisfies the criteria below.

- The land satisfies the criteria for Reserve System lands in Chapter 5 and as summarized in Section 8.6 above.
- The land is within an area designated as high or moderate priority for acquisition (see Chapter 5, Section 5.3.1 *Land Acquisition and Restoration Actions* and **Figure 5-8**), or the unique and high values on the site justify its inclusion in these designated areas.
- The transaction is approved for the Reserve System by the Implementing Entity and the Wildlife Agencies, consistent with their review and approval authority over all land acquisitions for the Reserve System (see Section 8.6 *Land Acquisition*, Step 9).

Project proponents are encouraged to provide to the Implementing Entity baseline data on their offered properties that document their biological value to the Plan. Documentation should explain how the site meets land acquisition requirements and biological goals and objectives. However, the property owner must provide access to the proposed site to allow Implementing Entity staff or their designees to survey the site and verify its biological value for the Reserve System. If needed, surveys would be performed at no cost to the project proponent. The Implementing Entity should also consult local land managers when evaluating land in lieu proposals to help determine long-term management and monitoring issues, feasibility, and costs. The project proponent will pay the cost of other due diligence such as Phase 1 site assessment, appraisal, and title search.

The Implementing Entity will consider requests for a development fee reduction or waiver in exchange for land dedication (title transfer or conservation easement) on a case-by-case basis. The amount of the development fee reduction will be assessed according to the criteria provided in Chapter 9, Section 9.4.1, subheading *Criteria for Determining Fee Credit for Land Provided in Lieu of Development Fees*.

## Stream Setbacks

As described in Chapter 6, Section 6.5, subheading *Condition 11 Stream and Riparian Setbacks*, covered projects that occur adjacent to streams and riparian areas are required to establish setbacks from these resources. Landowners will not pay fees on the portion of their parcels that are dedicated as stream setbacks

(see Chapter 9 for details on required fees or fees waivers). In some cases, stream setback dedications may be suitable for inclusion in the Reserve System and therefore may be able to offset all or a portion of the development fee outside of the setback. To qualify for inclusion in the Reserve System, stream setbacks must be placed in a conservation easement according to the requirements in Section 8.6.3 *Conservation Easements* above. In addition, lands must meet the criteria described above for land in lieu of development fees.

## 8.6.8 Williamson Act Parcels

The California Land Conservation Act of 1965, or Williamson Act, established the state's primary program for the retention of private land in agriculture and open space use. The Williamson Act is a voluntary program that offers reduced property taxes on lands that have enforceable restrictions on their use via contracts between individual landowners and local governments. Each of the participating jurisdictions administers the Williamson Act program in their jurisdiction. According to data from Santa Clara County, 219,757 acres within the study area are currently under Williamson Act contracts. Williamson Act lands in unincorporated portions of the study area are found in the Santa Cruz Mountains, Diablo Range, and in the Santa Clara Valley floor in and near Morgan Hill and Gilroy.

A majority of the land anticipated to be part of the Reserve System is currently subject to Williamson Act contracts. The preservation of open space is consistent with Williamson Act contracts. However, the intention of these contracts is to preserve agriculture (livestock grazing or cultivated crops) on private lands. If the Implementing Entity acquires lands subject to Williamson Act contracts, the Implementing Entity is expected to allow these contracts to lapse at the end of their 10-year term (i.e., file for non-renewal). Alternatively, the Implementing Entity could apply to the County to convert the contracts to Open Space Easement Agreements pursuant to California Government Code 51255 through an existing County program. Such conversions would be subject to approval by the County Board of Supervisors.

## 8.7 Roles and Responsibilities in Reviewing Applications for Take Authorization

### 8.7.1 Permittee Responsibilities

Upon approval of the Plan by the Wildlife Agencies, the Permittees will be issued permits for take of covered species. For projects conducted by a Permittee, the Permittee will be responsible for assuring that the project conforms to the requirements of the Plan, following the process for utilizing take authorization described in Chapter 6, Section 6.7.1 *Evaluation Process for Permittee Projects*.

The Permittees will also be capable of extending Plan coverage to private landowners and other private project proponents within the permit area who are under their jurisdiction, provided that their projects or activities are covered by the Plan and are executed in accordance with the terms and conditions of the Habitat Plan, the permits, and the Implementing Agreement. Landowners and other project proponents who receive this coverage are referred to as *Third Party Participants*.

To receive take authorization under the state and federal permits, private project proponents must apply to their local jurisdiction (i.e., the appropriate city or the County, the local land use planning agency with land use authority for the project) for take authorization following the process described in Chapter 6, Section 6.7.2 *Application Process for Private Projects*.

The participating cities and the County will be the agencies with primary authority and responsibility for reviewing private development applications and authorizing take. Unless another entity is specifically identified in the Plan as responsible for a particular aspect of reviewing private development applications and authorizing take, the responsibility and authority will rest with the cities and the County. Each Permittee will hold all responsibility and authority for their own projects but will have to report their amount of take to the Implementing Entity for tracking purposes.

For project proponents within the permit area that are not subject to the land use authority of a Permittee (i.e., special districts), the project proponent must apply to the Implementing Entity as a Participating Special Entity (see Section 8.4 *Participating Special Entities*).

## 8.7.2 Implementing Entity Responsibilities

The Implementing Entity will have limited responsibility and authority in reviewing and approving take authorization. Its primary role will be to track the amount and type of take authorization, and to support the Permittee's decision-making process rather than to serve as a final authority to the Permittees. Accordingly, the Implementing Entity will provide tools for Permittees to use in their application review and project assessment process (e.g., checklists, template planning survey report, fee calculator). The Implementing Entity must track impacts of all covered activities in a way that detects when any impact cap is being approached. The Implementing Entity will notify the Permittees when any impact cap is imminent and what procedures should be followed to ensure that the cap is not exceeded. In addition, the Implementing Entity will provide advice, upon request, to the cities and the County as they process applications for take permits and will promote coordination among Permittees to ensure that the Plan is implemented consistently and effectively.

The Implementing Entity has specific authority related to reviewing and approving take authorization, as listed below.

- Reviewing applications from Participating Special Entities (Section 8.4 *Participating Special Entities*) and authorizing take as appropriate.
- Approving offers of land in lieu of fees (Section 8.6.7 *Land Dedication In Lieu of Development Fee*) and of restoration or creation of wetlands in lieu of wetland mitigation fees (see Chapter 9, Section 9.4.1 *Habitat Plan Fees* subheading *Wetland Mitigation Fee*). Local jurisdictions must forward such applications to the Implementing Entity for review, approval, and calculation on a case-by-case basis of the required fees, if any. Once the proposal is approved, the terms of the land offer, habitat restoration/creation, and any remaining fees will be forwarded to the local jurisdiction for their incorporation into the project conditions of approval.
- Reviewing and approving stream-setback exceptions requested by a local jurisdiction, and reviewing and commenting on, if necessary, stream-setback exceptions requested by a private applicant (see Chapter 6, Section 6.5, subheading *Condition 11 Stream and Riparian Setbacks*).
- Recalculating the fees annually according to the indices described in Chapter 9, Section 9.4.1 *Habitat Plan Fees* subheading *Adjustment of Mitigation Fees* or periodically according to the assessment process described in the same section, and providing the new fees to the Permittees. The Implementing Entity will notify each Permittee of the new fees.
- Approving the design requirements for rural road projects as they relate to the covered species and are consistent with the conditions described in Chapter 6, Section 6.4.4, subheading *Condition 6 Design and Construction Requirements for Covered Transportation Projects*.

### 8.7.3 Wildlife Agency Responsibilities

The Wildlife Agencies will not be involved in approving take authorization for Permittees or for private development projects within the jurisdiction of the Permittees on a project-by-project basis, except in limited circumstances (e.g., where Section 7 consultations are still required [see the Section 7 process in Chapter 1 and Section 7 Assurances in Chapter 10]) or as required by this Plan (see following section). The Wildlife Agencies will also have approval authority over inclusion of Participating Special Entities (Section 8.4 *Participating Special Entities*). The Wildlife Agencies may monitor the Permittees as they grant take to individual projects. The Permittees are not required to transmit copies of application materials to the Wildlife Agencies each time an application is approved. Permittees are required, however, to provide such information to the Wildlife Agencies upon request. The Wildlife Agencies may offer comments to Permittees, but the granting of take authorization to individual covered activities will remain the purview of the Permittees. The purpose of Wildlife Agency monitoring issuance of take authorization to covered activities is to facilitate communication so that errors or differences of opinion can be addressed before they become serious problems.

The Wildlife Agencies' main responsibility however, will be ensuring that the Permittees are in compliance with the state and federal permits, Implementing Agreement, and Plan. Reviewing and commenting on annual reports and monitoring reports (see Section 8.10 *Data Tracking*) will be a key means for the Wildlife Agencies to monitor compliance. The Wildlife Agencies will also review and approve all:

- Reserve unit management plans,
- Site restoration plans,
- Plant and pond creation proposals<sup>15</sup>,
- Covered species translocation activities,
- Tier 3 burrowing owl conservation actions,
- Burrowing owl management agreements,
- Burrowing owl passive relocation,
- Conservation easements, and
- Land acquisition proposals.

## Additional Review

A small subset of the covered activities will require additional review and approval by the Wildlife Agencies to ensure that the covered activity is adequately defined, consistent with the Habitat Plan, and incorporates appropriate conditions in Chapter 6. Early consultation with the Wildlife Agencies is strongly encouraged to ensure that relevant conditions of the Plan are incorporated into project designs and proper surveys are conducted in advance of project construction. These projects and the allowable scope of Wildlife Agency review are described below (see Chapter 2 for details on these activities).

- Highway, roadway, interchange upgrades, and mass transit projects occurring outside the planning limit of urban growth or in any in-stream area. The scope of the early design coordination will be limited to ensuring the relevant conditions of the Plan are incorporated into project design.
- Flood protection projects proposed by SCVWD that are covered by this Plan. The scope of this review will be limited to early conceptual design and to ensuring that impacts described in Chapter 4 are not exceeded and that the conditions in Chapter 6 are being applied properly to minimize effects on covered species.
- Levee reconstruction projects that go beyond the current footprint of the levee and results in permanent impacts to the stream.

---

<sup>15</sup> If the Implementing Entity establishes a Habitat Plan RGP or other approved permitting process with the Regional Boards, the Corps and Regional Boards would also have review authority over restoration and creation projects that are intended to meet the mitigation requirements of those agencies.

- Supplemental water pipeline alignment associated with dam seismic retrofit projects that occurs in natural land cover types.
- Borrow sites for dam seismic retrofit projects will also be subject to additional Wildlife Agency review due to the uncertain location and size of these projects. The scope of the Wildlife Agency review of proposed borrow sites will be limited to location, size, and impacts of the borrow sites to covered species and their habitat.
- Alamos Creek/Almaden Reservoir fish passage. The scope of the Wildlife Agency review will be limited to the effects of the selected fish passage alternative on the covered species.
- Dewatering events at reservoirs where flows will be released to local channels. This includes review and approval of a reservoir-specific dewatering plan, which will be developed prior to the first dewatering event at each covered reservoir.
- Reoperation of the Ford Road or Church Avenue groundwater recharge ponds, if SCVWD identifies a potential change in downstream flows at either facility that may affect covered species beyond that identified in Chapter 4 (no changes in downstream flows are expected at either site).
- Activities that are major new point sources of nitrogen deposition that could adversely affect serpentine natural communities and associated covered species (e.g., new power plant, large diesel generators, or other facilities). The Wildlife Agencies will determine if the effects analyzed in the Habitat Plan adequately address the effects of new major sources of nitrogen. If the effects were not adequately analyzed, a major amendment, as described in Chapter 10, may be appropriate.

## 8.8 Three Creeks HCP

As described in Chapters 2 and 5, the SCVWD is preparing a separate HCP for its water supply operations in the three watersheds that drain to the San Francisco Bay—the Coyote Creek, Guadalupe River and Stevens Creek watersheds (proposed Three Creeks HCP). The proposed Three Creeks HCP includes implementation of the Fisheries and Aquatic Habitat Collaborative Effort (FAHCE). Many of the covered activities and conservation actions proposed in the Three Creeks HCP in the Coyote Creek and Guadalupe River watersheds are also included in this Plan. Both plans are consistent with each other for these overlapping covered activities and conservation actions.

The permits for the two plans will not overlap. SCVWD will request a permit from NMFS for the proposed Three Creeks HCP but not the Habitat Plan. SCVWD will request incidental take authorization for impacts not addressed in this Habitat Plan from USFWS for covered species affected by Three Creeks HCP covered activities through either Section 7 or Section 10 of the ESA, as appropriate. For example, the Habitat Plan does not cover the upper Guadalupe River Watershed above Vasona Lake (e.g., Lexington Reservoir is not covered by the Habitat Plan) but this area is covered by the Three Creeks HCP.

Similarly, the Habitat Plan excludes a small portion of the lower Coyote Creek Watershed in the City of Milpitas that is covered by the Three Creeks HCP (see **Figure 1-3**).

We expect consistent and cooperative implementation of the two plans because, where there is geographic and functional overlap of the two conservation plans, (a) the two plans provide for conservation goals, objectives, and actions that are consistent with each other, and (b) any proposed Three Creeks HCP conservation measures implemented prior to approval of the Habitat Plan will be consistent with the measures provided for in the Habitat Plan. For example, the Habitat Plan identifies areas where suitable habitat exists and may be acquired, protected, and managed to contribute to the recovery of listed species. SCVWD will provide mitigation for terrestrial species and habitats consistent with what has been proposed by the Habitat Plan—e.g., within the areas identified to be acquired and using the same criteria to guide acquisition, protection, management, and monitoring by the Habitat Plan.

## 8.8.1 Implementation Structure

As the sole permittee for the proposed Three Creeks HCP, the SCVWD is solely responsible for administering and implementing that plan and for compliance with the terms and conditions of its Implementation Agreement and permits, as well as all other applicable laws. USFWS, NMFS, CDFG, the draft settlement agreement parties, and the public will also participate in some way in the Three Creeks HCP implementation. The successful execution of the Three Creeks HCP conservation strategy, monitoring and adaptive management program, and reporting that are part of the Three Creeks HCP require coordinated actions between and among the SCVWD, the Wildlife Agencies, and in some cases, other parties.

## 8.8.2 Adaptive Management

SCVWD will be responsible for, and oversee, the monitoring and adaptive management program for the proposed Three Creeks HCP, which has been designed to be consistent with the monitoring and adaptive management program of this Plan (Chapter 7). The SCVWD will perform day-to-day activities, including prioritizing management actions, disseminating information, developing annual and long-term work plans, and formulating adaptive management strategies. SCVWD may implement additional and/or modified biological monitoring, studies, or management measures consistent with the Three Creeks HCP.

The Wildlife Agencies, among others, will provide input and help guide the proposed Three Creeks HCP's adaptive management program, but the SCVWD has ultimate responsibility for implementing the program and instituting changes through adaptive management.

## 8.9 Implementing Agreement

The NCCP Act requires an Implementing Agreement for all NCCPs, and specifies necessary provisions. Although not a requirement under ESA, Implementing Agreements are recommended by USFWS for large-scale HCPs that address significant portions of a species range, for HCPs with long-term mitigation and monitoring programs, or for HCPs that include complicated conservation programs.

The purpose of an Implementing Agreement is to ensure that each party understands its obligations under the HCP Section 10(a)(1)(B) permits and NCCP permit, and to provide remedies should any party fail to fulfill its obligations. Accordingly, an Implementing Agreement has been prepared for this Plan (**Appendix B**). This agreement specifies the responsibilities of each party; how minimization, mitigation, and conservation measures will be implemented; reporting and enforcement procedures; and various other provisions agreed to by the parties. The Implementing Agreement references material in the Habitat Plan whenever possible. As a result, the Habitat Plan and the Implementing Agreement have been made as consistent as possible. In the unlikely event that there are inconsistencies among documents, the permits prevail first, then the Implementing Agreement, and finally the Habitat Plan.

## 8.10 Data Tracking

### 8.10.1 Database Development and Maintenance

The Implementing Entity will develop and maintain a comprehensive data repository (i.e., database) to track permit compliance and all other aspects of the Habitat Plan including land and stream management and monitoring. The data repository to track permit compliance will be operating within 12 months after all local ordinances take effect. The data repository will be structured to be “user friendly,” such that a trained staffer (as opposed to a technician or programmer) can enter data. Additionally, the data repository will allow for future expansion and integration with an external database (e.g., linkage to agency or other GIS map libraries). The data repository will be structured to facilitate the following requirements.

- Data documentation such that future users can determine why, how, and where data were collected (documentation standards [i.e., data about the data] should be consistent for all types of monitoring and over time; adequate documentation will facilitate the future use of monitoring data).
- Quality assurance and quality control of the data.
- Access and use of the most current information in assessment and decision making (the database will allow repeated access to current and past information over time).
- Storage of spatial information in a GIS-linked or similar database.

- Data queries and reports.

The primary types of information for which the data repository will be developed and maintained are listed below.

- Status of covered activities, including implementation and impacts on covered species and natural communities.
- Status of Habitat Plan natural community preservation/enhancement/creation/restoration conservation measures.
- Habitat Plan funding and expenditures.
- Monitoring and directed study results.
- Adopted changes to the Habitat Plan, including administrative changes, minor amendments, or major amendments (all defined in Chapter 10).
- All reports and documents generated by the Implementing Entity or the Permittees related to the Habitat Plan.

When the database is first operational after the first year of implementation, it will support as many of the components listed above as will be needed to report on Plan compliance. For example, funding and expenditures will begin in the first year but the results of directed studies will not be available for several more years.

The Implementing Entity may choose to develop a web-linked database to facilitate members of the public and Permittee staff obtaining site-specific information and controlled transfer of information by others into and out of the database. Examples of benefits that could be associated with maintaining controlled web-linked access to selected elements of the comprehensive Habitat Plan database are provided below.

- Development of database entry forms or use of handheld devices that could allow direct input of information into the database by those charged with implementing covered activities, conservation measures, monitoring surveys, and directed studies.
- Access by agencies implementing the Habitat Plan to digital monitoring, research, and other data for purposes of generating internal reports that may be needed to facilitate their participation in the Habitat Plan.
- Access by agencies implementing the Habitat Plan, other ecosystem restoration programs, outside researchers, and other interested parties to Habitat Plan reports and documents.

The Implementing Entity will comply with the data sharing requirements of the Implementing Agreement. If the Implementing Entity allows additional access to the project databases, such access will require strict controls and monitoring to ensure that the integrity of the database is maintained (e.g., use of passwords to limit access of a particular entity to selected database functions, sampling data entry forms to ensure that entered information is complete, compatible, and accurate).

## 8.10.2 Compliance Tracking

The Implementing Entity will track all aspects of compliance with the permits, Implementing Agreement, and Habitat Plan. To track compliance, the Implementing Entity will maintain data as specified below.

- The amount of land cover (**Tables 4-2 and 4-3**), modeled habitat for covered species (**Table 4-4**), and critical habitat (**Table 4-9**) temporarily and permanently impacted by covered activities will be tracked by the Implementing Entity regularly, but no less than annually by overlaying impacts that year (and cumulatively) with each species model in a GIS exercise to ensure that impact caps are not exceeded. Modeled habitat impacts (**Table 4-4**) and modeled habitat acquisition requirements (**Table 5-17**) will be tracked according to the most recently developed land cover maps and habitat models. Implementation of species surveys described in Chapter 6 and the remaining Conservation Strategy (Chapter 5) will be directed by the most current land cover maps and habitat models updated and maintained by the Implementing Entity throughout the permit term.
- The location, extent, and timing of land acquisition and Habitat Plan reserve establishment within each Conservation Analysis Zone according to the requirements in Chapter 5 and in **Tables 5-11, 5-13, 5-16, 5-17, and 5-18**.
- Tracking implementation of management agreements for western burrowing owl nesting habitat (number of acres under management).
- The status of implementation of each conservation action listed in **Tables 5-2a and 5-2b**.
- The success of the conservations actions in meeting the biological objectives in Chapter 5 and in **Tables 5-1a through 5-1d**.
- Descriptions of recorded conservation easements, management agreements for western burrowing owl nesting habitat, lands acquired in fee title, interagency memorandums of agreement, or any other agreements entered into for the purposes of protecting, enhancing, restoring, or creating covered species habitat.
- The location, extent, and timing of impacts on land cover types (including direct and indirect impacts to wetlands) and plant occurrences, by year and cumulative total<sup>16</sup>, based on reports submitted by project proponents and Permittees for take authority under the Habitat Plan.
- The location and extent of annual and cumulative compliance with the species occupancy requirements.
- The location, extent, and timing of restoration or creation of applicable land cover types (**Table 5-12**).
- The location, extent, timing, and progress of plant occurrence creation and enhancement (**Table 5-16**).

<sup>16</sup> Although the tables in Chapter 4 describe impact limits by Permittee, this was done for estimation purposes only. During Plan implementation, take and compliance tracking will be measured against total impact limits for the Permittees collectively.

- The location, extent, timing, and success rates of implementation of all other conservation actions described in Chapter 5 (e.g., preparation of reserve unit management plans, including recreation plans, construction of artificial perches, conducting monitoring).

The Wildlife Agencies may also request other information from the Implementing Entity to verify compliance with the Plan and the Wildlife Agencies' decision documents (e.g., CEQA and NEPA mitigation measures, impacts to critical habitat units). The purpose of monitoring this information will be to track the Implementing Entity's progress toward successful implementation of the conservation strategy described in Chapter 5 of this Plan. This tracking of progress will help ensure that habitats for covered species and natural communities are conserved within the Reserve System at a rate commensurate with the timing and magnitude of impacts from covered activities. The data repository for permit compliance tracking will be operating within 12 months after all local ordinances take effect.

The data will also be linked to supporting information documenting Habitat Plan compliance. These reports and other data will be stored and archived electronically whenever possible. Appropriate supporting information includes the following categories.

- Application material submitted for covered activities.
- Preconstruction survey reports.
- Reports and other documentation related to the screening, selection, and acquisition of reserve lands.
- Designs for covered activities that demonstrate compliance with relevant conditions in Chapter 6 (e.g., urban-wildland interface design elements).

HabiTrak is a standardized database developed by CDFG and others to track NCCP implementation. The database developed for the Plan must be compatible with the HabiTrak system or its successor so that compliance tracking for this Plan can be compared with other NCCPs in California.

Compliance tracking will be supported by the monitoring and adaptive management program described in Chapter 7. In addition to compliance tracking, the monitoring program includes effectiveness monitoring, status and trends monitoring, and directed studies aimed at addressing key management or ecological questions. The data tracking system will be developed to assemble, store, and analyze all monitoring data in the program. The details of the monitoring program will not be developed until individual reserve unit management plans are prepared for each reserve (**Table 8-1**). By necessity, therefore, the data tracking system for the monitoring and adaptive management program cannot be finalized until after this Plan is completed.

## 8.11 Reporting

The Implementing Entity will prepare annual reports over the term of the Habitat Plan that document permit compliance (see Section 8.10.2 *Compliance Tracking*), impacts, conservation actions, management actions, restoration/creation actions, and monitoring results. The annual reports will summarize the previous fiscal year's implementation activities (July 1 to June 30) and be completed by March 15 following the reporting fiscal year. No annual report will be required for the first partial fiscal year. Annual reports will require synthesis of data and reporting on important trends such as land acquisition, fee collection, and habitat restoration. A due date of March 15 will allow time for the data from the previous fiscal year to be assembled, analyzed, and presented in a clear and concise format.

Annual reports will be submitted to the Implementation Board for review and approval. Annual reports will also be submitted to designated representatives of the Wildlife Agencies, and other interested parties such as the Corps and Regional Boards, and will be available to the public and posted on the Habitat Plan website. The Implementing Entity will also distribute these reports to the Independent Conservation Assessment Team and science advisors, as appropriate, for their review. These advisory bodies will use results presented in the annual reports, as well as other available information and any additional monitoring reports produced through the Adaptive Management Program, to assess success of the Habitat Plan in meeting the biological goals and objectives and to formulate recommendations to the Implementing Entity for Plan implementation in subsequent years.

The goals of the annual report are listed below.

- Providing the information and data necessary for the Permittees to demonstrate to the Wildlife Agencies and the public that the Plan is being implemented properly and as anticipated.
- Disclosing any problems with Plan implementation so they can be corrected.
- Documenting issues with Plan implementation that may require consultation with the Wildlife Agencies.
- Identifying administrative or minor changes to Plan components required to increase the success of conservation measures.

At a minimum, annual reports will include the following information.

- A description of all covered activities implemented during the reporting period categorized by major activity type (per Chapter 2) and acreage.
- A year-to-date and cumulative summary (i.e., from the start of the permit term) of permanent and temporary impacts on all land cover types. Impacts on riparian and wetland land cover types will also be reported by watersheds.

- A year-to-date and cumulative summary of impacts to modeled habitat of covered species<sup>17</sup> and to covered plant occurrences.
- A year-to-date and cumulative summary of the total impacts to critical habitat of the California red-legged frog, California tiger salamander, and Bay checkerspot butterfly.
- A year-to-date and cumulative summary of impacts associated with projects exempt from fees and/or conditions of this Plan.
- An accounting of all conditions on covered activities applied to these activities (see Chapter 6).
- A list of all riparian setback exceptions granted each calendar year (Chapter 6).
- A description of all natural community protection/enhancement/creation/restoration conservation actions implemented during the reporting period. Riparian and wetland restoration and creation will also be reported by the watersheds shown in **Figure 3-6** to facilitate regional coordination of wetland mitigation for the Corps and the Regional Boards.
- A year-to-date and cumulative summary of stream and riparian restoration conducted outside of the Reserve System.
- A year-to-date and cumulative summary of the extent of land cover types protected, enhanced, restored, or created. The success rate for restoration and creation projects will also be documented. If conservation easements were used, the report will describe who holds the easements. A map containing this information will also be provided.
- A year-to-date and cumulative summary of the extent of modeled habitat for covered species protected. This will be calculated by overlaying the most current species habitat models.
- A copy of all easements recorded during the reporting year.
- A year-to-date and cumulative summary of the protection of occupied habitat for select covered wildlife species described in Chapter 5.
- A year-to-date and cumulative summary of the protection or creation of covered plant occurrences and occupied habitat for selected covered wildlife species as defined in Chapter 5.
- A year-to-date and cumulative summary of permanent and temporary management agreements for the burrowing owl to demonstrate that the amount of managed lands for the burrowing owl at no time decreases during the permit term, as described in Chapter 5.
- A year-to-date and cumulative summary of exceptions to the burrowing owl passive relocation prohibition, as described in Chapter 6.
- An assessment of the progress toward all acquisition requirements by local, state, and federal sources, including land cover types, landscape linkages,

<sup>17</sup> Species habitat models will be updated during the permit term based on best available science. This data will be used for tracking compliance for impacts and conservation.

covered plant occurrences, and wetland protection. This assessment will include evaluation of compliance with the reserve design and assembly principles in Chapter 5 (e.g., minimizing edge).

- An assessment of compliance with the Stay-Ahead provision (Section 8.6.1 *Stay-Ahead Provision*) and a forecast of expected take and land acquisition needs for the next 2 years.
- An accounting of all revenues received, by type (e.g., development fees, wetland fees, grants) and an assessment of progress towards total revenue goals. Funding from local, state, and federal sources must be tracked separately. Any fee adjustments must also be reported.
- An evaluation of the economic assumptions on which the Plan was based (e.g., Plan costs, revenue rates and grant funding projections).
- An assessment of progress toward a complete funding strategy for implementation after the permit term (Chapter 9, Section 9.4.2, subheading *Interest Income*).
- A summary of all land and water management activities undertaken on and off the reserves and a discussion of the management issues facing the Implementing Entity.
- A presentation of the conceptual ecological models developed to date and any changes to them that have taken place.
- A description of the landscape-, natural community-, and species-level monitoring undertaken during the reporting period and a summary of monitoring results, including species status and trends.
- A description of the adaptive management process utilized during the reporting period (e.g., consultation with science advisors, convening of the Independent Conservation Assessment Team).
- A summary of the recommendations or advice provided by the Wildlife Agencies, science advisors, and the Independent Conservation Assessment Team (if applicable) regarding adaptive management and monitoring.
- A summary of the monitoring program objectives, techniques, and protocols including monitoring locations, variables measured, sampling frequency, timing, and duration, analysis methods, and who performed the analyses.
- An assessment of the efficacy of the monitoring and research program and recommended changes to the program based on interpretation of monitoring results and research findings.
- An assessment of the efficacy of habitat restoration and creation methods in achieving performance objectives and recommended changes to improve the efficacy of the methods.
- A description of all Habitat Plan directed studies undertaken during the reporting period; a summary of study results; and a description of integration with monitoring, assessment, and compliance elements.
- An assessment of the appropriateness of performance indicators and objectives (see **Table 7-1** for examples) based on the results of effectiveness

monitoring, and recommended changes to performance indicators and objectives.

- An assessment of changes in temperature in the study area (see Chapter 10, Section 10.2.1 *Changed and Unforeseen Circumstances*).
- A description of any actions taken or expected regarding changed circumstances, including remedial actions.
- A description of any unforeseen circumstances that arose and responses taken.
- A year-to-date and cumulative summary of Certificates of Inclusion issued for Neighboring landowner agreements, including the size and location of lands covered by them.
- A summary of any administrative changes, minor modifications (e.g., updates to **Figure 2-5**), or major amendments proposed or approved during the reporting year (see Chapter 10, Section 10.3 *Modifications to the Plan*).

Federal guidelines for the contents of monitoring reports also recommend inclusion of biological goals and objectives in these reports. However, **Tables 5-1a-d and 5-2a-b** serve this purpose. Therefore, biological goals and objectives do not need to be reported annually (progress towards meeting the goals and objectives will be reported, however).

Electronic copies of the following data will be provided upon request to the Wildlife Agencies and to the public<sup>18</sup>.

- Copies of all non-confidential, non-proprietary portions of the database that track covered activities and land acquisition in the possession and control of the Implementing Entity in its current state.
- Copies of all relevant GIS data in possession and control of the Implementing Entity in its current state, including land cover, the location of covered activities, and the boundaries of the current Habitat Plan Reserve System.
- Copies of all non-confidential, non-proprietary financial data in possession and control of the Implementing Entity in its current state.

## 8.12 Schedule and Deadlines

To ensure a successful Plan, the Implementing Entity will make progress on a variety of tasks simultaneously. Tasks during the first several years of implementation will be particularly important to ensure positive momentum and early compliance with Plan terms and conditions. Schedule guidelines and major deadlines for Plan implementation are presented in **Table 8-1**. Tasks are divided

<sup>18</sup> Data provided to the public will be subject to any restrictions on proprietary or confidential data or services that may be utilized by the Implementing Entity such as proprietary aerial photos, parcel databases, confidential species locations, or pending land transactions.

among the Permittees, Cities and County, and the Implementing Entity. The Implementing Agreement will establish deadlines for certain tasks.

**Table 8-2** lists those key implementation tasks with deadlines that are tied to permit compliance. As described in the table, these deadlines have various levels of flexibility depending on the circumstances. Implementation deadlines are important to establish a mutual understanding among the Permittees and the Wildlife Agencies about how the Plan will be implemented over time and to ensure that the Plan will be implemented in a timely manner. However, the Permittees and the Wildlife Agencies recognize that under certain circumstances, modifications to the deadlines beyond the flexibility provided in **Table 8-2** could be reasonable and appropriate. The Implementing Entity may modify, with the approval of the Wildlife Agencies, the deadlines through minor modifications or major amendments to the Plan, as described in Chapter 10, Section 10.3 *Modifications to the Plan*.

Before permits are issued, the Local Partners will set the groundwork for Plan implementation by establishing the implementation organization. Grant writing, land acquisition, and training of local jurisdiction staff may also commence before permit issuance. During the first 6 months of the permit term, emphasis will be placed on hiring key administrative staff for the Implementing Entity (or contracting out their functions), establishing the Public Advisory Committee, establishing local ordinances required to fund and implement the Plan, and developing implementation tools. At initiation of the permit term, tasks of grant writing, land acquisition, and Plan implementation training will transfer from the Permittees to the Implementing Entity or its agent (e.g., a local land management agency). During the permit term, the Implementing Entity will be responsible for these tasks. Both the local jurisdictions and the Implementing Entity will be responsible for collecting development fees throughout the permit term. Within the first year, the Implementation Entity will secure necessary staff and contract resources, identify scientific advisors, create a Plan implementation web site, establish the required database, and investigate wetland restoration opportunities.

Over the next 5 years, additional Reserve staff will be hired or contracted, and more specific reserve unit management plans will be created and initiated to manage and monitor the expanding Reserve System. Environmental compliance and design for wetland restoration and creation will be initiated. The Implementing Entity will also begin to develop strategies for post-permit funding for monitoring and management. Beginning with this period and extending throughout the remaining permit term, fees will be updated and adjusted on a regular basis, and conservation assessments will be conducted. In addition, the hiring and contracting of staff will be completed to manage the Reserve System and implement the Plan. Habitat restoration and design will continue, as will the adaptive management and monitoring of biological resources.

Between Years 6 and 50, the Implementing Entity will continue to implement the conservation strategy, implement monitoring and adaptive management, and refine these programs as monitoring and other data are collected. Land acquisition that will require restoration or creation must be completed by Year 40. All other land acquisition must be completed by Year 45, and

construction of all restoration and creation projects must be completed by Year 40 of the permit term. (See Chapter 9 for a discussion of funding adequacy to meet these deadlines.)

Before the end of the permit term, the Implementing Entity will also determine the administrative structure necessary to continue management on the Reserve System in perpetuity. For example, management responsibility may be delegated to one of the Permittees to continue to oversee in perpetuity. Alternatively, the Joint Powers Authority may extend its term to continue to oversee implementation of the Habitat Plan.

**Table 8-1.** Schedule for Major Implementation Tasks

<b>Time Period</b>	<b>Tasks and Milestones</b> (**Key Task Tied to Permit Compliance; see <b>Table 8-2</b> ) [If applicable, Habitat Plan reference included]	<b>Responsible Party<sup>1</sup></b>
<b>Prior to Permit Issuance (i.e., Year 0)</b>		
	Complete final versions of Implementing Agreement, Joint Exercise of Powers Agreement, and Permittee ordinances in preparation for permit issuance and Implementing Entity formation. [Chapter 8, Section 8.5]	Local Partners
	**Establish Implementing Entity through execution of the Joint Exercise of Powers Agreement. File with State Secretary of State within 30 days of its effective date. [Chapter 8, Section 8.2.2]	Local Partners
	**In accordance with the Implementing Agreement and Joint Exercise of Powers Agreement, establish Habitat Plan implementation organizational structure (i.e., Implementing Entity's Governing Board and Implementation Board). [Chapter 8, Section 8.2]	Local Partners
	Where feasible, apply for state/federal grants for land acquisition (after publication of Draft Habitat Plan). [Chapter 8, Section 8.3.5; Chapter 9, Section 9.4.3]	Local Partners
	Develop template Habitat Plan application package for use by private applicants and Permittees that includes all items required in Chapter 6, Section 6.8 (Items 1 through 6).	Local Partners
	Develop a checklist prior to the first ordinance taking effect for local planners to evaluate the Habitat Plan application package. This will help ensure compliance by each project receiving coverage under the Plan. The checklist must include a statement of certification that project applicants meet the relevant terms of the Habitat Plan. [Chapter 6, Section 6.7.2]	Local Partners
	Prepare a template form prior to the first ordinance taking effect for local planners to document that a private applicant's project is consistent with the Plan. This consistency determination will be made based on the checklist described above. [Chapter 6, Section 6.7.2]	Local Partners
	Provide each Permittee with Plan maps (e.g., fee zone, land cover, private development coverage, modeled habitat) to allow local agency staff to process and evaluate applications for Habitat Plan coverage or evaluate their own projects under the Plan. [Chapter 2, Chapter 6, Chapter 9]	Local Partners
	Train local jurisdiction staff to review and process Habitat Plan applications. This task will be ongoing.	Local Partners
	Commence the recruitment process for Implementing Entity Administrative Director and key staff (if possible, to allow early implementation). [Chapter 8, Section 8.3.2]	Local Partners
<b>By Permit Issuance (Day 1)</b>		
	Prepare initial budget for Implementing Entity.	Permittees
<b>Post-Permit</b>		
0–6 months	Hire Implementing Entity Administrative Director and key staff (if not completed prior to permit issuance). This task will be ongoing. [Chapter 8, Section 8.2.2]	Implementing Entity

Time Period	Tasks and Milestones (*Key Task Tied to Permit Compliance; see <b>Table 8-2</b> ) [If applicable, Habitat Plan reference included]	Responsible Party <sup>1</sup>
	Develop a set of biologist qualifications and establish pre-approved list of biologists per Chapter 6, Section 6.8.5. This task will be ongoing.	Implementing Entity
	Develop template pre-acquisition assessment and protocols prior to the first land acquisition. [Chapter 5, Section 5.2.3, subheading <i>Field Verification Prior to Acquisition</i> , and Chapter 8, Section 8.6]	Implementing Entity
	Train local jurisdiction staff to prepare, review, and process Habitat Plan applications. This task will be ongoing.	Permittees, with ongoing assistance from Implementing Entity
	Update GIS land cover layer with aerial photographs, satellite imagery, and other relevant data sources including serpentine soils maps at the outset of implementation. [Chapter 7, Section 7.2.2 <i>Program Phases</i> , subheading <i>Inventory Phase</i> , subheading <i>Document Baseline Conditions</i> ]	Implementing Entity
	Provide each participating local jurisdiction with detailed maps of fee zones and land cover so they can process and evaluate Habitat Plan applications. [Chapter 9, Section 9.4.1]	Implementing Entity
	Review private development applications for coverage under the Habitat Plan. This task will be ongoing. [Chapter 6, Section 6.7; Chapter 8, Section 8.7]	Cities and County
	Prepare and review applications for public sector activities under the Habitat Plan to be submitted to Implementing Entity. This task will be ongoing. [Chapter 6, Section 6.7; Chapter 8, Section 8.7]	Permittees
	Establish Technical Advisory and Public Advisory committees. [Chapter 8, Sections 8.2.4 and 8.2.7]	Implementing Entity
	Where feasible, apply for state/federal grants for land acquisition. This task will be ongoing. [Chapter 8, Section 8.3.5; Chapter 9, Section 9.4.3]	Implementing Entity, Permittees
	Determine the date by which the annual automatic update of development fees will occur. [Chapter 9, Section 9.4.1 <i>Habitat Plan Development Fees</i> , subheading <i>Automatic Adjustment of Mitigation Fees</i> ]	Implementing Entity
	Collect Habitat Plan fees. This task will be ongoing. [Chapter 9, Section 9.4.1]	Cities and County, Implementing Entity
6 months– 1 year	Hire key administrative staff of Implementing Entity or secure agreements or contracts with other organizations to fulfill these roles. [Chapter 8, Section 8.2.2]	Implementing Entity, Permittees
	Establish Habitat Plan Implementation web site. [Chapter 8, Section 8.3.9]	Implementing Entity
	Investigate aquatic enhancement, restoration, and creation opportunities on existing open space and newly acquired land to ensure Stay-Ahead on wetland impacts. This task will be ongoing. [Chapter 8, Section 8.6.1]	Implementing Entity Permittees
	Establish and maintain database to track permit compliance (e.g., land acquisition and Habitat Plan impacts). This task will be ongoing. [Chapter 8, Section 8.10.1]	Implementing Entity, Permittees

Time Period	Tasks and Milestones (**Key Task Tied to Permit Compliance; see <b>Table 8-2</b> ) [If applicable, Habitat Plan reference included]	Responsible Party <sup>1</sup>
1–5 years	Continue to hire or contract out Implementing Entity technical and operational staff as Reserve System expands. [Chapter 8, Section 8.2.2]	Implementing Entity
	**Update fees annually according to Chapter 9. Provide new fee schedule to Permittees. This task will be ongoing. [Chapter 9, Section 9.4.1]	Implementing Entity, Cities and County
	At intervals specified in Chapter 9, perform financial assessment. This task will be ongoing. [Chapter 9, Section 9.4.1, subheading <i>Adjustment of Mitigation Fees</i> ]	Implementing Entity
	**Submit annual report to the Wildlife Agencies. This task is performed on an annual basis by March 15 of every year for the previous fiscal year (July 1 to June 30). [Chapter 8, Section 8.11]	Implementing Entity
	Conduct annual meeting to report on implementation progress of Habitat Plan. This task will be ongoing. [Chapter 8, Section 8.2.7]	Implementing Entity
	Prepare reserve unit management plans as described in Chapter 5 for the five expected reserve units. <ul style="list-style-type: none"> <li>• Upper Penitencia Creek,</li> <li>• Coyote Ridge,</li> <li>• Pacheco Watershed,</li> <li>• Southern Santa Cruz Mountains, and</li> <li>• Santa Teresa Hills.</li> </ul> ** Plans must be prepared within 5 years of the first parcel acquired in each reserve unit and updated as needed, but reviewed no less than every 5 years [Chapter 5, Section 5.2.5]	Implementing Entity
	Initiate adaptive management and monitoring of biological resources. This task will be ongoing. [Chapter 7]	Implementing Entity
	Establish pool of science advisors to provide technical advice to Implementing Entity and Permittees on monitoring and adaptive management. This task will be ongoing. [Chapter 7, Section 7.2.3; Chapter 8, Section 8.2.6]	Implementing Entity
	Initiate or continue management and monitoring in Reserve System. [Chapter 5, Section 5.2.5 and Chapter 7, Section 7.1.4]	Implementing Entity t
	**Continue to acquire land to assemble Reserve System and meet Stay-Ahead provision requirements (by Year 2). This task will be ongoing; however, all land acquisition must be completed by Year 45. [Chapter 5, Section 5.3.1; Chapter 8, Section 8.6.1]	Implementing Entity Permittees
	Begin wetland restoration and creation design and additional environmental compliance for restoration and creation. This task will be ongoing. [Chapter 5, Sections 5.3.6 and 5.3.7]	Implementing Entity

Time Period	Tasks and Milestones (**Key Task Tied to Permit Compliance; see <b>Table 8-2</b> ) [If applicable, Habitat Plan reference included]	Responsible Party <sup>1</sup>
	Implement plant and aquatic land cover restoration and creation projects described in Chapter 5. This task will be ongoing; however, construction of all habitat restoration and creation projects for land-cover types and plant occurrences (Coyote ceanothus, smooth lessingia, and Metcalf Canyon jewelflower) must be completed by Year 40. [Chapter 5, Sections 5.3.1, 5.3.7, 5.4.11, 5.4.16, and 5.4.17; Chapter 8, Sections 8.12 and 8.6.1]	Implementing Entity
	Open selected reserves to public access according to reserve unit management plans. Develop enforcement procedures for the Reserve System before newly acquired land (excluding existing open space added to the Reserve System) is open to public access. [Chapter 6, Section 6.4.6. subheading <i>Condition 9</i> ; Chapter 8, Section 8.3]	Implementing Entity or applicable local agencies
	Begin implementation of required studies and prioritize implementation of remaining studies described in Chapter 5. [Chapter 7, Sections 7.2.1 and 7.2.2]	Implementing Entity
	Update land cover map with most recent aerial photograph and provide to local jurisdictions implementing the Plan (at least every 5 years). This task will be ongoing. [Chapter 7, Section 7.3.1]	Implementing Entity
	Develop a wildfire local operating agreement for the Reserve System with Cal Fire and with any other firefighting agency that has responsibility for the Reserve system lands within 4 years of permit issuance. [Chapter 5, Section 5.3.2, subheading <i>Fire Management</i> ]	Implementing Entity
	By the beginning of Year 4, renew the MBTA Special Purpose Permit for least Bell's vireo for another 3-year term. [Chapter 6, Section 6.3]	Implementing Entity
	By Year 5, develop stream management guidelines for private landowners, including an educational program to assist in the implementation of the guidelines (other public education and outreach tasks are also required, but do not have specific deadlines; see text). [Chapter 5, Section 5.3.2, subheading <i>Public Education and Outreach</i> ; Section 5.3.5, subheading <i>Private Landowner Education</i> ]	Implementing Entity
	At Year 5 and every 5 years afterwards, establish Independent Conservation Assessment Team and conduct assessment of entire conservation program. [Chapter 7, Section 7.2.3; Chapter 8, Section 8.2.6]	Implementing Entity
6–50 years	**Determine the target population size of Mount Hamilton thistle, fragrant fritillary, and Loma Prieta hoita by Year 10. [Chapter 5, Sections 5.4.12, 5.4.14, and 5.4.15]	Implementing Entity
	Initiate feasibility study when adequate monitoring data exist on wildlife movement in three focal areas described in Chapter 5, Section 5.3.2 or by year 10 of implementation, whichever comes first. [Chapter 5, Section 5.3.2]	Implementing Entity
	In year 20 of implementation, work with the Wildlife Agencies to conduct a formal and complete review of progress toward building the Reserve System. [Chapter 7, Section 7.2.3 <i>Program Implementation</i> , subheading <i>Program Infrastructure</i> ]	Implementing Entity

Time Period	Tasks and Milestones (**Key Task Tied to Permit Compliance; see <b>Table 8-2</b> ) [If applicable, Habitat Plan reference included]	Responsible Party <sup>1</sup>
	Finalize post-permit implementation structure prior to permit expiration. [Chapter 8, Section 8.12]	Implementing Entity
More than 50 years	Continue adaptive management and limited monitoring of biological resources to ensure management actions are working. [Chapter 7]	Implementing Entity

<sup>1</sup> The responsible party is the entity that must ensure the task or milestone is achieved. In many cases, the responsible party may delegate implementation of the task to a third party (e.g., a Permittee, landowner, or consultant).

**Table 8-2.** Key Deadlines for Plan Compliance

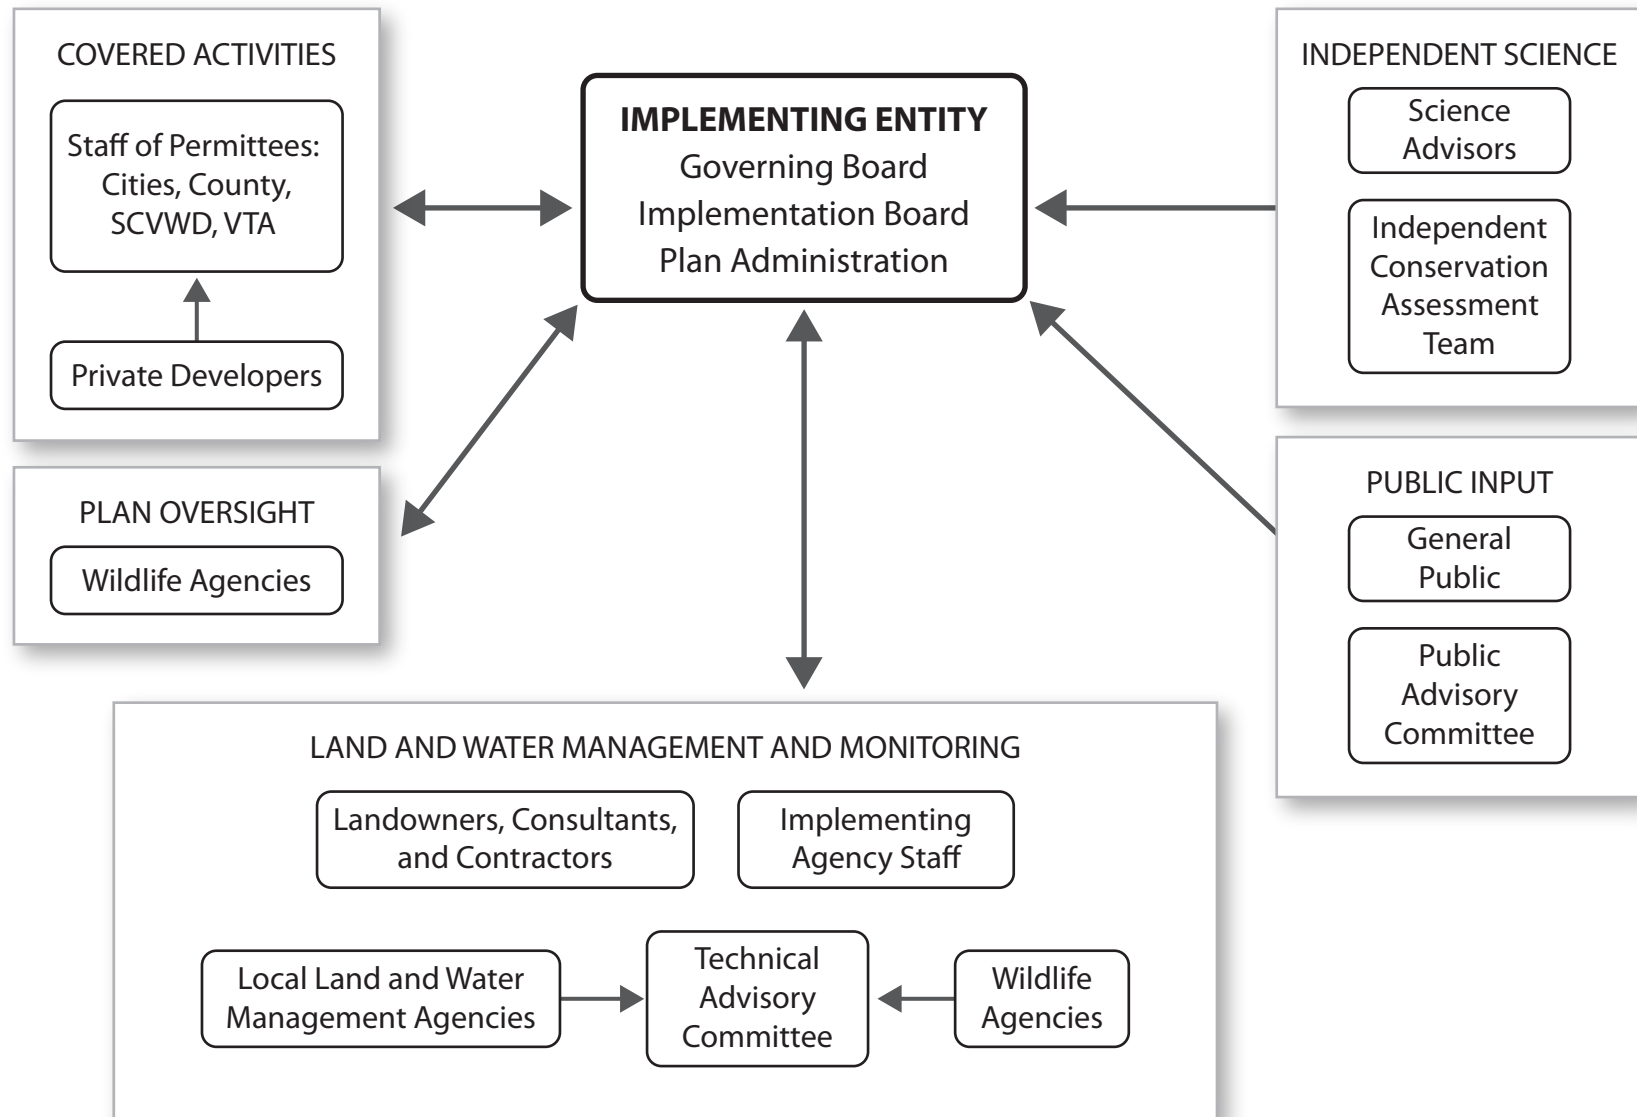

Key Implementing Entity Task With Deadline Tied to Permit Compliance <sup>1</sup>	Deadline(s)	Habitat Plan Reference	Deadline Flexibility
<b>Key Initial Deadlines</b>			
In accordance with the Implementing Agreement and Joint Exercise of Powers Agreement proposals, establish Habitat Plan implementation organizational structure (i.e., Implementing Entity's Governing Board and Implementation Board)	Prior to issuance of permits by Wildlife Agencies so that Implementing Entity can be issued the permits	Chapter 8, Section 8.2	The Permits will not cover the Implementing Entity's activities until the Implementing Entity has been formed and has submitted an application
Cities and County will consider the adoption of local ordinances to implement Habitat Plan	Within 120 days after the execution of the Implementing Agreement and the last permit is issued by the Wildlife Agencies	Chapter 8, Section 8.5	None
<b>Key Annual Deadlines</b>			
Update fees annually according to Chapter 9	Date to be determined by the Implementing Governing Board within the first 6 months of Plan implementation	Chapter 9, Section 9.4.1, subheading <i>Automatic Adjustment of Mitigation Fees</i>	Fee update can be delayed if the federal indices in <b>Table 9-9</b> are delayed
Submit annual report to Wildlife Agencies with all required information	By March 15 of each year for the previous fiscal year (July 1 to June 30)	Chapter 8, Section 8.11	Extensions available with prior approval by Wildlife Agencies
<b>Key Periodic or One-Time Deadlines</b>			
Prepare reserve unit management plans	Within 5 years of first acquisition in each reserve unit	Chapter 5, Section 5.2.5	Extensions available with prior approval by Wildlife Agencies
Acquire and enhance land; restore riparian woodland/scrub, wetlands, and streams; and create ponds in compliance with the Stay-Ahead Provision	Applies 2 years after the last ordinance takes effects and is measured annually thereafter	Chapter 8, Section 8.6.1	10% deviation below Stay-Ahead requirements is allowed
Determine the target population size of Mount Hamilton thistle, fragrant fritillary, and Loma Prieta hoita	Year 10	Chapter 5, Sections 5.4.12, 5.4.14, 5.4.15	Extensions available with prior approval by Wildlife Agencies
The Implementing Entity will work with the Wildlife Agencies to conduct a formal and complete review of progress toward building the Reserve System	Year 20	Chapter 8, Section 8.6.1	None

Table 8-2. Continued

Key Implementing Entity Task With Deadline Tied to Permit Compliance <sup>1</sup>	Deadline(s)	Habitat Plan Reference	Deadline Flexibility
Restore riparian and fresh water marsh and create ponds to contribute to species recovery	Years 15, 30, 40	Chapter 5, <b>Table 5-14</b>	Extend deadline by up to one year with approval of Wildlife Agencies if Implementing Entity demonstrates progress towards milestone
Complete construction of all restoration and creation projects for land cover types and plant occurrences (Coyote ceanothus, smooth lessingia, and Metcalf Canyon jewelflower)	Year 40	Chapter 5, Section 5.3.1 subheading <i>Acquisition and Restoration Requirements for Aquatic Land Cover Types</i> , and Chapter 5, Sections 5.4. 11, 5.4.16, and 5.4.17	Success criteria for created plant populations, created ponds, and restored riparian/wetlands will be proposed in reserve management plans and restoration/creation designs. Success criteria in some cases may not need to be demonstrated by year 40, but would have to be demonstrated by the end of the permit term. The Wildlife Agencies would review these proposals as they are submitted during Plan implementation
Acquire all land for the Reserve System according to the acreage requirements in Chapter 5 by land cover type, conservation analysis zone, and landscape linkage	Year 45	Chapter 5, Section 5.3.1; <b>Tables 5-11, 5- 17, 5-18; Figure 5-9</b>	Extend by up to two years with Wildlife Agency approval if Reserve System is within up to 5% of completion
Acquire modeled habitat for covered species in the Reserve System according to the requirements in Chapter 5	Year 45	Chapter 5, <b>Table 5-19</b>	Extend by up to two years with Wildlife Agency approval if Reserve System is within up to 5% of completion
Develop a Wildlife Agency-approved plan to address the continuing obligations of the Implementing Entity beyond the permit term	Year 45-47	Section 9.4.4 subheading <i>Funding for Post-Permit Management and Monitoring</i>	None
<sup>1</sup> Responsibility for all tasks lies with the Implementing Entity unless otherwise stated.			

**Figure 8-1**  
**Relationship of the Implementing Entity to External Parties**

**Figure 8-2**  
**The Functions and Roles of the Implementing Entity**

a. Theoretical rate of impacts and conservation if impacts occur at an even rate (linear) throughout the permit term.

b. Theoretical rate of impacts and conservation if most impacts occur early in permit term.

## **9.1 Introduction**

This chapter describes the method used to estimate the financial resources (costs) and funding needed to implement the Habitat Plan over the 50-year planning horizon. Fees and other funding sources that support implementation of the Plan are identified, as is the funding needed to support ongoing management of the Reserve System after the permit term ends and funding adequacy.

As described in Chapter 1, as of the completion of this Plan the Local Partners were working with the Corps to develop a Regional General Permit for this Plan. Any additional costs associated with implementing the Regional General Permit are not accounted for in this chapter.

## **9.2 Cost to Implement the Habitat Plan**

Estimating the full costs of the Habitat Plan was an essential step to demonstrate adequate funding necessary to meet regulatory standards. In order to provide enough funding, all costs associated with the conservation actions had to be identified. Because of the geographic scale of the Plan, the complexity of the conservation actions, and long time scale over which these actions will occur, the cost estimating process involved many assumptions. These costs are identified for planning purposes only to estimate funding levels needed to implement the Plan. The Implementing Entity will be responsible for annually preparing and approving a budget for Plan Implementation, based on current information and projections regarding Habitat Plan assets, revenues and expenses.

Major cost categories are listed below and summarized in this chapter.

- Land acquisition.
- Reserve management and maintenance, including adaptive management.
- Habitat and covered plant occurrence restoration/creation.
- Monitoring, research, and scientific review.
- Program administration.

- Contingency.
- Costs in perpetuity.

The anticipated cost of each category is shown in **Table 9-1** which summarizes total costs, capital costs, and operational costs for the Habitat Plan. All costs are in 2010 dollars<sup>1</sup>. Costs are also estimated after the permit term as an average annual cost. Cost components expected after the permit term in perpetuity are described in Section 9.3.7 *Costs in Perpetuity*.

## 9.3 Cost Estimate Methodology

To estimate Plan costs, a cost model was developed that identified specific costs in the major cost categories (listed above) needed to fulfill terms and conditions of the Plan (**Appendix G** provides the assumptions and output of the model). The cost model was designed to demonstrate that Plan-related costs were accounted for and reasonably estimated. The model structure was refined and expanded from cost models developed for three large, complex regional HCPs and NCCPs<sup>2</sup>. The goal of the cost model was to conservatively estimate expenses of the Implementing Entity over the permit term so that overall costs are understood. This allows the Local Partners to estimate costs over the lifetime of the Plan and post-permit costs so that funding needs can be determined and a fee structure developed.

During Plan implementation, the cost model can be updated to assist the planning process as the assumptions are refined. Model assumptions are listed and described below by cost category and built into the model to facilitate updates. It is assumed that all cost components will increase due to inflation over time; as such, these were tied to cost-of-living statistics<sup>3</sup>. Cost assumptions for operations, maintenance, and administration were developed using local comparable cost data from land management agencies in the study area (County Parks and Open Space Authority) and the Local Partners when available, and from other sources where data from local agencies were unavailable<sup>4</sup>. A separate land valuation analysis was used to develop land acquisition cost estimates (see Section 9.3.1 *Land Acquisition* for more detail).

While the Implementing Entity is responsible for ensuring implementation of all of the requirements described in Chapter 8, it is assumed that the Implementing Entity will leverage the resources of Local Partners when possible to use funding as efficiently as possible. As such, it is expected that local land

<sup>1</sup> Costs will vary over the 50-year permit term primarily due to the size of the Reserve System. To predict the general timing of funding needs, costs are summarized by 5-year periods except for Year 0, which contains initial start-up expenses. However, the cost model will be used during implementation to forecast start up costs.

<sup>2</sup> The Lower Colorado River Multi-Species Conservation Plan (approved), the East Contra Costa County HCP/NCCP (approved), and the Placer County Conservation Plan (an in-process HCP/NCCP).

<sup>3</sup> The Consumer Price Index (CPI) for the San Francisco-Oakland-San Jose Metropolitan Service Area from the U.S. Bureau of Labor Statistics was used as needed to increase cost estimating factors during the planning process.

<sup>4</sup> Model cells are color-coded to indicate data sources. See **Appendix G**.

management agencies and other entities will perform many of the functions of the Implementing Entity. In this case, the Implementing Entity will be “outsourcing” implementation tasks to these organizations and paying them to act on the Implementing Entity’s behalf. The costs summarized in this chapter are therefore estimates of expenses incurred by the Implementing Entity or payments to contract agencies, landowners, consultants, or contractors to perform their work.

The assumptions used to develop land acquisition and management costs warrant additional discussion. Several acreage figures appear only in the cost model and do not correlate to conservation strategy requirements. The total size of the Reserve System will be at least 46,496 acres and up to an estimated 46,920 acres (Chapter 5). This includes 33,205 to 33,629 acres of new acquisitions that fulfill specific land cover requirements. However, the cost model assumes that new acquisitions for the Reserve System will total 36,100 acres (**Table 9-2**). This is because the cost model assumes that some “non-target” acres will be acquired in addition to targeted land cover types. For example, an acquired parcel may include land cover types without acquisition, restoration, or creation requirements, such as agricultural or developed land cover types. In addition, up to 13,291 acres of existing open space will be contributed to the Reserve System (**Table 5-5** and **Table 9-2**). Acreages used to estimate management and monitoring costs are based on acreages consistent with the conservation strategy (**Table 9-3**) and do not assume management or monitoring costs for the “non-target” land cover types that are included in the acquisition costs.

Details of each cost category and the key assumptions that were used to develop the Habitat Plan cost estimate are described below. The costs in perpetuity are described in Section 9.3.7 *Costs in Perpetuity*. See the cost model in **Appendix G** for an accounting of all assumptions.

### 9.3.1 Land Acquisition

Land acquisition is the biggest component of overall Plan costs and acres of acquired land provides the foundation for estimating operational (management and monitoring) costs. Land acquisition is needed to develop the Reserve System to: 1) mitigate impacts from public and private sector development authorized by permits issued for the Habitat Plan, and 2) contribute to the recovery of the covered species.

The proposed Reserve System has two integrated land elements:

1. new land that is acquired (in fee or by easement) to meet the conservation strategy requirements described in Chapter 5 and summarized in **Table 5-13**; and
2. existing open space that is managed to support recovery of covered species.

Existing open space areas proposed for enrollment into the Reserve System have been evaluated to ensure that they offer opportunities to achieve notable benefits

for covered species through additional land management. However, these lands were not included in the land acquisition analysis as they are existing open space.

Land acquisition costs include the price of the land or conservation easement, land transaction costs, and initial site improvements required upon purchase.

## Land Acquisition Costs

Land acquisition capital costs, including site improvements, are estimated to be approximately 72% of all capital costs, or approximately \$268 million (**Table 9-1**). This estimate relies on the assumption that 50% of newly acquired lands would be acquired in fee title (as opposed to conservation easement), and that a conservation easement is 80% of the cost of fee title. This assumption of 50% fee title acquisition applies to all acquisitions, except for those on the valley floor. On the valley floor, all lands are assumed to be acquired in fee title. As such, the resulting overall percent of fee title acquisitions is assumed to be 52%. Gifts of land or transfer of a conservation easement associated with a development project may occur and would reduce land acquisition costs. However, for the purposes of the cost estimate none were assumed. **Table 9-2** provides a summary of land acquisition acreages.

For this cost model, fee title land values were based on a review of comparable private market sales of open space lands in Santa Clara County and interviews with appraisers, real estate brokers, and land management agencies active in the region<sup>5</sup> and values based on parcel size categories and location in the study area<sup>6</sup>. The land acquisition cost factors used in this cost estimate range from \$6,000 per acre to \$34,000 per acre. The actual sale price of individual properties over the permit term will vary considerably.

For planning purposes, fee title and conservation easement land acquisitions are assumed to occur evenly through time over the course of the permit term. Land costs are expected to increase over time; mechanisms for addressing these increases are described in Section 9.4 *Funding Sources and Assurances*. Land acquisition and associated costs are expected to be incurred for the first 45 years of the permit term but not beyond it.

Some newly acquired land may need to be stabilized before habitat management, restoration activities, or public access can begin. Site improvements may include demolition or repair of unsafe facilities; repair of boundary fences; repair and replacement of gates; installation of signs (e.g., boundary and landmark signs); road repair and/or removal; and repair and replacement of creek crossings. Cost estimates were based on a cost per acquired parcel basis.

<sup>5</sup> See **Appendix G: Assessment of Open Space Land Sales Used in the Santa Clara Valley Habitat Plan Economic Analysis**.

<sup>6</sup> Parcels sizes were grouped into one of three categories: less than 50 acres, 50–250 acres, and greater than 250 acres. The location analysis was based on the five zones that match those defined for the impact assessment of rural development (Section 4.4.1 *Direct Effects* and **Figure 4-1**).

## Land Transaction Costs

Land transaction costs cover due diligence activities related to parcels considered for acquisition and reconnaissance-level biological surveys (pre-acquisition surveys).

The process of investigating a parcel of land before acquiring it is considered due diligence. This includes costs for appraisal, preliminary title, boundary surveys, hazardous material assessment<sup>7</sup>, and legal description. The model assumes that 25% more parcels will be investigated than will be acquired.

As described in Chapters 5 and 8, pre-acquisition assessments will be required to determine the biological value of any land considered for inclusion in the Habitat Plan Reserve System. Pre-acquisition assessments include surveys for the following characterizations.

- Land cover type.
- Covered species habitat.
- Covered plant occurrences.
- Wetlands and streams (i.e., wetland delineations).
- Covered wildlife populations.
- Landscape linkages and ecosystem functions.

The model estimates the cost of pre-acquisition surveys based on the estimated number of hours per 100 acres required for each type of survey and the cost per hour, including travel costs, for consulting biologists to conduct the surveys.

Land transaction costs are expected only during the first 45 years of the permit term of the Habitat Plan. Land transaction costs will end once the Reserve System has been fully assembled before Year 45 of the permit term.

### 9.3.2 Reserve Management and Maintenance (Including Adaptive Management)

Once lands have been acquired, the Habitat Plan sets out a program to ensure that the reserves are managed to achieve the biological goals and objectives identified in Chapter 5. Support for reserve management and maintenance must be

---

<sup>7</sup> A *Phase 1 Site Assessment* is a preliminary investigation to determine if a site might contain hazardous materials. Sites with hazardous materials will be evaluated for potential cleanup; these costs will be weighed against the effect on the Reserve System design should the site not be protected, and a determination will be made whether the site should still be acquired. For costing purposes, it is assumed that sites with positive Phase 2 Assessment results (i.e., sites that may contain hazardous materials) will not be added to the Habitat Plan Reserve System because hazardous material cleanup would be required (sites with hazardous materials with legal mandates for cleanup may still be acquired if they support valuable or unique biological resources).

sufficient to cover the ongoing management and maintenance needs of the Reserve System. These activities are estimated to be \$95,360,000 over the term of the permit, or an average of about \$1,910,000 annually during the permit term (**Table 9-1**). The estimated cost to manage the Reserve System relied on the size of the Reserve System, the number of Implementing Entity staff (or contract equivalent), and the time period of the permit term. Accordingly, these costs are expected to increase with the size of the Reserve System. However, costs will not grow directly in proportion to the size of the Reserve System because per-acre management costs are expected to eventually decrease due to efficiencies of scale. **Table 9-3** provides a summary of the per acre cost of reserve management and monitoring activities over the permit term. Costs estimates related to management and maintenance activities include those listed below.

- Reserve System staff.
- Purchase of passenger and maintenance vehicles, vehicle repair, and fuel (vehicle insurance is included in Program Administration).
- Leasing vehicles or heavy equipment.
- Construction, maintenance, and operation of field facilities (e.g., workshops) and associated equipment.
- Pre-construction surveys for construction of field facilities.
- Purchase of management equipment and materials (e.g., hand-held tools, safety equipment, irrigation supplies, construction materials, etc.).
- Construction and operation of wells and water pumping facilities.
- Habitat enhancement of all natural communities within the Reserve System, focused on improving conditions for the covered species.
- Invasive species control (e.g., use of herbicides or grazing).
- Enhancement of covered plant occurrences.
- Conservation actions specific to western burrowing owl.
- Maintenance of ponds (e.g., dam repair, dredging).
- Adaptive management, including staff time to evaluate the results of monitoring and external research to determine the effectiveness of reserve management. These costs include staff time and equipment needed to adjust management prescriptions to respond to the changing needs of the species and natural communities in the Reserve System as well as implementation of management actions within the adaptive management framework.
- Developing or maintaining grazing infrastructure for conservation actions, including grazing fences, leases, etc.
- Development of reserve unit management plans for each reserve unit (defined in Chapter 5).
- Construction and maintenance of facilities (e.g., fencing, gates, roads, bridges, culverts) and planning activities.
- Environmental compliance requirements (described below).

■ Remedial measures for changed circumstances (described below).

Management activities may be implemented by the Implementing Entity, Local Partner staff, contractors, landowners, or other third parties. Management activities will be undertaken as efficiently as possible given existing constraints. For example, while herbicide application is permitted under the Plan, the County's IPM Ordinance restricts such use. As such, flexibility in how certain management techniques are applied may be limited (depending on the plant species, grazing or prescribed fire may be more cost-effective alternatives).

Adaptive management and maintenance activities within the Reserve System will include any change in the management and maintenance of the Reserve System necessary to meet the goals and objectives described in Chapter 5. These changes will be informed by monitoring described in Chapter 7. Adaptive management and maintenance could include, but are not limited to, enhancement of the permit area through planting, salvage of plants and replanting in a reserve, seed collection for storage in a seed bank, seed bank fees to establish and maintain seed banks, and providing onsite assistance to and oversight of contractors.

As currently designed, the adaptive management decision-making process will be part of the regular duties of Implementing Entity staff. Therefore, costs associated with adaptive management except for external scientific review were assumed to be part of the capital and operational costs of reserve management, including staff time devoted to reserve management.

Reserve management and maintenance employees will have access to the office space of the Habitat Plan Reserve System (covered under the program administration cost category), but their primary office space is assumed to be a field facility. Field facilities are small buildings that will house workshop space, equipment, a manager's office, a shared office for field staff, a locker room, and restrooms. Field facilities also include secure covered parking for maintenance vehicles. The cost for constructing and maintaining the facilities and parking areas is included in the maintenance and management category. The number of field facilities in operation is based on the size of the Reserve System. The estimated cost per year for field facility maintenance and utilities is included for each facility.

Management and maintenance vehicles purchased by the Implementing Entity include four-wheel-drive trucks, all-terrain vehicles (ATV), and ATV trailers. Vehicle and fuel costs are based on the number of each type of vehicle purchased and retired during each 5-year period, the purchase price of each type of vehicle, and fuel and maintenance costs per each type of vehicle per year. Costs are also assumed for renting large equipment as needed including small tractors, loaders, flails, larger tractors, dump trucks, and fire trucks.

The cost for maintenance equipment and materials is based on the estimated cost of equipment and materials per 1,000 acres of reserve per year and the area of reserve in each 5-year period. Maintenance equipment and supplies include but are not limited to hardware, weed control (whips, mowers, flail, herbicide sprayers, seeders), firefighting equipment (e.g., fire pumper, backpack pump,

hand tools), small tools, safety equipment, raingear, small pumps, generators, saws, demolition hammers, cargo containers, water pipes, irrigation supplies, landscape plants, fencing materials (grazing infrastructure), and lumber.

Water will be pumped into existing stock ponds as needed to maintain water levels for their habitat value for covered species and native biological diversity<sup>8</sup>. It is assumed that wells will need to be drilled and pumps will need to be purchased. Water costs are based on the estimated annual cost for well drilling and water pumping per 1,000 reserve acres and the total amount of reserve area in each 5-year period.

Contractors and landowners are expected to be needed for many of the reserve management tasks including but not limited to the following.

- Development of reserve unit management plans.
- Road and bridge construction, maintenance and repair.
- Pond maintenance.
- Major or specialized invasive species management (e.g., pig control, large infestations of yellow-star thistle).
- Preconstruction surveys required in Chapter 6 for management actions that disturb soil (e.g., field facility construction, new fencing).
- Large-scale mowing for fire breaks.
- Fence maintenance and repair.
- Alarm installation and maintenance at field offices.

Involvement of contractors in management planning will likely be higher in the first 5 years of Habitat Plan implementation due to the time required to hire and train Implementing Entity staff and the need for many management plans early in implementation. Implementing Entity staff will be expected to assume most of the management planning work by Years 6–10. Contractor costs are based on the annual amount estimated to be expended for each type of contractor per 1,000 reserve acres and the total amount of reserve area in each 5-year period.

Reserve management and maintenance will be required in perpetuity, although at a somewhat lower level than during the permit term.

## Environmental Compliance

Reserve management activities must comply with environmental requirements as described in Chapter 8 *Plan Implementation*. Additional environmental compliance will be needed during implementation for certain land management

---

<sup>8</sup> Constructed ponds will be sited to minimize their need for supplemental water. Reserve System ponds will be constructed outside of the 100-year flood plain. Existing ponds that provide breeding habitat for covered species, if not sited properly, may need supplemental water to be maintained.

and restoration activities within and outside Habitat Plan reserves. Estimated costs are based on average costs for contracting the preparation and submittal of compliance documents and permit applications. Environmental compliance costs are assumed to include compliance with NEPA and CEQA, Sections 401 and 404 of the Clean Water Act (CWA), Section 106 of the National Historic Preservation Act (NHPA), Sections 1600–1607 of the California Fish and Game Code, and other miscellaneous requirements (e.g., county grading permits, road encroachment permits, stormwater pollution prevention plans). Most CEQA and NEPA compliance costs are expected to be addressed by the EIR/EIS for the Habitat Plan. However, additional CEQA or NEPA review may be required for some projects.

Environmental compliance costs are assumed to vary with the type of compliance and the size and complexity of the project. For purposes of cost estimation, Habitat Plan projects are divided into three size/complexity categories.

- Small/simple (up to 10 acres or up to 0.1 stream mile).
- Medium /moderately complex (10.1–50 acres or 0.1–0.5 stream mile).
- Large/most complex (more than 50 acres or 0.5 stream mile).

It is assumed that Section 404 CWA, Section 401 CWA, and Section 1602 California Fish and Game Code permits will be procured on a per-project basis. Because these costs are generally associated with restoration activities, compliance costs for jurisdictional waters impacts are included in *Habitat Restoration, Creation, and Covered Plant Occurrence Creation* described below. NHPA compliance is assumed to cover cultural resource inventory only when needed for projects with a federal nexus (e.g., Clean Water Act Section 404 permits). If significant cultural resources are found at a location subject to disturbance by management, restoration, or other Plan activities, the Plan activities will be relocated.

All environmental compliance costs are expected to be incurred during the permit term because they are associated with initial reserve management actions and habitat restoration/creation projects. Few environmental compliance costs are expected after Year 40 because construction of all restoration/creation projects will be completed by then. The environmental compliance costs of covered activities unrelated to conservation actions will be borne by the applicants and are not included in this cost estimate.

## Remedial Measures for Changed Circumstances

Remedial measure costs are estimated to address the reserve management response to changed circumstances (see Chapter 10 *Assurances* for a description of all changed circumstances and remedial measures). The cost estimate for remedial measures was assumed to be an additional 10% of the operational costs allocated for management activities on reserve lands. Actual allocations for remedial measures will be adjusted each year based on the inflation factors

described in Section 9.4.1 *Habitat Plan Development Fees* subheading *Adjustment of Mitigation Fees*.

The Implementing Entity will maintain sufficient financial reserves to fund remedial actions described in Chapter 10 when they arise. Starting in Year 5 of implementation<sup>9</sup>, the Implementing Entity will annually assess its funding reserves and supplement those reserves in order to fund implementation of the most expensive remedial actions that might occur in the coming 5 years, based on historic events and frequency. Funds used to supplement these financial reserves could come from outside the Implementing Entity or from within the Implementing Entity budget (i.e., funds shifted from other Habitat Plan uses). This approach will ensure that adequate funds are available immediately in the event of a changed circumstance occurring.

Annual funding for remedial measures would accrue each year and annual funding for remedial measures would grow each year in proportion of the size of the Reserve System. The combination of these two factors will lead to substantial remedial measures funding reserves generated later in the permit term. Changed circumstances described in Chapter 10 are more likely to occur on a larger scale later in the permit term due to the greater size of the Reserve System and the expected effects of climate change.

As described in Chapter 10, the Implementing Entity is required to implement remedial action if any of the changed circumstances occur. The cost assumptions are made for planning purposes and will not limit the Implementing Entity's obligation to respond to these changed circumstances. Remedial measures for the Reserve System are not required after the permit term so these costs are assumed to apply only during the permit term.

## Recreation

Recreation is not a requirement of the ESA or NCCP Act. Any recreation activities within the Reserves System will be funded by non-fee funding sources and, as such, potential costs are not reflected in the cost model. However, recreation elements for the Reserve System could include the following.

- Developing or reviewing and integrating recreation sections for each of the five reserve unit management plans (for each of the expected five reserve units).
- Constructing recreational facilities including trailhead parking areas and access roads, kiosks, gates, signage, picnic sites, emergency phones, restrooms, and multi-use trails.
- Maintaining recreational facilities.

---

<sup>9</sup> Year 5 is identified as the starting point to ensure adequate funds for remedial measures have accumulated before this time.

However, the Plan includes costs associated with public access as related to law enforcement, such as managing visitor interface with resource management areas, ensuring public safety (see Section 9.3.5, *Program Administration* subheading *Law Enforcement for Public Access*), and fire protection/suppression.

### 9.3.3 Habitat Restoration, Creation, and Covered Plant Occurrence Creation

Habitat restoration and covered plant occurrence creation costs are estimated to be \$92,630,000 over the permit period, on average, \$1,850,000, annually during the permit term (**Table 9-1**). The budget covers activities listed below.

- The cost of identifying and prioritizing potential restoration and creation sites.
- Design of restoration/creation projects.
- Development of plans, specifications, and engineering documents.
- Bid assistance.
- Pre-construction surveys for projects within the Reserve System.
- Environmental compliance (covers permitting for impacts to federal and state jurisdictional waters, and streambed alteration agreements).
- Construction within the Reserve System.
- Construction oversight and monitoring within the Reserve System.
- Post-construction monitoring and maintenance.
- Restoration and creation repair necessary to meet success criteria specified in each reserve unit management plan (monitoring component) and site restoration plans.
- Costs associated with using contractors to assist or do any of the restoration/creation components identified in the bullets above.
- Costs associated with the habitat restoration/creation employees.
- Monitoring and maintenance during and after the permit term.
- Contingency of 15% to account for the greater uncertainty in these costs (contingency costs for restoration and creation actions are independent of, and higher than, costs assumed for the general contingency fund described below in Section 9.3.6 *Contingency*).

Enhancement costs are accounted for above in Section 9.3.2 *Reserve Management and Maintenance (Including Adaptive Management)*. The land cover types that will be restored or created under the Habitat Plan are willow riparian forest and scrub, mixed riparian forest and woodland, Central California sycamore alluvial woodland, coastal and valley freshwater marsh, seasonal wetland, ponds, and streams. **Table 5-16** describes plant occurrences that will be created within the Reserve System. The cost is developed for each 5-year period

based on the area of each land cover type that is estimated to be restored during that period. For planning purposes, the pace of restoration is assumed to be constant during the permit term. The actual pace of restoration and creation activities of the land cover types listed above will comply with the Stay Ahead Provision described in Chapter 8 and the interim timing requirements described in **Table 5-14**. Restoration and creation requirements for covered plants species will always occur prior to impacts, except for the Coyote ceanothus (see Chapter 5, Section 5.4 *Benefits of and Additional Conservation Actions for Covered Species*).

Costs for restoration repair include the costs to replant restoration sites in the event that plantings fail due to site conditions, human error, animal browsing, or other factors. These costs are calculated as 15% of the cost to construct an acre or linear foot for each land cover type<sup>10</sup>. Restoration repair costs are assumed to be unnecessary once the performance standards are met. Restoration repair costs do not include costs associated with remedial measures for changed circumstances, which apply to the destruction of restoration sites from foreseeable natural disasters such as flooding and drought (see Chapter 10). Costs associated with remedial measures to deal with changed circumstances are described below in Section 9.3.2 *Reserve Management and Maintenance (Including Adaptive Management)* subheading *Remedial Measures for Changed Circumstances*.

It is expected that contractors will be hired to construct all but the smallest habitat restoration or creation projects due to the specialized equipment, plant propagation, and planting techniques needed. For large-scale projects, a great deal of labor is typically required (e.g., planting seedlings, cuttings, or container stock for riparian or oak savanna restoration projects), which only a contractor can provide. In addition, it is expected that contractors will be hired to design restoration/creation projects, create restoration/creation plans and specifications, assist with construction bids, conduct pre-construction surveys, oversee the construction of habitat restoration/creation projects, and conduct post-construction monitoring and maintenance. Contractor costs are based on the estimated contract value for each type of contract work for each 5-year period. Staff time, equipment, and vehicles for the Implementing Entity are included in this cost category to account for the time needed to hire and oversee contractor designs, specification, and construction.

Construction of all habitat restoration/creation projects will be completed by Year 40 but restoration costs will be incurred throughout the permit term.

---

<sup>10</sup> This percentage is based on the assumptions that restoration repairs will be needed on a minority of restoration projects, and these repairs will be substantially less expensive than the original construction costs. Additional contingency funds (see Section 9.3.6) could also be used to repair restoration projects, if necessary.

### 9.3.4 Monitoring, Research, and Scientific Review

Monitoring, directed research, and scientific review costs are estimated to be over \$30,230,000 over the permit term and on average, \$600,000 annually (**Table 9-1**). Like management costs, monitoring costs were estimated to increase as the Reserve System grows. Per-acre monitoring costs were developed to account for an eventual reduction in cost once staff becomes well trained, protocols are well established, and efficiencies of scale are achieved. Monitoring costs in the first two periods (Years 1 through 10) were relatively larger to account for extra time needed for training staff and working out the details of the monitoring program (e.g., variables measured, monitoring protocols, field equipment, field forms, data analysis, etc.).

The costs of monitoring restoration projects are not included in this cost category so that all restoration costs are reflected in one cost category (and fees on wetland impacts can be more easily calculated). See Section 9.3.3 *Habitat Restoration and Covered Plant Occurrence Creation* above for a description of these unique monitoring tasks and costs.

Monitoring, directed research, and scientific review are described fully in Chapter 7 and **Appendix J**. Monitoring, directed research, and scientific review costs cover the following items.

- Costs associated with Implementing Entity staff conducting some monitoring, directed research, and scientific review.
- Planning, conducting, analyzing, and reporting on monitoring of ecosystems, natural communities, and covered species within the study area.
- Planning, conducting, analyzing, and reporting on monitoring the effectiveness of conservation measures (the cost of monitoring habitat restoration/creation projects is included in the habitat restoration category).
- Monitoring the status of impacted plant occurrences (Chapter 6, Section 6.6.2, subheading *Condition 19 Plant Salvage when Impacts are Unavoidable*).
- California tiger salamander hybridization studies.
- Western burrowing owl population surveys (every 3 years) and other related monitoring.
- Research directed at management and conservation needs of the Reserve System.
- Stipends for Science Advisors and the Independent Conservation Assessment Team in scientific review and meetings.

It is assumed that Implementing Entity employees conducting monitoring, directed research, and scientific review will plan, coordinate, and report on Habitat Plan monitoring. It is assumed that contractors will collect, document, and analyze monitoring data. Contractor costs for collecting monitoring data are based on the estimated number of hours per acre required for each type of

monitoring, the area that will be covered by each type of monitoring in each 5-year period, and the cost per hour for contracting biologists to conduct the monitoring (the cost per hour includes travel costs for the contractors).

Most monitoring and research is expected to occur on the Reserve System, including existing open space identified in Chapter 5 that will be incorporated into the Reserve System. However, some monitoring and research will occur outside the Reserve System in order to achieve the goals of the monitoring program described in Chapter 7. Monitoring costs include a limited amount of monitoring that would occur off the reserves (e.g., along streams and on other public lands to support status and trend monitoring).

Scientific review costs include costs related to scientists serving on the Independent Conservation Assessment Team and scientists providing advice to the Implementing Entity throughout the permit term (see Chapter 7). The Independent Conservation Assessment team is assumed to meet once every five years and a stipend for each of the five members is included in the cost model. An annual stipend for an assumed eight scientists is also included. Stipends for scientists include travel costs. The cost of adaptive management experiments is covered under the cost for directed research and monitoring. The cost of implementing the results of adaptive management recommendations is assumed in the overall cost of reserve management.

All research costs and most monitoring costs are assumed to occur during the permit term. Some monitoring tasks will be required in perpetuity (see Section 9.3.7 *Costs in Perpetuity* for details).

### 9.3.5 Program Administration

Program administration costs are the overhead or indirect costs to support employees, facilities, equipment, and vehicles needed by the Implementing Entity to carry out Habitat Plan requirements. Program administration also includes estimated costs for insurance, legal and financial assistance, law enforcement and firefighting paid to the County and other land management agencies (e.g., County Sheriff, CalFire), and public outreach and education. Program administration costs are estimated to be \$920,000 annually during the permit term (**Table 9-1**). Some program administration costs will be necessary beyond the permit term.

Cost savings in program administration may be realized by partnering with existing land management agencies that already have staff with the required qualifications and have the infrastructure to hire and manage such staff. However, for estimating purposes it is assumed that the Implementing Entity will hire and manage its own staff in its own facilities. This assumption ensures that potential costs of staffing and program administration are not understated.

Administrative costs incurred by Permittees other than the Implementing Entity to fulfill their own responsibilities under the Habitat Plan are not included in the cost

estimates. For example, each Local Partner will incur costs when reviewing applications for take authorization from various project proponents (see Chapter 6, Section 6.3 *Conditions on All Covered Activities*). The participating cities and the County might recover these costs from applicants according to the policies in place at each local jurisdiction. The fee amounts specified in the Plan do not reflect the costs of application review by the local jurisdictions, and revenues from the Habitat Plan fees will not be used to cover these costs. Similarly, the cost of all conditions on covered activities described in Chapter 6 will be borne by the project proponents, either public agencies or private developers.

## Staff

Much of the work identified for staff positions may be accomplished by contract resources including contracts with some of the Permittees, non-profit agencies, landowners, or private entities, especially in the early phase of Plan implementation. It is assumed that the Implementing Entity will have an Administrative Director that can function both as an organizational leader and public presence of the implementation effort. It is assumed that data management and analysis, including GIS work, will be contracted to one of the Local Partners or consultants.

Up to 10.5 staff positions are identified in the cost model for the Implementing Entity. Staffing levels at the Implementing Entity will increase slowly over time as the Reserve System grows and responsibilities increase. Staff positions address administrative needs of the program as well as non-administrative needs of the Reserve System. Other staffing mixes could be used by the Implementing Entity to fulfill the obligations of the Plan; the staffing mix described below was used only for the purposes of the cost analysis.

For the purposes of the cost estimate, it is assumed that the following positions will be staffed as administrative personnel within the Implementing Entity according to the roles described in Chapter 8 *Plan Implementation*: an Administrative Director, a Budget Analyst, a Grant Specialist, a Public Education and Outreach Coordinator, and Administrative Staff (some staff are part-time). These positions are proposed for the type of role that will be required to support implementation of the Plan, but the actual staff hired may not exactly correspond to this proposal. The cost-estimates for administrative staff is almost entirely covered in the Program Administration cost category (the assistant position is shared with Reserve Management and Maintenance). Costs for non-administrative personnel in the positions of Reserve Manager/Senior Scientist, Project Manager/Conservation Planner<sup>11</sup>, and Field Staff are shared between the program administration, reserve management and maintenance, habitat restoration/creation, and monitoring, research, and scientific review cost

---

<sup>11</sup> The Project Manager will be managing and coordinating all habitat restoration and creation projects, developing and overseeing contracts and bids, and assisting with Wildlife Agency coordination. Field Staff will be conducting some of the field work necessary to operate the reserve, including conducting management actions, conducting or overseeing monitoring, and assisting with restoration projects.

categories. Staff costs for the Reserve Manager/Senior Scientist<sup>12</sup> are entirely accounted for under the Reserve Management cost category (see Section 9.3.2 *Reserve Management and Maintenance (Including Adaptive Management)* for more detail).

## Office Space and Associated Costs

All costs associated with general office operations are accounted for under the program administration category. General office costs include office space and utilities, office equipment including copy and fax machines, an office telephone system, printers, scanners, publications, digital cameras, and a radio base station.

## Staff and Associated Costs

Staff-specific costs include employee salaries; benefits (identified by a salary multiplier of 35% to include the cost of benefits such as health insurance, payroll taxes, retirement plan, worker's compensation, disability, and life insurance); computers; office furniture; office supplies; cell phones; portable radios; and training. A mileage allowance is provided for all staff. This allowance is based on a mileage allowance per employee per year and cost per mile. Travel costs are based on days of travel per year and per diem allowance per employee.

## Insurance

Insurance costs are an important part of program administration. Insurance costs were included for auto insurance for all Implementing Entity vehicles as well as for professional insurance for the Governing Board members (often known as "directors' and officers' insurance"), general liability insurance to cover public recreational use within Habitat Plan reserves, and professional liability insurance for Implementing Entity staff.

## Legal and Financial Assistance

The Implementing Entity will require legal and financial assistance during implementation. Legal resources will be needed to draft and review conservation easements, finalize land purchases, assist with negotiations, and assist with easement violations if they occur. Financial assistance will also be periodically required to review the program's cost/revenue balance and ensure that Habitat Plan fees are adjusted in line with changing land costs and inflation. Legal costs are based on the billing rate for legal contractors and the estimated time contracted per 5-year period; financial analyst costs are based on the estimated cost for financial analysis services per 5-year period. Attorneys and financial

---

<sup>12</sup> The Reserve Manager/Senior Scientist will be responsible for overall management of all reserve lands.

analysts with each local jurisdiction are expected to provide some support to the Implementing Entity.

## Law Enforcement for Public Access

The Habitat Plan Reserve System will increase the need for law enforcement services in Santa Clara County because of the visitor use of the new reserves. To address this impact, the Implementing Entity will pay to cover reserve-related public safety costs on an annual basis. The number of police officers, park rangers, deputies, or peace officers funded per 5-year period is based on the total area projected to constitute designated reserves during the specified period and the predetermined areal extent of reserve that will require the funding of one peace officer.

## Public Outreach and Involvement

The Plan includes an annual budget for the production of education materials that may include brochures; doing mailings; holding special events (e.g., groundbreakings and dedications, volunteer appreciation functions); managing volunteer groups; and otherwise involving the public in the implementation of the Habitat Plan. It is anticipated that a volunteer group of docents will be trained early in Plan implementation and that this group will lead reserve tours and conduct educational/interpretive programs. In addition, the staffing plan includes one part-time education and outreach coordinator to design and manage the outreach program (see Chapter 5 for details of this program).

### 9.3.6 Contingency

To account for uncertainties in costs, a contingency of 3% is included in the model for all costs exclusive of restoration/creation. The contingency fund will be used on a short-term basis to offset any program costs that are higher than predicted by this Plan. Contingency funds are modest because Habitat Plan fees are designed to keep pace with rising Plan costs, particularly for land acquisition (see *Development Fees* below). Contingency funds will be used only when needed to address costs beyond those predicted in this cost estimate and in annual budgets of the Implementing Entity. Contingency funds could be used for:

- buying new or repairing existing equipment,
- acquiring materials not forecast in the budgets,
- adding temporary staff to address new issues,
- acquiring land that is more expensive than planned,
- applying more expensive management techniques in response to adaptive management needs,

- conducting additional monitoring,
- addressing unforeseen administrative costs, or
- other uses.

Adaptive management needs may arise throughout the permit term in response to monitoring results or external data that dictates shifts in management techniques and protocols. Costs for routine adaptive management needs are included in the *Reserve Management and Maintenance* cost category. Additional management needs could be addressed through contingency funding. Contingency funding will generally be used to pay for expected management that simply costs more than budgeted, or for minor adjustments in management that result in higher costs. Because this contingency budget will accrue over time, it is expected to be adequate to supplement the adaptive management budget described above in Section 9.3.2 if necessary. It could also be used to fund other Plan needs.

Contingency costs are assumed to be needed only during the permit term because some Plan costs will disappear (e.g., research) and other costs will drop substantially after the permit term.

### 9.3.7 Costs in Perpetuity

As described above, some costs are expected to be incurred only during the permit term (acquisition, restoration, environmental compliance, remedial measures, and contingency), while others can be expected after the permit term. Because most of the impacts of the covered activities are permanent (see Chapter 4), many of the conservation actions must be implemented permanently. For example, land acquired for the Reserve System must continue to be managed beyond the permit term to ensure that it retains the biological values enhanced during the permit term. Similarly monitoring must continue beyond the permit term to ensure that management actions are effective.

Overall, annual costs beyond the permit term would be about 61% of average annual costs in the final years of the permit term (**Table 9-4**). Many reserve management activities continue beyond the permit term but capital costs for construction services would be eliminated and management planning would be reduced. The costs for directed research, scientific review, and monitoring plans would be eliminated and on-going biological monitoring costs would be at about one-third the level attained by the end of the permit term. Staffing would be reduced from 10.5 FTE to 4.5 FTE beyond the permit term. Estimated annual costs in perpetuity are shown in **Table 9-4**. **Appendix G** describes the assumptions used to estimate these costs.

The funding mechanisms and responsibility for funding costs in perpetuity are discussed under Section 9.4.4 *Funding Adequacy* subheading *Funding for Post-Permit Management and Monitoring*.

## 9.4 Funding Sources and Assurances

Methods for assembling and equitably distributing the costs associated with the Habitat Plan have been the subject of extensive discussion and consideration by members of the public; officials from local, state, and federal agencies; and elected officials. The Habitat Plan, which incorporates the input from this diverse group, offers a balanced approach to conserving species and habitats while equitably distributing the costs.

The Habitat Plan establishes a framework for compliance with state and federal endangered species laws and regulations that accommodates future growth in the study area. Without the Habitat Plan, public and private entities whose activities would affect declining species and their habitats would be required to obtain permits and approvals from USFWS and CDFG before undertaking those activities to mitigate the impacts of their activities on the affected species. To comply with the NCCP Act and thereby obtain necessary permits under CESA, the Habitat Plan also provides for contribution to the recovery (“conservation”) of the covered species. Proponents of private and public development activities will benefit from this comprehensive approach in several ways: they will be assured of take coverage; they will avoid the time and expense of securing their own regulatory approvals; and they will have certainty and predictability with respect to their permit obligations. Consequently, the mitigation fees imposed to implement the Habitat Plan include some of the costs associated with the conservation activities. However, because a variety of groups will directly benefit from the Habitat Plan, those groups will also share in the responsibility for funding and otherwise implementing the Habitat Plan. This shared responsibility includes all of the costs associated with Plan implementation described in Section 9.3 *Cost Estimate Methodology*. Therefore, the term “mitigation” does not only refer to Federal mitigation requirements under the Habitat Plan. See Section 9.4.3 *State and Federal Funding* for more discussion regarding funding under the Section 6 program.

Plan funding will come from a number of different sources, which fall into one of several categories.

- **Habitat Plan Fees and Land Dedication.** This source includes private and public sector development impact fees and land dedications. Fees are also charged on specialized impacts such as wetlands (wetland fee) and temporary effects (temporary impact fee).
- **Local Funding.** Land in lieu of fees and non-fee local funding will complement fee-based funding sources. County Parks and some Participating Special Entities, including the Open Space Authority, will provide land (in fee or subject to conservation easements) in lieu of fees<sup>13</sup>. These lands that are contributed in lieu of fees count toward the mitigation component of the Plan. Non-fee local funding will take many forms,

---

<sup>13</sup> County Parks would be able to contribute land in lieu of fees as long as there is an assured funding source such as the Park Charter Fund. If the Park Charter is not renewed, this local funding source would not be available for land acquisition.

including continued and new investments in conservation actions and land acquisition by organizations such as County Parks, the Open Space Authority, SCVWD, and local land trusts that are consistent with the Plan. Additional funding is also expected from local foundations. These non-fee local funding sources (i.e., lands that are not contributed in lieu of fees) cannot be used for mitigation purposes and will be directed towards the NCCP portion of the Plan (i.e., contribution to recovery).

- **State and Federal Funding.** This source includes federal and state grant programs (e.g., USFWS grants under Section 6 of the ESA, Wildlife Conservation Board grants, and state bonds). Some of these funding sources are generally available throughout the state and nation, while others can only be used to implement an approved HCP or NCCP. State and federal funding can only be used for portions of the Plan that contribute to species recovery (not for mitigation), unless a state agency seeks permit coverage under the HCP as a Participating Special Entity (see Section 8.4 *Participating Special Entities*).
- **Interest Income.** The Implementing Entity is expected to gain limited income from interest on revenue not yet spent, plus more substantial revenue from interest on the endowment as it grows prior to its use to fund costs in perpetuity after the 50-year permit term.

**Table 9-5** summarizes the expected revenues and their sources over the permit term. Development fee funding will contribute to mitigation of impacts while non-fee funding from local, state, and federal sources will contribute to the conservation needs of the Plan (i.e., the contribution to species recovery). Each funding source is described below. Additional information on funding is provided in the *Santa Clara Valley Habitat Plan Develop Fee Nexus Study (Development Fee Nexus Study)* prepared by Willdan Financial Services and Urban Economics.

## 9.4.1 Habitat Plan Development Fees

This Plan utilizes a variety of private and public development-based fees to fund mitigation that will offset losses of land cover types, covered species habitat, and other biological values. These one-time fees pay for the full cost of mitigating project effects on the covered species and natural communities. Once paid, applicants do not need to find their own mitigation to satisfy state and federal endangered species laws. In addition, these fees should also satisfy all or most of the CEQA mitigation needs for biological resources, as discussed in Chapter 1.

Fees are based largely on the estimated permanent and temporary impacts to land cover types shown in **Tables 4-2 and 4-3**. Land cover impacts are used because land cover is the best predictor of potential species habitat and is applicable to all of the covered species (see Chapter 3, **Tables 3-5 and 3-6**, and the species accounts in **Appendix D**). Impacts to land cover are also used, in part, as the basis of the conservation strategy (see Chapter 5 for details). The following Habitat Plan development fees (development fees) are discussed below.

- Land Cover Fee.
- Endowment Fee Component.
- Plan Preparation Cost Recovery Fee Component.
- Nitrogen Deposition Fee.
- Serpentine Fee.
- Burrowing Owl Fee.
- Wetland Fee.
- Temporary Impact Fee.

This section also describes the process and timing for collecting fees and how fees are adjusted over time.

The following section describes the Habitat Plan development fees, the areas over which they are applied, and how they are calculated. The underlying analysis for the development fee calculations is provided in the *Development Fee Nexus Study*. The development fees used to fund the Plan are summarized in **Table 9-6**. This section also describes the process and timing for collecting fees and how fees are adjusted over time. The Implementing Entity will comply with all applicable provisions of the Mitigation Fee Act as to the deposit, accounting, expenditure and reporting of such fee revenues and any other applicable legal requirements. Exemptions to the fees are described in the following subsections.

## Projects or Activities Not Covered by the Plan

Projects or activities not covered by the Habitat Plan do not pay Habitat Plan development fees. See Chapter 2, Section 2.4 for a list of activities not covered by the Plan. In summary, these non-covered activities including the following:

- Existing development at the time of Plan adoption. These areas are considered developed for the purposes of this Plan and are not the focus of conservation actions for natural communities and covered species.
- Private sector activities that do not require a permit from a local jurisdiction as described in Chapter 2.
- Lot line adjustments (this is not covered by the Plan because it results in no impacts to covered species).
- Activities that are excluded from coverage because they do not meet the criteria in Chapter 2, Section 2.3.2, subheading *Private Development Coverage Areas*. These non-covered projects may opt into the Plan at the discretion of the local jurisdiction in consultation with the Implementing Entity.
- Projects for which a project proponent provides written confirmation to the Implementing Entity that the CDFG and USFWS have determined that the activity is not subject to CESA and ESA; or has already received the

necessary take authorizations under CESA and ESA; or has otherwise complied with CESA and ESA. An activity will be deemed to be in compliance with CESA and ESA by the Implementing Entity and thus be exempt from the conditions in Chapter 6 and otherwise comply with the Habitat Plan if the proponent provides the following:

1. Letters from both USFWS and CDFG that specifically refer to the activity and state that the activity is not likely to result in take of any federal or state listed species and will not preclude successful implementation of the conservation strategy for all covered species, or
2. A copy of an incidental take permit issued by CDFG for the activity, and copies of incidental take statements or incidental take permits issued by USFWS that authorize the incidental task associated with the proposed activity.

## Exemptions from Development Fees

All development that occurs on land mapped by the Habitat Plan as “urban-suburban”, “landfill”, “reservoir”, or “agriculture developed” land cover types (see Chapter 3 for land cover type descriptions) is exempt from development fees<sup>14</sup>, with the exception of the nitrogen deposition fee and burrowing owl fee, if it is not located in or adjacent to a parcel that contains a stream, riparian woodland or forest, wetland, pond, or serpentine. If new vehicle trips are generated, the nitrogen deposition fee described below may be assessed (**Table 9-7b**). These impacts are not tracked or reported by the Implementing Entity.

The category “reservoir” excludes dams, which are subject to Habitat Plan fees. Barns, corrals, ranch homes, and other small patches of existing development were not mapped as these four exempt land cover types because they fell below the 10-acre minimum mapping unit. These sites would also be exempt from the same development fees and not tracked or reported by the Implementing Entity as long as project proponents demonstrate that they were existing at the time of Plan adoption through air photos or other documentation.

Similarly, implementation of conservation actions described in Chapter 5 (or otherwise consistent with the Plan’s conservation strategy) in or outside the Reserve System are not charged development fees. They will however be tracked as impacts by the Implementing Entity and reported as supporting the conservation strategy. Most of the adverse effects associated with the implementation of conservation actions are considered temporary.

---

<sup>14</sup> Some lands inside the planning limit of urban growth have already been approved for development by local land use agencies. These sites are subject to the Habitat Plan development fee if land use approval is still required. However, as described in Chapter 4, these lands were not included in the impact analysis. Similarly, for the purposes of the revenue estimates, Habitat Plan fees were not assumed to be collected on these sites.

The following covered activities are also exempt from Habitat Plan development fees but are tracked as impacts, count towards the Stay-Ahead requirement, and are reported by the Implementing Entity:

- Urban development covered activities (see Section 2.3.2 *Urban Development* in Chapter 2) in Zones A, B, or C (see Zone definitions below) on parcels less than 0.5 acre as long as the parcel does not contain or is not adjacent to a stream, riparian woodland or forest, wetland, pond, or serpentine.
- Additions to existing structures or new structures that are within 50 feet of an existing structure (e.g., a new garage) that result in less than 5,000 square feet of impervious surface as long as no stream, riparian, wetland, pond, or serpentine land cover types are affected. Expansion is measured based on the existing structure's footprint at the time of Plan commencement. Subsequent additions must be added to the original amount to determine whether this threshold has been crossed.
- Construction of recreational facilities within the Reserve System<sup>15</sup>.

All of these activities exempt from the development fees are still covered by the permits. These exemptions from development fees overlap with the exemptions from conditions on covered activities described in Section 6.2 *Exemptions from Conditions*. Differences arise in some cases where fees will be paid but the covered activity does not have to conduct any or all surveys (see **Table 6-1**).

A verified land cover map (see Section 6.8.2 *Item 2: Project Description and Map*) and the Fee Zone map (described below) included in the final Habitat Plan will be used to determine which areas are not subject to the land cover fee. If a project proponent or a Permittee wishes to contest the mapped extent of the exempt land cover types on a parcel or project site, the Permittee (or the Implementing Entity in the event that a Permittee contests the mapping) may consider evidence provided by the project proponent documenting the land cover type on the site prior to Plan adoption. Evidence provided by project proponents is subject to review by the local jurisdiction and the Implementing Entity in accordance with the mapping methods described in Chapter 3. Any deviations from the Habitat Plan land cover map and associated fees must be approved by the local jurisdiction and the Implementing Entity.

## Determination of Development Fees

New development will pay a share of the costs of implementing the Habitat Plan consistent with mitigating the impacts of development activities.

The analysis takes into account that fees will vary to reflect the actual impact of a development project or public infrastructure project. This variation will be

---

<sup>15</sup> Instead of paying a fee for construction of infrastructure within the Reserve System, new disturbance for infrastructure does not count toward land cover type land acquisition requirements in Chapter 5, but it does count toward the total Reserve System size requirements.

applied through the use of development fee zones, as described below. The Habitat Plan development fees were established to meet the following criteria.

- Fees will assist in meeting both ESA and NCCP Act requirements.
- Fees generate sufficient funding to offset a proportionate share of Habitat Plan costs.
- Fees are consistent with the general level of biological impact associated with projects in different areas.
- Fees compare favorably with the actual or expected future cost of ESA and CESA permitting on a project-by-project basis, including the costs of uncertainty and project delays.

## Land Cover Fee

The primary component of the Habitat Plan development fees is a *land cover fee*. This fee is based on the mitigation of new development's impacts on land cover types at the project site (see below for calculation methods). The basis for the land cover fee is that the primary impact to the covered species is through the direct and indirect loss or degradation of their habitat (see Chapter 4 and **Appendix D** for details on effects to each covered species). Because habitat for covered species is so closely tied to land cover types (see Chapter 3 and **Appendix D** for details), the primary component of the development fee is associated with impacts to land cover types.

Public and private covered activities are subject to the land cover fee for permanent impacts on any land cover type besides urban-suburban, landfill, reservoir, or agriculture developed (a fee for temporary impacts is described below in this section).

Land cover fees tied to the project footprint are designed to address the direct loss and degradation of covered species habitat and natural communities. This fee will vary by geographic location in the permit area, as defined by three fee zones, to account for broad geographic differences in habitat impacts.

## Land Cover Fee Zones

As described in Chapter 4, impacts on covered species and natural communities vary according to whether projects occur within existing urban development, in cultivated agricultural areas (mostly in the Santa Clara Valley floor), or in natural land cover types. To account for these differences in impact, the land cover fee will vary based on project location.

Unlike the other development fees, the land cover fee varies by location. Three *Fee Zones* are defined by a map that determines the land cover fee paid by development (**Figure 9-1**). The Fee Zone map was developed based on the land

cover mapping in the Plan. These three zones correspond to the dominant land cover types, conservation value, and open space value within each Fee Zone.

- **Zone A: Ranchland and Natural Lands<sup>16</sup>.** Land within Zone A is strongly dominated by natural land cover types including grassland, oak woodland, and chaparral (**Figure 9-2**). Land uses in Zone A are mostly ranchland, low-density rural development, or public open space. Zone A occurs mostly outside of the Santa Clara Valley floor within the Diablo Range and the Santa Cruz Mountains and adjacent foothills. Development in this zone is expected to have, on average, greater effects on more covered species and natural communities than in other zones.
- **Zone B: Mostly Agricultural and Valley Floor Rural Residential Lands.** Zone B is strongly dominated by agricultural land cover types such as grain, row-crop, hay and irrigated pasture, disked/short term fallowed, orchards, and vineyards (**Figure 9-2**). Zone B also includes much of the rural residential land cover in the study area. Zone B occurs in the Santa Clara Valley exclusive of areas mapped by the Habitat Plan as having urban land cover types. Small adjacent valleys such as the Almaden Valley also contain small areas of Zone B. In general, covered activities that occur in this area have an effect on covered species and natural communities, but to a lesser extent than in Zone A.
- **Zone C: Small Vacant Sites.** Zone C includes specific sites that meet all of the following criteria:
  - ❑ Undeveloped sites (all land covers except urban-suburban, landfill, reservoir or agriculture developed).
  - ❑ 0.5 to 10.0 acres in size (parcels less than 0.5 acres are exempt from the land cover fee).
  - ❑ Surrounded on four sides by one or more of the following land cover types: urban-suburban, landfill, or agriculture developed.
  - ❑ Has no stream, pond, wetland, riparian, or serpentine land cover type within the site.

Sites must meet these four criteria in order to be eligible for the Zone C fee. Similar sites that do not meet all of the four criteria above pay the Zone A or Zone B land cover fee. Development of these areas will result in loss of open space and some habitat values, but impacts will be less than those in Zone B and substantially less than those in Zone A because these areas are already surrounded by development.

**Table 9-7a** lists the land cover fee by Fee Zone. The land cover fee includes components for recovering the costs of preparing the Habitat Plan and for developing an endowment fund for post-permit management and monitoring costs, in addition to Habitat Plan costs during the permit term. The Plan preparation and endowment fees are described in more detail below.

---

<sup>16</sup> Fee zone names are provided only as a general guide to the dominant land cover. The fee amount will be determined solely by a parcel's location within a Fee Zone mapped on **Figure 9-1** and the verified land covers present on the site.

Parcels that span more than one Fee Zone will pay fees according to number of project acres in each zone. Prior to implementation, the Implementing Entity will provide each Permittee with detailed Fee Zone and land cover maps to allow local agency staff to process and evaluate applications for Habitat Plan coverage or evaluate their own projects under the Plan. Habitat Plan fees will be adjusted over time to account for inflation (or deflation) according to the methods described below under *Adjustment of Mitigation Fees*.

If a project is located in an area mapped as Zone A or B, the project applicant may provide sufficient information (as required in Section 6.8.3 *Item 3: Land Cover Types on Site*) for the local jurisdiction to determine that a Zone C fee is warranted, or if no land cover fee is required. The Implementing Entity may periodically update the Fee Zones (**Figure 9-1**) as necessary (e.g., when fee adjustments may occur).

### Calculation Method of Land Cover Fees

The land cover fees applied in Zones A, B, and C (**Table 9-7a**) were developed to address the Plan's protection, restoration, creation, management, and monitoring costs in the Habitat Plan. The mitigation costs are divided by the projected acres of land impacts to determine the mitigation cost per acre. In the calculation of the acreage of land impacts, impacts in Zone B and C are weighted lower, relative to impacts in Zone A, reflecting the lower average habitat value of land in Zones B and C. The land cover fees for Zones B and C are based on the estimated per-acre effects of development on covered species for each zone, relative to Zone A. Per acre impacts in Zone B are weighted at 69% of impacts in Zone A. Per acre Zone C impacts are weighted at 25% of Zone A impacts.

As described below, mitigation costs per acre of impact to serpentine land cover types are higher than the mitigation cost per acre of impact to other land covers. Therefore, the additional costs of impacts to serpentine land covers are included in the nitrogen deposition and serpentine fees, and are not included in the land cover fees. The land cover fees were determined through the following steps:

1. The share of the reserve acreage that is required to mitigate development impacts was determined by applying a preservation ratio to the number of acres of each land cover type projected to be impacted by development, resulting in the acreage required for mitigation for each land cover type. Preservation ratios vary from 4.0 acres preserved for every impacted acre for the most sensitive land covers, such as serpentine land cover types, to 1.0 or less for land cover types with lower habitat value, such as ruderal or disturbed areas. The preservation ratios are consistent with previously accepted mitigation ratios for projects analyzed on a project-by-project basis outside the Habitat Plan. The share of total Plan costs (**Table 9-1**) associated with the land cover fee exclude costs associated with impacts on wetlands and burrowing owl habitat because these costs are funded by separate fees (see relevant subsections, below). The remaining amount of total Plan costs were allocated between Plan activities associated with serpentine versus non-serpentine land cover types to enable calculation of separate fees for impacts based on these two categories of land cover types.

2. After deducting for costs associated with nitrogen deposition (funded separately by the nitrogen deposition fee) and revenue from the temporary impact fee, the share of total Habitat Plan costs related to development mitigation on non-serpentine land cover types were divided by the total projected impacted acres on land cover types in Zone A, B, and C, weighted by fee zone, to determine the mitigation cost per impacted acre, at the most significant level of impact. This cost per acre is the Zone A land cover fee. The Zone B and C land cover fees are set based on the Zone A land cover fee, using the weighting factors for each zone.
3. Weighting factors for the Zone B and C fees were derived based on the relative habitat and landscape linkage values to the covered species within each zone, the proportional contribution of covered activities within each zone to direct and indirect impacts (including watershed-level effects such as impervious surfaces), and the relative cost of conservation actions within each zone.

## How to Calculate the Land Cover Fee

The land cover fee is calculated differently depending on whether a covered activity is located inside or outside of the urban service area. Each situation is described in the following sections.

### Inside the Urban Service Area

Within the urban service area, land cover fees on private and public projects will be assessed on the development area (see **Figure 6-1**) except for land designated with a land use of Urban Development or Rural Residential (see **Figure 2-2**) on a parcel that is less than 10 acres in which case, the land cover fee is assessed on the entire parcel. The fee will not be paid on any land set aside for the Reserve System (i.e., conservation easement) or for stream setback that is avoided. Fees assessed based on the parcel will be assessed on the entire parcel regardless of how much land disturbance is proposed at the time of the permit application to the local jurisdiction (i.e., regardless of the project footprint). One exception to this is linear public projects (e.g., in stream and utility corridors), which will be assessed the land cover fee based on the project footprint<sup>17</sup>. In these cases, the project footprint for the purposes of assessing the land cover fee is defined as the area where ground disturbance is conducted or vegetation removal occurs. Another exception is that contiguous areas (irrespective of parcel boundaries or ownership) that are 10 acres and larger (for serpentine land cover, 3 acres and larger) and protected by an easement that precludes development are not required to pay Habitat Plan fees. These lands would not necessarily be incorporated into the Reserve System.

---

<sup>17</sup> As described above, conservation actions will not be charged development fees, including within stream corridors because they support Plan implementation.

Charging the land cover fee on the entire parcel is justified because little or no habitat value for covered species is expected to remain within the urban service area once all covered urban development occurs, with the exception of creek corridors or areas where only a portion of a large parcel is developed, due to habitat removal, disturbance, and fragmentation and severe indirect and adverse effects (see Chapter 4 for more details on the mechanisms and magnitude of these effects). If subsequent covered activities are proposed on the same parcel, the land cover fee is not charged again (a separate wetland fee may be charged if the second project directly affects a stream, wetland, or riparian area and the wetland fee was not paid previously; see below).

## Outside the Urban Service Area

Outside the urban service area, the land cover fee will be assessed on private and public projects based on the development area, as defined in Chapter 6, Section 6.4.4, subheading *Condition 7 Rural Development Design and Construction Requirements* (also see **Figure 6-1** for an illustration). The development area is roughly equivalent to the project footprint but includes a 50-foot buffer around permanently disturbed areas and a 10-foot buffer around temporarily disturbed areas. If a subsequent project is proposed on the same parcel, permanent impact fees will only be paid on areas for which permanent impact fees were not previously paid. Land cover fees are paid on the entire development area, even if certain areas are avoided within the development area.

## Stream Setbacks

Lands in the stream setbacks required by Condition 11 *Stream and Riparian Setbacks* in Chapter 6 that are avoided (i.e., not directly impacted by the project) are not subject to the land cover fee. If the development is granted an exception or exemption to the stream setback (see Chapter 6, Section 6.4.6, subheading *Condition 11 Stream and Riparian Setbacks*), the project proponent will be charged the applicable Habitat Plan development fees over the entire development area including the affected setback (the unaffected setback is not charged the development fee).

## Endowment Fee Component

As described under *Costs in Perpetuity*, above, the Reserve System will require management and monitoring after the permit term. To guarantee funding for these post-permit costs, an *endowment fee component* will be charged as part of each fee (land cover, nitrogen deposition, serpentine, burrowing owl, wetland mitigation, and temporary impact fees), will be charged and gradually accumulated during the permit term. By the end of the permit term the endowment will be large enough to generate revenue from investment returns that will cover all estimated post-permit costs.

The Habitat Plan cost model estimated that costs for post-permit Reserve System management and monitoring will be approximately \$2.9 million annually, in 2010 dollars (see Section 9.3.7 *Costs in Perpetuity*). An endowment fund model was constructed to estimate the revenue needed during the permit term to support this need at the end of the permit term.

Based on the endowment model, an endowment fund of approximately \$90 million in 2010 dollars would be needed at the end of the permit term to generate average real returns (i.e., inflation-adjusted) of \$2.87 million annually (plus \$60,000 annually for areas with wetland mitigation). This revenue would be sufficient to fund post-permit term Reserve System management and monitoring, including accounting for inflation after the permit term.

Annual returns on endowment fund balances were assumed to equal 3.25%. This key assumption was based on a current habitat endowment management program operated by the National Fish and Wildlife Foundation (NFWF) under agreement with the California Department of Fish and Game. The 3.25% annual real rate of return is net of NFWF administrative fees. This assumption was corroborated by the County of Santa Clara Finance Agency based on their fund management experience.

The endowment fee will be collected from public and private development fee payers over the 50-year permit term. Assuming fee revenue to the endowment fund accrues evenly over the permit term, annual endowment revenues of \$720,000 (plus \$10,000 for areas with wetland mitigation) would be needed to, with interest, build a \$90 million balance in the endowment fund at the end of the permit term. Over 50 years, endowment fee revenue of \$37 million would be needed. This is equal to approximately 11.7% of projected revenue from the development fees (12.2% for areas with wetland mitigation). Therefore, the endowment fee component is set at 11.7% or 12.2% of each development fee, (with the higher rate applied to the wetland fee). **Table 9-8** shows the calculation of the endowment fee component.

The endowment fee component may be adjusted based on the change in the CPI from the U.S. Bureau of Labor Statistics for the San Francisco–Oakland–San José Metropolitan Area, as described under *Automatic Adjustment of Fees*, below. An evaluation of the fund balance in the endowment fund and the fund's investment performance will be conducted every 5 years as part of the fee assessments described under *Periodic Assessment and Adjustment of Fees*, below. This evaluation will assess the adequacy of the current endowment fund balance and projected future endowment fee revenue for funding perpetual management costs. Based on this evaluation, the endowment fee component may be increased or decreased so that the projected balance of the endowment at the end of the permit term will be sufficient to fund reserve management and monitoring costs in perpetuity.

## Plan Preparation Cost Recovery Fee Component

All of the Plan's development fees include a component to partially reimburse the Local Partners over time for the costs incurred to develop the Habitat Plan between 2005 and 2011. The *plan preparation cost recovery fee component* (also called the plan preparation fee component) includes only the Plan preparation costs funded by the Local Partners. This fee does not include the costs funded by the Section 6 Planning Grants from CDFG.

Only the Plan preparation costs related to mitigation of the impact of covered activities were included in the plan preparation fee. We estimated that the cost of preparing a regional conservation plan that only meets the mitigation requirements (i.e., only includes actions to mitigate covered activities) would have been 80% of the preparation cost of the Habitat Plan.

**Table 9-9** shows the calculation of the Plan preparation cost recovery fee component. As shown, the Plan preparation costs allocated to mitigation of covered activities were estimated at \$4.2 million, or 1.4% of projected development fee revenue. Therefore, the Plan preparation cost recovery fee is set at 1.4% of each of the Plan's development fees. The Local Partners will not pay the Plan preparation cost recovery fee component for their covered activities. Instead the Local Partners will be reimbursed for the fair share of plan preparation costs associated with private development and special participating entities that did not contribute funding for preparation of the Plan.

## Nitrogen Deposition Fee

The *nitrogen deposition fee* addresses indirect impacts of covered activities and is based on the Habitat Plan costs related to mitigating the impacts of airborne nitrogen deposition. As described in Chapter 4, serpentine grassland and serpentine covered species in the study area are particularly sensitive to deposition of airborne nitrogen compounds generated by air pollution resulting from vehicles and other sources. These nitrogen compounds enter ecosystems as nitrogen fertilizer. This increased soil fertility favors nonnative annual grasses over native plant species found in serpentine soils. One native serpentine plant species, the dwarf plantain, is the host plant for the Bay checkerspot butterfly, a key covered species in the Habitat Plan. Serpentine plants covered by the Habitat Plan that will be adversely affected by on-going nitrogen deposition include Metcalf Canyon jewelflower, most beautiful jewelflower, smooth lessingia, Tiburon paintbrush, and fragrant fritillary.

It is expected that serpentine lands in the Reserve System will have higher average per-acre costs for reserve management and monitoring than the average costs for non-serpentine land covers. These higher costs result from the number of covered species occurring in serpentine land cover types<sup>18</sup> and the costs of

<sup>18</sup> At least seven covered wildlife species (**Table 3-5**) and eight covered plants (**Table 3-6**) occupy one or more serpentine land cover types for all or part of their life-history.

managing serpentine reserve lands to prevent the intrusion of nonnative species as a result of nitrogen deposition and other threats. The nitrogen deposition fee includes the management and monitoring costs for serpentine lands acquired as mitigation, over and above the average management and monitoring costs that would be required for the same number of non-serpentine acres.

In addition to serpentine grassland, 13 other land cover types in the Reserve System have been identified as sensitive or potentially sensitive to nitrogen deposition (California Energy Commission 2006). As with serpentine land cover types, the adverse effects of nitrogen deposition are expected to increase management costs in these land cover types in order to mitigate these effects (e.g., increased invasive species control). For land cover types known to be sensitive to nitrogen deposition<sup>19</sup>, 20% of the estimated mitigation costs are assumed to be related to nitrogen deposition effects. For land cover types that may be sensitive to nitrogen deposition<sup>20</sup>, 10% of the estimated mitigation costs are assumed to be related to nitrogen deposition effects. Both estimates are considered conservative and account for the uncertainty on specific effects. Again, base mitigation costs were estimated using typical mitigation ratios for each land cover type.

Air pollution simulation modeling was conducted to estimate the percentage of nitrogen deposition in the habitat areas that results from air pollution emissions within the Habitat Plan study area, as opposed to air pollution that is transported from other regions to the study area (see summary in Chapter 4 and the technical report in **Appendix E**). The modeling estimated that 46% of nitrogen deposition on habitat areas comes from existing development and vehicle traffic generated locally within the study area. The study area share of nitrogen deposition on habitat areas is estimated to increase to 49% in 2035 and 51% by the end of the permit term in 2060. Based on this analysis, 50% of the Habitat Plan costs related to mitigating nitrogen deposition impacts are allocated to development in the study area through the nitrogen deposition fee.

**Table 9-7b** lists the nitrogen deposition fee, which is applied to all Fee Zones in the same way. The nitrogen deposition fee will be assessed as a fee per new daily vehicle trip over existing conditions. **Table 9-10** shows the derivation of the nitrogen deposition fee. The Local Partners may substitute an alternative revenue source for the fees that would otherwise apply to new vehicle trips.

While nitrogen emissions come from a variety of sources that include vehicles, it is not feasible at this time to charge a fee on major non-vehicle sources of nitrogen (e.g., point sources such as power plants and industry). As shown in **Table 9-10**, the cost of management and monitoring for serpentine mitigation acres over and above management and monitoring costs for an equivalent number of non-serpentine acres is approximately \$5.3 million. The non-serpentine mitigation costs related to nitrogen deposition are approximately

<sup>19</sup> Land cover types known to be sensitive to nitrogen deposition are northern mixed chaparral, northern coastal scrub, mixed oak woodland, foothill pine-oak woodland, mixed evergreen forest, and redwood forest.

<sup>20</sup> Land cover types that may be sensitive to nitrogen deposition are California annual grassland, valley oak woodland, blue oak woodland, coast live oak forest and woodland, freshwater marsh, seasonal wetland, and pond.

\$14.9 million. Because approximately 50% of nitrogen deposition on these habitats results from nitrogen emissions in the study area, 50% of the costs related to nitrogen deposition are allocated to the study area and are included in the nitrogen deposition fee.

## Serpentine Fee

Plan actions required to mitigate impacts to serpentine land cover types are substantially more costly than mitigation actions for impacts to other land cover types. To reflect the higher mitigation costs, an additional serpentine fee will be assessed on direct impacts to serpentine land cover types: serpentine bunchgrass grassland, serpentine outcrops and barrens, serpentine seep, and mixed serpentine chaparral. This fee is in addition to the land cover fee described above.

Mitigation for serpentine impacts is particularly costly because per-acre land acquisition, management, and monitoring costs are higher for serpentine than for other land covers. In addition, the preservation ratio for serpentine is higher than for other land cover types in the study area.

Per-acre costs for serpentine mitigation lands are expected to be higher than the average cost for other reserve lands because it is expected that serpentine lands will primarily be acquired through acquisition of parcels in the 50 to 250 acre size range. Overall, the majority of land acquired for the Reserve System is expected to be parcels over 250 acres, and it is expected that the per-acre acquisition cost of these larger parcels will be less than the costs of 50- to 250-acre parcels (see **Appendix G** for details).

Mitigation costs per acre of impact are also higher for serpentine land cover types than for other land cover types because higher preservation ratios are typically required for impacts to serpentine than for impacts to other land covers. The preservation ratio to mitigate serpentine impacts is assumed to be 4.0 acres preserved for each acre of impacts, compared to mitigation ratios of 0.5 to 3.0 for other land cover types in the study area.

The serpentine fee was calculated using the same method described above in the *Calculation Method of Land Cover Fees* subsection. The only difference is that in step 2 of the method described in that subsection, serpentine costs and acres of impacts on serpentine land cover types are used to calculate costs per acre of impact, instead of non-serpentine costs and acreage. As described in that step, additional costs related to nitrogen deposition on serpentine land cover types are deducted before making this calculation because these costs are allocated to the nitrogen deposition fee (described above). As described under *Nitrogen Deposition Fee*, above, serpentine lands also have higher management and monitoring costs than other land cover types in the Reserve System.

The serpentine fee will be imposed based on the acreage of impacts to serpentine land cover types as mapped in the field (see Section 6.8.3 *Item 3: Land Cover Types on Site*). In the fee schedule (**Table 9-6**) the serpentine fee is calculated as the additional cost over and above the land cover fee so the serpentine fee is imposed in addition to the land cover fee. The serpentine fee is also imposed in

addition to the nitrogen deposition fee that would apply to the project because the cost of nitrogen deposition impacts are accounted for separately in the nitrogen deposition fee. The serpentine fee will be adjusted over time to account for inflation (or deflation) according to the methods described below under *Adjustment of Mitigation Fees*.

## Burrowing Owl Fee

If a covered activity occurs in occupied burrowing owl nesting habitat as defined in **Figure 5-11**, a *burrowing owl fee* will be paid by the project applicant. This fee will be in addition to the land cover fee. The burrowing owl fee is charged on the area on which land cover fees are levied. A portion of the fee may be waived if a portion of the site is set aside in a conservation easement or management agreement with the Implementing Entity to manage the site for burrowing owl habitat consistent with the Habitat Plan. In these cases, the burrowing owl fee will not be charged on the portion of the site subject to the easement or management agreement.

The burrowing owl fee was determined by the cost to implement conservation actions specifically designed for the western burrowing owl (see Chapter 5, Section 5.4.6 *Western Burrowing Owl* subheading *Burrowing Owl Conservation Priorities*) and the estimated impacts to occupied nesting habitat (see Chapter 4, Section 4.6.4 *Western Burrowing Owl*). These costs are itemized in **Appendix G**. The fee of \$50,438 per acre was calculated by dividing the costs of the conservation actions, plus remedial and contingency funding needed for the burrowing owl conservation strategy, by the expected impacts to occupied nesting habitat (198 acres), plus endowment and Plan preparation costs  $((\$8,570,000 + \$260,000)/198) + \$5,218 + \$624$  (**Table 9-6**).

The burrowing owl fee will be adjusted over time to account for inflation (or deflation) according to the methods described below under *Adjustment of Mitigation Fees*. The burrowing owl fee will be imposed on impacts to occupied nesting habitat based on the most recent modeled habitat map maintained by the Implementing Entity.

## Example Development Fee Calculations

**Example 1 (urban project 1):** A project is located in an area mapped by the Habitat Plan as “urban-suburban” (i.e., existing developed area). The project site does not contain, and is not adjacent to, streams, riparian areas, wetlands, ponds, or serpentine. The site is also not in burrowing owl nesting habitat. Because the project is located on an exempt land cover type, it does not pay the land cover fee. The nitrogen deposition fee is calculated by multiplying the estimated new vehicle trips (i.e., daily trips generated above the pre-project condition) by the per-vehicle-trip nitrogen deposition fee in **Table 9-7b**.

**Example 2 (urban project 2):** A landowner of a 1.2-acre parcel in Gilroy wants to build a new single-family home on most, but not all, of the parcel. The parcel is within Zone B (**Figure 9-1**). The land cover fee is calculated by multiplying the total parcel size, 1.2 acres, by the Zone B per-acre fee in **Table 9-7a**. Because the project is new, it will generate new vehicle trips. The nitrogen deposition fee is calculated by multiplying the estimated new daily vehicle trips by the per-vehicle-trip nitrogen deposition fee in **Table 9-7b**. The two fees are added to arrive at the total Habitat Plan fee for the project, as long as wetlands are avoided (see below). Additional Habitat Plan fees may be assessed as a result of temporary impacts (e.g., leach field construction) and/or impacts to streams and wetlands, as described below.

**Example 3 (rural project):** A landowner of a 40-acre parcel proposes to build a single-family home on 1.5 acres of this parcel. The parcel is located entirely within Fee Zone A (**Figure 9-1**). The base development fee is calculated by multiplying the base fee in Zone A (**Table 9-7a**) times the development area of the project. The development area will be slightly larger than the 1.5-acre project footprint because of the buffer added to the project footprint that accounts for indirect impacts (**Figure 6-1**). Because the project is new, it will generate new vehicle trips. The nitrogen deposition fee is calculated by multiplying the estimated new daily vehicle trips by the per-vehicle-trip nitrogen deposition fee in **Table 9-7b**. The two fees are added to arrive at the Habitat Plan development fee for the project. Additional Habitat Plan fees may be assessed as a result of temporary impacts (e.g., leach field construction) and/or impacts to streams and wetlands, as described below.

## Wetland Fee

Permittees or private project proponents are required to map all wetlands, ponds, streams, and riparian woodland as part of their Habitat Plan Application Package (see Chapter 6, Section 6.8.4 *Item 4: Map of Wetlands, Ponds, Streams, and Riparian Woodlands*). Permittees or private project proponents that impact wetlands, ponds, streams or riparian woodland/scrub will be required to pay an additional *wetland fee* on top of the other development fees. **Table 9-11** lists the applicable fees on wetland, riparian, and stream land cover types. See below for how to calculate these fees.

The wetland fee is intended to pay the full cost of restoration or creation of these land cover types, including design, implementation, post-construction monitoring, and remediation through the permit term.

As described in Chapter 5, mitigation requirements for wetland, stream, pond, and riparian woodland/scrub impacts include both preservation and restoration/creation. The wetland fee will cover the cost of wetland, stream, and riparian restoration or creation, but not wetland, stream, or riparian preservation. The cost of preservation of these land cover types is included in the land cover fee because land prices will not be significantly affected by the presence of these land cover types, and most restoration/creation will occur on land already owned by the Implementing Entity. Therefore, for every acre of impact on wetlands,

streams, ponds, and riparian woodland/scrub, applicants will pay the appropriate land cover fee (according to fee zone) towards land acquisition and the conservation program as a whole, as well as a wetland fee to cover the costs of successful restoration or creation. Wetland fees vary by wetland type to account for the different costs of restoration and the different mitigation ratios required (**Table 9-11**). **Table 9-11** also lists the accepted methods for determining the area to which the wetland fee applies. See the *Development Fee Nexus Study* for the calculation of wetland fees by wetland type. A wetland map completed by a qualified biologist (see Chapter 6, Section 6.8.4 *Item 4: Map of Wetlands, Ponds, Streams, and Riparian Woodlands*) will assist the local jurisdictions and the Implementing Entity in determining appropriate wetland fees.

## Calculating Fees for Wetland and Pond Impacts

The fees for impacts to coastal and valley freshwater marsh, seasonal wetland, and ponds is calculated by multiplying the applicable wetland fee (**Table 9-11**) by the acres of impact to the wetland or pond. As described in Chapter 6, Section 6.5, subheading *Condition 12 Wetland and Pond Avoidance and Minimization*, covered activities that do not completely avoid indirect effects to wetlands will be considered permanently impacted. The area of indirect effects, as determined by the local jurisdiction or Implementing Entity, will be added to the area of direct effect when calculating fees for wetland and pond impacts. Exceptions to this are described further in Condition 12. If a wetland or pond occurs in a stream, only one of the fees is paid in that section of the stream (i.e., the fee on stream impacts is not additive to the fee on impacts to in-stream wetlands or ponds). The Implementing Entity will determine which fee is to be paid when wetlands or ponds occur in streams. (Typically the higher of the two fees would be paid.)

## Calculating Fees for Stream and Riparian Woodland Impacts

The fee on impacts to streams is calculated by applying the linear distance of stream impact, as measured along the stream centerline, to the stream fee per linear foot (**Table 9-11**). Impacts that occur within the ordinary high water mark of a stream channel will be counted as a stream impact. Impacts that occur on one side of the stream channel will be assessed the fee in the same way as impacts that occur on both sides of the stream channel. As described above, if the stream supports a wetland, only one fee will be paid, as determined by the Implementing Entity.

The fee for impacts to riparian woodland and sycamore alluvial woodland are calculated based on the acres of direct impacts to woodland or scrub vegetation as measured by the outer limit (the side away from the stream) of the tree or shrub canopy (drip line). Impacts to riparian woodland or sycamore alluvial woodland that also affect the stream channel will pay both fees (i.e., the fee on riparian impacts is additive to the fee on stream impacts).

## Aquatic Restoration or Creation Provided in Lieu of Wetland Fee

Unlike other development fees, wetland fees cannot be waived in lieu of land dedication (see *Land Provided in Lieu of Development Fees* below for details). However, project proponents have the option of restoring, managing, and monitoring their own wetland, stream, or riparian mitigation site in lieu of paying all or part of the wetland fee. Project proponents may propose to the Implementing Entity to create, manage, and monitor their own pond mitigation site in lieu of paying all or part of the wetland fee. In both cases, construction of restoration and creation of aquatic features will be initiated prior to or concurrent with construction of the covered activity, the mitigation will be consistent with the requirements of Chapter 5, the site will be protected by a conservation easement<sup>21</sup>, and management and monitoring will be funded in perpetuity. Applicants may propose paying the Implementing Entity to manage and monitor the site after construction is completed. Construction of all aquatic restoration and creation projects must comply with the Stay-Ahead provision of this Plan and must be completed by Year 40, consistent with the requirement for the Implementing Entity to do the same (see Chapter 5).

The Implementing Entity must approve requests to perform aquatic restoration or creation in lieu of paying the wetland fee. The Implementing Entity will evaluate proposals to perform restoration and/or creation in lieu of wetland fees based, in part, on the history of the applicant performing successful wetland restoration elsewhere and whether the restoration or creation project is consistent with the conservation strategy and requirements of the Plan. Restored and created aquatic features must also meet the reserve design and assembly criteria in Chapter 5. In order for the Implementing Entity to approve aquatic restoration or creation in lieu of fees, the local jurisdiction approving the project must secure a guarantee through conditions of approval that the restoration or creation will be implemented and remediated if success criteria are not met. In the case of a Permittee proposing the restoration or creation in lieu of wetland fees, the Permittee must sign an agreement with the Implementing Entity to provide this guarantee. After success criteria are met and the applicant assures funding, the Implementing Entity will assume all management and monitoring responsibility of the restoration or creation site as part of the Reserve System.

To satisfy Clean Water Act Section 401 and 404 requirements, aquatic restoration and creation may also need to be approved by the Corps and Regional Board and meet the success criteria agreed upon by these agencies.

Alternatively, applicants may purchase appropriate wetland restoration or creation credits in a private mitigation bank in the permit area that has been approved separately by USFWS and CDFG and pre-approved to service the Habitat Plan. Currently there are no such banks in the study area, but they may

---

<sup>21</sup> As described in Chapter 5, Permittees may implement some stream and riparian restoration projects outside of the Reserve System (i.e., without a conservation easement).

be established. Guidelines for the use of mitigation banks are found in Chapter 8, Section 8.6.2, subheading *Private Mitigation Banks*.

## Temporary Impact Fee

As described in Chapter 2, there are many covered activities that are ongoing and that result in small, localized, temporary impacts on natural land cover types. As described in Chapter 4, the majority of these activities, particularly those within urban areas, will have little or no effect on covered species or their habitats. Some ongoing activities, however, are expected to have substantial temporary impacts on covered species due to their large footprint, location in natural land cover types, effect on local soils or hydrology, or a combination of these factors. Temporary impacts are defined in Chapter 4 as “direct impacts that alter land cover for less than one year and that allow the disturbed area to recover to pre-project or ecologically improved<sup>22</sup> conditions within 1 year (e.g., prescribed burning, construction staging areas) of completing construction.”

Specific temporary impacts are subject to the temporary impact fee (see list below of specific activities subject to this fee). Projects subject to the temporary impact fee will pay the fee in one of two ways.

- If the frequency of the impact over the permit term can be predicted, the applicant may pay the fee for infrequent treatments up front, to address all impacts during the permit term. This discounted fee is calculated as a fraction of the full land cover fee. The total fee will be calculated using the formula below.

$$\text{Temporary Impact Fee} = (\text{Land cover fee} \times \text{development area or project footprint in acres} \times (F + R)) / 50$$

where  $F$  = the number of calendar years in the permit term in which the activity occurs and  $R$  = the number of calendar years expected for the site to return to pre-project conditions (a maximum of 1 year). Temporary impacts are not subject to the nitrogen deposition fee.

The maximum time allowed for a site to return to pre-project conditions will be 1 year from the end of construction. The project proponent must document to the satisfaction of the Implementing Entity that the disturbance and site recovery occurred at or better than the predicted timeline.

OR

- The applicant may pay the full land cover fee (see **Figure 9-1** and **9-7a**) and retain the ability to disturb the area repeatedly during the permit term.

Temporary impacts that occur in the same location repeatedly during the permit term and that pay the full land cover fee will be counted and tracked as a permanent impact. Temporary impact fees paid on a site can be credited

---

<sup>22</sup> *Ecologically improved* means that the site functions ecologically better than the functions present on the site prior to ground disturbance.

towards any permanent impact fees that may be required on the same site in the future.

As described in Chapter 8, all or a portion of the temporary impact fee can be waived in exchange for land dedication or aquatic restoration or creation, based on the nature of the impact. The amount waived will be determined by the Implementing Entity on a case-by-case basis according to the rules and principles described in Chapter 8.

Temporary impacts that occur within wetland or serpentine land cover types will be assessed a temporary wetland or serpentine mitigation fee according to the formula shown above, but based on the applicable wetland or serpentine mitigation fee (see **Tables 9-6**). Temporary impacts that occur on occupied burrowing owl nesting habitat, as defined in **Figure 5-11**, will also pay a temporary impact fee according to the burrowing owl fee.

Applicants have the option of developing and implementing their own wetland restoration or pond creation project in lieu of the temporary wetland fee. If the applicant's restoration plan is approved by the Implementing Entity, then no temporary wetland impact fee is required. The Implementing Entity will verify that the applicant's wetland restoration and/or creation project is constructed according to specifications and that the project meets its success criteria.

## **Activities Not Subject to the Temporary Impact Fee**

To reduce administrative costs, temporary impact fees will not be assessed on any covered project with impacts of less than 0.25 acre except to wetlands, ponds, riparian woodland, streams, or serpentine.

All covered activities that result in temporary impacts are subject to the applicable conditions described in Chapter 6 and will be tracked against the Plan's impact limits. As described in Chapter 2, some agencies may already have endangered species permits for operations and maintenance activities and will therefore not be subject to the requirements of this Plan or the temporary impact fee (e.g., SCVWD for their Stream Maintenance Program).

The conservation actions described in Chapter 5 and the monitoring actions described in Chapter 7 will not be assessed a temporary impact fee. For example, wetland, stream, and riparian restoration projects conducted for the Habitat Plan may result in temporary impacts. Because these actions support the conservation strategy, they will not be assessed a temporary impact fee.

Mowing of previously maintained flood control channels will have minor impacts and is therefore subject to applicable conditions in Chapter 6 but not subject to the temporary impact fee because the impact analysis assumed these land cover types would be permanently affected during the permit term (these covered activities will pay the appropriate fee prior to impact). Similarly, mowing of existing road rights-of-way that are regularly mowed are subject to applicable conditions in Chapter 6 but not subject to the temporary impact fee.

Sediment removal in artificial off-channel detention basins or groundwater recharge ponds, when free of vegetation, are not subject to temporary impact fees.

### **Activities on Urban Development or Rural Residential Land Uses Inside the Planning Limit of Urban Growth**

Covered activities such as mowing, tree trimming, and other activities resulting in temporary impacts that occur in areas with a land use of urban development or rural residential within the planning limits of urban growth, but excluding San José's Coyote Valley Urban Reserve and South Almaden Valley Urban Reserve, Morgan Hill's Southeast Quadrant, or Gilroy's Hecker Pass, are subject to the conditions described in Chapter 6 but will not be charged a temporary impact fee because the impact analysis assumed these land uses would be permanently affected during the permit term (these covered activities will pay the appropriate fee prior to impact).

### **Activities Subject to the Temporary Impact Fee**

Temporary impacts of any size to wetlands, ponds, riparian woodland, streams, serpentine, or burrowing owl occupied nesting habitat will be charged the appropriate temporary fee regardless of location.

Maintenance of the vegetated portion of on-channel detention basins or vegetated groundwater recharge ponds is subject to the temporary impact fee because these areas are more likely to provide habitat for covered species.

### **Activities Outside the Planning Limits of Urban Growth with Little or No Soil Disturbance**

Covered activities with temporary effects outside the planning limits of urban growth that result in little or no soil disturbance and that are greater than 0.25 acre are more likely to affect covered species than the same covered activities within the planning limits of urban growth. The activities that will be assessed a temporary impact fee for the portion of the project outside the planning limits of urban growth of the participating jurisdictions include, but are not limited to, those listed below.

- Road or trail maintenance along vegetated shoulders where natural land cover types are disturbed or removed.
- Maintenance of public facilities including buildings, utilities, and stormwater treatment where natural land cover types are disturbed or removed.
- SCVWD maintenance activities outside streams, canals, and other facilities (vegetation clearing on dam faces will pay the full land cover fee because it is considered a permanent impact).
- Septic leach fields.

- Vegetation clearing needed for utility line or gas line maintenance (e.g., mowing, disking, herbicide spraying, tree trimming<sup>23</sup>).
- Weed abatement undertaken by Permittees.

Sediment removal in artificial off-channel detention basins or groundwater recharge ponds, when free of vegetation, are not subject to temporary impact fees in the same way as on-channel detention basins or groundwater recharge ponds, as described above. Similarly, vegetation removal conducted by a Permittee to establish a fuel break on private property (e.g., as an enforcement action) is not subject to temporary impact fees.

### **Activities Outside the Planning Limits of Urban Growth with Soil Disturbance**

The following covered activities larger than 0.25 acre include those projects where the area of impact on covered species is larger than the project footprint (e.g., effects on wildlife movement or connectivity). Such activities outside the planning limits of urban growth of the participating jurisdictions include, but are not limited to, those public or private projects listed below<sup>24</sup>.

- Pipeline installation, repair, or replacement (trenching).
- Underground electrical transmission line installation, repair, or replacement.
- Underground telecommunication line installation, repair, or replacement.

The Implementing Entity, in consultation with the project proponent and the Wildlife Agencies, will determine an appropriate project impact area subject to the temporary impact fee. These types of activities may have both temporary and permanent effects (i.e., trenching through a wetland complex that permanently alters site hydrology would be considered a permanent effect). In these cases, the temporary impact fee along with other fees described in this chapter could be assessed. Coverage under the Habitat Plan will also be subject to the approval of the Implementing Entity. As an alternative to devoting time and resources to defining a project impact area, project proponents may choose, in consultation with the Implementing Entity, to pay the full land cover fee on the project footprint in lieu of paying temporary impact fees multiple times during the permit term.

## **Collection of Mitigation Fees**

All fees paid by private applicants to participating jurisdictions will be collected by the applicable jurisdiction. Fees paid to participating local jurisdictions will be transferred to the Implementing Entity on a regular basis, but at a minimum,

<sup>23</sup> Tree removal outside the urban service areas of the participating jurisdictions will be treated as an activity with soil disturbance.

<sup>24</sup> The Permittees do not have jurisdiction over some of the activities in this list. However, these projects could be covered by the Plan through the *Participating Special Entities* process described in Section 8.4.

annually. The transfer schedule and process will be determined by the Implementing Entity early in Plan implementation.

All fees paid by public agencies (i.e., the Permittees) will be paid directly to the Implementing Entity according to a process and schedule developed by the Implementing Entity. See *Timing of Mitigation Fee Payment* below.

## Adjustment of Mitigation Fees

The dynamic nature of the costs associated with HCP and NCCP implementation, including land acquisition costs and operating, maintenance, and management costs, requires a flexible approach to funding through time. Many existing HCPs have not incorporated sufficient flexibility into their funding mechanisms and, as a result, have found that funding lags behind increasing costs, compromising Plan implementation. This Plan includes two mechanisms for adjusting fee levels: automatic adjustments and periodic assessments. Both adjustments will be performed by the Implementing Entity and provided to all participating local agencies.

### Automatic Adjustment of Fees

The two primary costs of the Plan, land acquisition and operations/maintenance, will likely change at different rates over time. Land costs in many areas of California, including the San Francisco Bay Area, have historically increased well above the rate of inflation. The significant demand for housing in the Bay Area and the more limited housing supply have often increased housing prices significantly, in turn increasing the value of developable land. Other Plan costs, including the cost of personnel, supplies, and equipment involved in managing, operating, restoring, and maintaining the Reserve System, will more closely follow the general rate of inflation. To account for these differing rates of inflation, the Implementing Entity will update the development fees automatically on an annual basis by a date determined by the Implementing Entity's Governing Board within the first 6 months of Plan implementation according to the indices and procedures described in **Table 9-12**.

The variation in the cost of land due to site-specific factors means that it is difficult to develop land cost indices; consequently, no such indices are available. However, given the link between the housing market, housing prices, and land costs, housing prices generally provide a more accurate index for land cost inflation than measures of general inflation, especially for land whose value is primarily generated by its development value. The index to be used to adjust the land acquisition cost portion of fees is the annual House Price Index (HPI) from the Federal Housing Finance Agency for the San José–Sunnyvale–Santa Clara, CA Metropolitan Statistical Area for the prior calendar year. The index to be used to adjust the non-land cost portion of fees is the CPI from the U.S. Bureau of Labor Statistics for the San Francisco–Oakland–San José Metropolitan Area. The Implementing Entity may decide to use other indices during Plan

implementation if other indices are developed that better predict the costs of the Plan.

Annual automatic adjustments in development fees will either increase or decrease the total fee per acre. Fees are more likely to go up than down each year. Since 1915 the CPI for this Metropolitan Statistical Area has gone up in 81 of 92 years (88% of the time). Since 1977, the HPI has gone up in this Metropolitan Area in 24 of 30 years (80% of the time).

## Periodic Assessment and Adjustment of Fees

To ensure that the fees generated by development and other covered activities are adequately covering their share of Plan costs, two types of fee reviews will be performed on a regular basis. At least every 2 years, the Implementing Entity staff will analyze the fee amounts and compare them to actual and projected costs. The Implementing Entity staff will then report to the Implementation Board on whether the automatic fee adjustments are keeping pace with actual costs to provide an opportunity to adjust fees different than the automatic adjustments.

In addition, every 5 years a fee assessment will be completed to review the costs and their underlying assumptions that were developed as part of the original funding plan. The review could include comparing appropriate land sales in the study area transacted after the start of the Habitat Plan with the original land cost assumptions (see **Appendix G**). The actual costs of operating, maintaining, and managing the Reserve System can also be compared to the original estimates of these costs to determine the actual change in non-land costs. Automatic annual fee increases will resume after the periodic fee assessment and will continue until the next periodic assessment.

Fees may go up or down depending on the results of the assessment.

## Timing of Mitigation Fee Payment

For private projects, mitigation fees are required to be paid before or at the time the grading permit for the project is issued. If a grading permit is not required, fees must be paid before or at the time the first construction permit is issued<sup>25</sup>.

For public projects, mitigation fees must be paid to the Implementing Entity prior to implementing the covered activity. For public projects conducted by outside contractors, the timing of fee payment may coincide with the award of the construction contract because this represents the time at which the public agency commits to implementing the project.

---

<sup>25</sup> A grading permit is typically the first permit issued that results in ground-disturbing activity. In cases where there is no grading permit, the fees will be due upon issuance of the first construction permit (e.g., building permit).

## Land Provided in Lieu of Development Fees

If a landowner or Permittee conveys a portion of the development site (either in fee simple or a conservation easement) to be included in the Habitat Plan Reserve System and the Implementing Entity and the Wildlife Agencies approve the inclusion, the portion of the property included in the Reserve System would not be assessed the land cover, serpentine, burrowing owl, and/or land cover temporary impact fees<sup>26</sup>, as appropriate. Landowners may also provide land separate from development sites for the Reserve System, if approved by the Implementing Entity and the Wildlife Agencies.

In both cases (land provided on or off the covered activity site), landowners or Permittees that convey land to the Implementing Entity may receive credit for the dollar value of these acquisitions against select development fees that might be owed by the landowner or Permittee due to impacts of their covered activities. Land to be conveyed by a landowner or Permittee will be eligible for development fee credit if the land satisfies the criteria described in Chapter 8, Section 8.6.7 *Land Dedication In Lieu of Development Fee*.

### Criteria for Determining Fee Credit for Land Provided in Lieu of Development Fees

The value of the conveyance of land to the Implementing Entity and any credit against development fees will be determined by the Implementing Entity on a case-by-case basis. Any land provided in lieu of development fees must contribute toward the implementation objectives and requirements of the Habitat Plan. In quantifying the credit to be awarded, the Implementing Entity will consider all of the following:

- the extent to which the land would contribute toward the implementation objectives and requirements of the Habitat Plan,
- the fair market value of the land based on an appraisal,
- actual land transactions costs, and
- actual costs of biological survey work performed to provide baseline data for the Habitat Plan, if applicable.

The Implementing Entity will award any credits against development fees from land conveyed after the conveyance has been completed.

---

<sup>26</sup> For sites within the urban service area where the entire parcel is charged the development fees, this means that the portion of the parcel dedicated to the Reserve System would have fees waived in that portion. The acquisition and transactional value of the portion dedicated to the Reserve System also provides a fee credit to the portion of the parcel paying the development fees. Covered activities outside the urban service area only pay a fee based on the development area, so portions of a parcel dedicated to the Reserve System would only provide a fee credit to the fees that apply in the development area.

Fee waivers and credits in exchange for land conveyed will only be allowed when the Implementing Entity determines that acceptance of land in lieu of funds is consistent with the conservation strategy. For example, one of the factors that the Implementing Entity will consider is whether it has sufficient funds available or funding commitments to manage and monitor the conveyed land during the permit term. (See the end of this chapter for a discussion of funding for post-permit management and monitoring.) Funding to ensure management and monitoring of the land conveyed will be provided by the project proponent. Any funds provided by the landowner or Permittee in excess of the amount required to ensure management and monitoring will be credited against any development fees otherwise due. Land cannot be dedicated in lieu of wetland fees and the nitrogen deposition fee.

## Implementing Conservation Actions in Lieu of Development Fees

As described above, at the discretion of the Implementing Entity, landowners and Permittees have the ability to provide land in lieu of all or a portion of select development fees or wetland restoration or creation in lieu of all or a portion of their wetland fees. Permittees with special expertise may also provide other forms of conservation besides land acquisition in lieu of all or a portion of all development fees otherwise owed by them. At the discretion of the Implementing Entity, conservation actions performed or undertaken by Permittees will be eligible to offset development fees if the Permittee satisfies all of the following criteria:

- the conservation action is consistent with the conservation strategy (Chapter 5) or the monitoring and adaptive management program (Chapter 7);
- the conservation action contributes to the biological goals and objectives, the implementation objectives, and would fulfill Plan requirements;
- the conservation action will be completed prior to the date on which development fees are owed; and
- the award of a development fee credit will not hinder the Implementing Entity's ability to satisfy its Stay-Ahead requirement.

For example, a Permittee may conduct portions of the monitoring program that occur in streams under their jurisdiction. In another example, Permittees may provide land management or administrative services to the Implementing Entity, both of which could offset all or a portion of development fees. Conservation actions performed for the Three Creeks HCP to benefit fish covered in that plan may also benefit the covered species in the Habitat Plan and therefore could be credited under both plans.

The monetary value of the credit will be determined by the Implementing Entity on a case-by-case basis. The timing of fee credit will also be determined by the Implementing Entity on a case-by-case basis. In most cases, conservation actions

would need to be performed prior to the covered activity occurring and fee credit being applied (e.g., all aquatic restoration and creation actions would have to occur prior to the construction of the covered activity in order to receive credit toward development fees).

Conservation actions on non-wetland land cover types may be used only to offset land cover fees, not wetland fees. Restoration or creation actions for wetland land cover types can be used only to offset wetland fees, as described below under subheading *Aquatic Restoration or Creation Provided in Lieu of Wetland Fee*.

Permittees that intend to undertake multiple conservation actions may present a package of conservation actions to the Implementing Entity for their approval of credit collectively. Credit provided by conservation actions conducted by a Permittee well in advance of the covered activities may be used by the Permittee to offset fees required for future covered activities.

In quantifying the credit to be awarded for single conservation actions or multiple conservation actions, the Implementing Entity should consider the following:

- the conservation value of the action with respect to Plan implementation requirements, as described based on a standard economic valuation approach related to the Plan fee structure;
- whether the project is located on a site with high resource or restoration values, or has unique or high biological values that support its inclusion in the conservation strategy; and
- whether maintenance and monitoring costs have been identified and are incorporated into cost of the project or otherwise provided according to the requirements of the Plan.

Credits accrued by a Permittee do not have any value beyond covering development fees incurred during Plan implementation. If a Permittee has credits remaining at the conclusion of the permit term, no payment or “refund” will be made to the Permittee. Selling or trading credits between Permittees is not allowed because the funding strategy of the Plan relies on certain contributions of the Permittees beyond their mitigation requirements (see Section 9.4.2 *Local Funding*).

## Fee Exempt Projects and Participating Special Entities

Some private projects exempt from the Habitat Plan fees and Habitat Plan ordinance may wish to pay Plan fees or comply with other Plan conditions to facilitate compliance with environmental laws other than the ESA, CESA, or NCCP Act. For example, urban development on a parcel that is less than 0.5 acre that would not affect streams, riparian, wetlands, ponds, or serpentine would be exempt from the Habitat Plan fees. If this parcel supports a small amount of other natural land cover, the project proponents may wish to pay Habitat Plan fees and apply applicable conditions on covered activities in Chapter 6 through their local development approval process to enhance their project for other

purposes (e.g., CEQA)<sup>27</sup>. Fee payment however, does not define a project applicant's need for incidental take coverage under the Plan. In some cases, projects with minor impacts may not be required to pay Habitat Plan development fees. These project proponents would still be required to submit an application package, as defined in Chapter 6 so that quantifiable impacts can be tracked by the Local jurisdiction and Implementing Entity.

For activities performed by a Participating Special Entity (see Section 8.4 *Participating Special Entities*), the Participating Special Entity will pay, at a minimum, the same fees as the Permittees (i.e., applicable development fees) to receive take authorization. The Implementing Entity may require additional fees to cover direct and indirect costs of extending permit coverage under the Habitat Plan, including the costs of Implementing Entity staff time to assist with permit coverage, a portion of the costs of the initial preparation of the Plan, and a portion of the costs of conservation actions designed to contribute to species recovery.

## 9.4.2 Local Funding

Substantial funds for Plan implementation will come from local sources other than Habitat Plan fees (**Table 9-5**). As described in Chapter 8, land acquisitions and other conservation actions conducted by local organizations can be counted towards the Habitat Plan as long as those conservation actions meet the terms of the Plan. Land acquisition and other conservation actions conducted prior to impacts of the Permittees can be counted towards fee requirements, as described above.

The following local agencies are expected to provide funding that will support the Plan. These local funding sources require that they be used to contribute to the recovery of the covered species (i.e., the NCCP portion of the Plan) or used to mitigate the impacts of their own agency.

Other funding sources may be identified and used during Plan implementation. For example, there may be future ballot measures which could include a funding component for specific elements of Habitat Plan implementation. However, the Local Partners are not expected to, nor are they required to, utilize local general funds for Habitat Plan implementation. Funding shortfalls, and the options available if they occur, are discussed below in Section 9.4.4 *Funding Adequacy*.

## County of Santa Clara Parks and Recreation Department

The County of Santa Clara Parks and Recreation Department has been acquiring lands consistently since its founding in 1956. County Parks has a dedicated source of local funding that is used for land acquisition and a majority of their

---

<sup>27</sup> For the funding analysis, no funding was assumed from exempt projects that choose to opt in to the Habitat Plan.

operations and maintenance budget. The Park Charter Fund was approved by voters in 1972 and has been reauthorized six times since, most recently in 2006, by large margins<sup>28</sup>. Currently, the Fund must be reauthorized by the voters every 12 years; the current fund is authorized through 2021. The Fund is generated by an assessment on property throughout Santa Clara County at 1.425 cents per \$100 of assessed value. A minimum of 15% of the Park Charter Fund is earmarked for land acquisition. The County Parks Strategic Plan in 2003 estimated 10-year revenues for land acquisition at over \$67 million (County of Santa Clara 2003). As a source of funding, the Park Charter Fund has restrictions for the use of its funds where funds can only be used for "...the acquisition, development or acquisition and development of real property for county park purposes and for the maintenance and operation of county parks." The intended use of the Park Charter Fund for the goals of the Habitat Plan would need to be consistent with County park purposes for public access and recreation<sup>29</sup>. In addition to the provision of park and recreation purposes, the Park Charter funds can be used to contribute to the recovery of the covered species and/or to mitigate for the impacts of County projects. The funds cannot be used to mitigate private development or the covered activities of non-County Permittees.

County Parks is estimated to acquire 5,950 acres of new land that will directly support the Habitat Plan. Actual acquisitions that support the Plan may exceed this estimation. Any acquisitions conducted by County Parks would be owned by the County. All other species and habitat-related management and monitoring would be paid for by the Implementing Entity. The value of 5,950 acres of land acquisition by County Parks is \$45,980,000 over the life of the Plan (**Table 9-5**). This value was calculated using an average per acre land value of \$7,727, which includes land costs, transaction costs, due diligence, and pre-acquisition surveys (based on total land acquisition costs of \$278,940,000 [**Table 9-1**] and 36,100 total acquired acres for the Reserve System). Of the total amount of approximately 5,950 acres, approximately 1,100 acres are interim conservation lands (**Table 5-5**).

The County Parks Strategic Plan estimated spending on land acquisition at approximately \$5.6 million per year in 2007 dollars (County of Santa Clara 2003), or \$80 million to \$120 million over the 10-year horizon of the Strategic Plan. The \$46.0 million estimate for the Habitat Plan thus represents a conservative portion of the projected expenditures on land acquisition for the agency as a whole over 50 years.

The value of County Parks land contributions to the Habitat Plan could be used to offset any fees that the County would owe to the Habitat Plan for projects undertaken by the County. County Parks' acquisitions would also be used to contribute to the recovery of the covered species; they cannot mitigate the impacts of non-County projects. Wetland fees will not be offset by land acquisition, and in such cases the respective proponents of County projects would have to cover these wetland fees. Development fees that would be owed by the County excluding wetland fees are estimated at \$ 26.7 million (\$23.7 million by

<sup>28</sup> For example, in 1996, the Park Charter Fund was reauthorized by 80.2% of the votes in the affirmative.

<sup>29</sup> See Article VI, Section 604 of the Santa Clara County Code.

County Parks and \$3.0 million by County Roads and Airports), all of which would be offset by the contribution of land to the Plan by County Parks.

## **Land Acquisition by Other Local Land Agencies, Non-Profits, and Foundations**

To complete the Reserve System, an estimated 10,000 acres must be acquired in addition to the land acquisition expected from County Parks, state and federal funding (described below), and land acquisition funded by development fees. The additional 10,000 acres is also needed from local sources to provide adequate local funding matches for the state and federal grants expected for the Plan. The cost of the additional 10,000 acres is estimated at \$77.3 million (**Table 9-5**) based on the same per acre cost used to calculate the estimated value of County Parks land acquisition explained in the prior subsection. The funding for this land acquisition is expected to come from a variety of local land acquisition agencies, non-profit organizations that are dedicated to land acquisition for open space purposes, and local foundations active in this field. Each of these potential sources is described below.

### **Santa Clara County Open Space Authority**

The Open Space Authority currently owns over 15,300 acres of open space in Santa Clara County, approximately 80% in fee title ownership. This agency has been acquiring land since 1995, although most purchases began in 1999.

The Open Space Authority is supported by an assessment district based on property tax assessments in Santa Clara County, San José, Milpitas, Santa Clara, Campbell, and Morgan Hill. The City of Gilroy is not part of the Open Space Authority. To date, the Open Space Authority has spent over \$50 million on land acquisition (not in current year dollars) from their benefit assessment district, grants, and gifts.

The purpose of the Open Space Authority is “to preserve key portions of the natural environment in order to balance continuing urban growth.” This purpose is consistent with the purposes of the Habitat Plan. The boundary of the Open Space Authority coincides almost exactly with that of the Habitat Plan study area. Because of this geographic alignment and a consistent agency purpose with the Habitat Plan, a majority of future acquisition by the Open Space Authority are expected to be suitable for the Habitat Plan Reserve System.

On September 9, 2010, the Open Space Authority Board of Directors adopted a set of principles of participation in the Habitat Plan. These principles will serve as a basis for a more formal agreement between the Open Space Authority and the Implementing Entity. The principles of participation include commitments to help the Implementing Entity implement the Plan by partnering with them on land acquisition and land management. The Open Space Authority Board has also stated their intent to acquire an estimated 5,000 acres for inclusion in the

Reserve System using their own funds and an additional 2,500 acres for the Reserve System if feasible (e.g., leveraging their own funds with those of others).

The Open Space Authority has also stated their intent to enroll an estimated 1,000 acres of their existing lands into the Reserve System that meets the reserve design requirements and principles of the Plan and to enable enhancement actions funded by the Implementing Entity that will benefit the covered species. If Open Space Authority lands could not be enrolled in the Reserve System because conservation easements are precluded<sup>30</sup> and these lands meet all other criteria for Type 1 or Type 2 open space under the Habitat Plan, then the lands could also count towards the 1,000 acres.

In summary, the Open Space Authority intends to incorporate 5,000 acres of interim lands or lands acquired after permits are issued into the Reserve System and may incorporate an additional 2,500; an estimated 7,500 acres of the 10,000 acres (75%) needed from other local funding sources. In addition, the Open Space Authority intends to enroll up to 1,000 acres of existing lands.

The Open Space Authority also acknowledges their likely role as an agent for land management for Reserve System lands on behalf of the Implementing Entity. The Open Space Authority could serve as a land manager on land that it owns within the Reserve System or on land owned by others within the Reserve System.

## **The Nature Conservancy**

As described in Chapter 2, The Nature Conservancy (TNC) is working to preserve land in and adjacent to the study area through its Mount Hamilton Project, which seeks to protect the most ecologically critical 500,000 acres of this landscape. To date, The Nature Conservancy has permanently protected roughly 110,000 acres in the Mount Hamilton Range through acquisition of conservation easements or fee title to ranches east of U.S. 101. Land acquired in fee title has been transferred to land management agencies such as Henry W. Coe State Park, the CDFG, and the Open Space Authority.

Throughout the planning process, TNC has been an active supporter of the Habitat Plan. They have participated in the Stakeholder Group and provided technical support to the conservation strategy. As a result, many of the conservation goals of the Plan are not only consistent with the conservation goals of the Mount Hamilton Project but with TNC's conservation protocols more broadly. TNC is expected to continue to support the Plan in implementation as a potential land acquisition partner to the Implementing Entity. Where conservation goals overlap, TNC may be able to provide matching funds beyond those identified in this chapter to leverage funds provided by the Implementing Entity. In some instances, TNC may be able to act more quickly to secure land

---

<sup>30</sup> Interest in land “dedicated for open space purposes” by the Open Space Authority Board cannot be transferred without a vote of the people. This may prohibit conservation easements, which are transfers in land interest.

deals than one of the local public agencies or the Implementing Entity. In these instances, they may act as a land acquisition agent for the Implementing Entity by temporarily holding land until the land can be transferred to a local land management agency like County Parks or the Open Space Authority and added to the Reserve System. In addition, TNC may provide technical assistance to the Implementing Entity during implementation. Although no funding from TNC is identified, TNC would very likely continue to acquire land in the study area, and some of that land is expected to be suitable for the Habitat Plan Reserve System.

## **Peninsula Open Space Trust**

The Peninsula Open Space Trust (POST) is a non-profit land trust that has been actively protecting open space in the Santa Cruz Mountains for over 30 years, including within this Habitat Plan study area. POST is among several strong non-profit conservation leaders in the area covered by the Habitat Plan. Although no funding from POST is identified, POST would likely continue to acquire land in the study area, and some of that land is expected to be suitable for the Habitat Plan Reserve System.

## **Local Foundations**

Local foundations that support open space acquisition and biodiversity planning are expected to play an important role in supporting the Habitat Plan. Foundations such as the Gordon and Betty Moore Foundation (Moore Foundation) and the David and Lucile Packard Foundation (Packard Foundation), which are based in Santa Clara County, have a history of supporting land conservation in the Western United States and are supportive of regional conservation planning in general. The Moore Foundation in particular has expressed support for this Plan acknowledging that the Plan's broad and comprehensive conservation strategy for the region will benefit a wide range of conservation programs and could possibly serve as a model program for others in California. Foundations are expected to continue providing funds beyond those identified in this chapter for land acquisitions within the study area<sup>31</sup>, and this Plan may be considered in their funding decision processes.

## **Interest Income**

A small source of income to the Implementing Entity will come from interest on fund balances generated by development fee revenues held prior to expenditure, with a larger amount coming from earnings on the endowment prior to the end of the permit term. The interest estimate for fee revenues held prior to expenditure assumes that the Plan's fund balances will earn an average interest rate of 3.0%. This is consistent with the assumption generally used by the County of Santa

---

<sup>31</sup> As an example, in 2009 and 2010 the Gordon and Betty Moore Foundation provided two grants totaling \$2.38 million to the East Contra Costa County Habitat Conservancy to fund land acquisition for their HCP/NCCP.

Clara Finance Agency when projecting future interest income. Future interest rates are uncertain; however, this assumption is reasonable. The average return rate on the state's Local Agency Investment Fund (LAIF), a statewide investment pool for local agencies, over the 10-year period through fiscal year 2009–2010 was 3.2%, similar to the performance on the County's commingled investment pool.

The Implementing Entity's monetary income from fees is estimated to be approximately \$363.7 million over the 50-year permit period (**Table 9-5**), or an average of \$7.3 million per year. Local government finance experts indicate that local agencies often hold operating reserve balances equal to approximately 20% of their annual revenue. Thus, it is estimated that the Implementing Entity's average fund balances from fees will be 20% of its annual fee income. (The Plan assumes no interest generated from grant funds due to the typical requirement to spend the land acquisition grants immediately.) Using this assumption, interest income from the Plan's non-grant revenue is estimated to be \$2.2 million over the 50-year permit period (**Table 9-5**).

### 9.4.3 State and Federal Funding

The U.S. Congress and the California Legislature have determined that conserving species and their natural habitats is an issue of both national and state importance. The federal and state governments will strive to assist local governments and property owners to assemble, manage, and monitor the Habitat Plan Reserve System. This assistance will contribute to the land acquisition requirements of the Plan, contribute to recovery of listed species in the study area, and reduce or avoid the need to list additional species as threatened or endangered.

Through this Habitat Plan and the Implementing Agreement with the Permittees, the federal and state governments will endeavor to contribute 14,900 acres of land to the Reserve System that will be administered, managed, and monitored by the Implementing Entity<sup>32</sup>. To be conservative, the Plan assumes that the Implementing Entity will incur the costs of administering, managing, and monitoring these lands. Funding for this land acquisition could come from a variety of sources, including those administered by CDFG and USFWS (**Table 9-13**). Land contributions by USFWS and CDFG could be provided through contributions by the Wildlife Conservation Board. An assessment of progress toward this goal will be made annually and included in the annual report of the Implementing Entity submitted to CDFG and USFWS.

State and federal funding sources other than those administered by CDFG and USFWS (and other than the Wildlife Conservation Board) are also expected to

<sup>32</sup> 14,900 acres = \$115 million / \$7,727 per acre average land acquisition cost, rounded to the nearest hundred acres. Although this acreage contribution represents 41% of the new land acquired for the Reserve System, this overstates the percentage of the overall effort attributable to State and Federal contribution to the Plan from these funding sources because of Plan costs in addition to land acquisition, e.g., management and monitoring costs.

play an important role in implementing the Habitat Plan. For example, many of the funding sources described in **Table 9-13**, especially sources administered by the California Coastal Conservancy and the California Department of Parks and Recreation, have provided substantial revenues in the past for habitat conservation in the Habitat Plan study area.

If, after the exercise of all available authority and utilization of all available resources, the CDFG and USFWS are unable to contribute 14,900 acres to the Habitat Plan Reserve System, the Implementing Entity, the Permittees, CDFG, and USFWS will reevaluate the Plan and work together to develop a mutually acceptable solution.

Implementation of the Habitat Plan is subject to the federal Anti-Deficiency Act and the availability of appropriated funds. Nothing in this Plan will require the obligation, appropriation, or expenditure of any money from the United States Treasury. USFWS will not be required to expend any federal agency's appropriated funds until an authorized official of that agency commits these funds in writing. Similarly, CDFG will not be required to expend any state agency's appropriated funds until an authorized official of that agency commits these funds in writing. The state and federal agencies will use their best effort to contribute the acreage identified above.

## Measuring State and Federal Contributions

State and federal contributions to the Plan are earmarked only for the portion of the Plan that contributes to the recovery of covered species. State and federal contributions cannot be used for the mitigation component of the Plan.

Estimated contributions by the state or federal government must be measured in terms of acreage rather than dollars. To address this, Plan funding source assumptions from **Table 9-5** were converted to acreage based on the overall average cost per acre of reserve land. This calculation assumes that the state and federal agencies will not be acquiring and managing the land themselves (e.g., in a new State Ecological Reserve or National Wildlife Refuge).

The contribution of state and federal funds, which is tracked by acres of land acquired, assumes that the Implementing Entity will administer, manage, and monitor the land itself and pay all of those costs. If the state or federal agency acquires and manages the land, the contribution in acres from the state or federal agency will be adjusted to account for this additional financial contribution. If all costs to restore, enhance, manage, and monitor the land are assumed by the state or federal agency, the \$115 million contribution would be the equivalent of 6,424 fully-managed acres<sup>33</sup>. If the state or federal agency assumes some but not all responsibility for management and monitoring then the land acquisition

---

<sup>33</sup> \$115 million / \$611 million \* 34,153 acres = 6,424 acres. The denominator = \$657 million total cost including endowment fund balance at end of permit term, minus the \$3 million of plan preparation costs and the \$43 million to manage County Parks lands incorporated into the Reserve System.

contribution will be accounted for by mutual agreement between the Wildlife Agencies and the Implementing Entity. As with other partners, all land acquired by state or federal agencies must be managed in accordance with the standards of the Habitat Plan.

If the state and/or federal governments contribute a portion of the costs of a land acquisition, the state and/or federal contribution will be measured as a share of the overall acquired acreage that is in proportion to the state and federal share of the overall costs of the acquisition.

## State and Federal Funding Sources

### Federal Endangered Species Act Section 6 Program

USFWS's Cooperative Endangered Species Conservation Fund authorized under Section 6 of the ESA<sup>34</sup> is likely to provide a significant source of grant funding for the Habitat Plan. USFWS annually provides significant funds to local jurisdictions developing regional HCPs. The Section 6 grant program is divided into three funding categories: HCP Assistance (for planning), HCP Land Acquisition, and Recovery Land Acquisition Grants. Grants are applied for and administered by CDFG. The Habitat Plan has already received four grants from the HCP Assistance program totaling \$1.3 million. During implementation, the Plan will be eligible for HCP Land Acquisition grants.

Since 2002, USFWS has made available, on average, \$52.5 million in land acquisition funds nationally. Of this, an average of approximately 44%—nearly \$23 million—was dedicated annually for land acquisition for HCPs in California<sup>35</sup>. Since 2002, California has received over \$160 million in land acquisition funding for approved HCPs and NCCPs, by far the largest share of any state.

### State Funding Sources

As described in **Table 9-13**, there are a variety of sources available for state funding, including existing California propositions (e.g., Proposition 84). Proposition funding for the Habitat Plan can come from a variety of sources including the Wildlife Conservation Board, CalFed Bay-Delta Program, and California Department of Parks and Recreation. More state bond measures for open space preservation and management are expected to be issued as California propositions during the 50-year term of the Plan. For example, Proposition 84 was passed by California voters in the November 2006 General Election by a margin of 53.7%. This bond provides funding for water, park, and natural projects, including \$90 million for certain NCCPs, and \$108 million for the San

<sup>34</sup> The Fund is commonly referred to as the “Section 6” grant program.

<sup>35</sup> Funding levels to California have held steady for at least eight years. Annual funding to California reached a peak in FY 2007, when 67% of all HCP land acquisition funding went to the state.

Francisco Bay Conservancy Program. Additional bonds similar to Proposition 84 and with approved NCCPs, including the Santa Clara Valley Habitat Plan, are expected to be put forward to the voters several times during the 50-year permit term.

## Mitigation and Conservation Components

As discussed in Chapter 1, NCCPs are required to conserve species and their habitats. To achieve this standard, this conservation strategy exceeds typical project mitigation requirements. Although the Plan provides a single conservation strategy to mitigate impacts and conserve covered species, it is important to roughly delineate the mitigation obligations of the Plan from the conservation components because USFWS and CDFG can only fund land acquisition that contributes to the conservation component of the Plan (i.e., they cannot subsidize mitigation).

As described above, development fees were determined, in part, on the basis of mitigation requirements without the Habitat Plan. Preservation ratios were estimated for all terrestrial land cover types based on previously accepted mitigation ratios proposed on a project-by-project basis to offset impacts to occupied habitat for the covered species. Based on these ratios, the overall mitigation component of the Plan is estimated at approximately 56% of the land acquisition (i.e., 56% of the 36,100 acres of new land acquired = 20,216 acres that are administered, managed, and monitored).

This analysis is provided only for convenience to help delineate eligibility for state and federal grant funding for the conservation portion of the Plan. The calculation above cannot be applied as a project mitigation ratio because it was calculated based on the substantial economies of scale available in this Plan (e.g., preserving large blocks of land that support many covered species).

The Habitat Plan is a single plan that must be implemented as a whole. Permits will be issued on the basis of implementation of the entire Plan. The development fees will cover the responsibilities and requirements of the Implementing Entity and participating local jurisdictions to both mitigate their impacts and conserve in the study area. State and federal contributions; continuing local, state, and federal conservation efforts; and funding from private competitive grants can contribute to the conservation component of the Plan.

### 9.4.4 Funding Adequacy

As shown in **Table 9-5**, funding sources will meet all expected costs of the Habitat Plan. The funding sources described in this chapter have been estimated conservatively. That is, actual funding from local, state, and federal sources may exceed these projections. For example, County Parks may acquire more land than is predicted that would contribute to the Reserve System. Alternatively, additional revenue may be secured from fees on Participating Special Entities.

Temporary impact fees may also exceed projections if many applicants choose to pay all applicable development fees in full rather than try to estimate the frequency of their activities during the permit. Despite these conservative assumptions and additional revenue sources, revenue may fall short of costs. This section further discusses the adequacy of Plan funding.

## **Additional Funds Needed for Management or Monitoring**

The contingency fund is primarily intended to offset land management or monitoring costs that are higher than predicted by this Plan on a short-term basis. If this fund is inadequate to offset these costs, or if costs are predicted to exceed revenue on a long-term basis, then the Implementing Entity will consider whether to adjust management and monitoring requirements without jeopardizing meeting Habitat Plan requirements, or to raise revenue to offset the funding shortfall. When feasible, the Implementing Entity will make reasonable adjustments to revenue to meet the obligations of the Habitat Plan. Some changes may require a minor or major amendment to the Habitat Plan. See Chapter 10 for rules regarding changes to the Habitat Plan.

## **Actions Required Should Land Acquisitions not Keep Pace with Impacts**

The NCCP Act requires that conservation keep pace with development in “rough proportionality.” The Stay-Ahead provision of the Plan (see Chapter 8) is intended to ensure that land acquisition and enhancement, restoration, and creation stay within 10% deviation of impacts<sup>36</sup>. Meeting this requirement, however, depends on the steady acquisition of land from willing sellers.

The nature of land acquisition is such that assembly of the Reserve System is not likely to be accomplished in a constant or predictable fashion. It is expected that large (500 acres or more) land acquisitions will comprise the bulk of the total acreage of the Reserve System. Acquisition of large parcels (or combinations of parcels) is typically more complex and may take longer to realize than acquisition of small parcels. Therefore, additions to the Reserve System are expected to be episodic. As a result, the Implementing Entity may be behind in land acquisition relative to impacts for short periods of time while large land acquisition deals are being processed. Over the long term, larger land acquisitions will save money because of their typically lower price per acre and lower per acre land transactions costs.

The Implementing Entity will be responsible for performing the conservation actions necessary to comply with the Stay-Ahead provision, as described in

---

<sup>36</sup> The 10% deviation allowance does not apply to covered plants. Plant conservation measures will always precede impacts, with the exception of the Coyote ceanothus (Section 5.4.11).

Chapter 8. If the Implementing Entity determines it is at risk of non-compliance with the Stay-Ahead provision for land acquisition (e.g., greater than 10% deviation from the requirements without reasonable land acquisitions in the pipeline), the Implementing Entity may notify the other Permittees that it is necessary to temporarily require project proponents to provide land instead of paying a fee, unless the Permittee has previously accrued sufficient credits to offset any fee otherwise due. If the Stay-Ahead provision is not satisfied for land acquisition for any land cover type based on the criteria in Section 8.6.1 *Stay-Ahead Provision* of Chapter 8, the Implementing Entity must notify the other Permittees that it is necessary to temporarily require project proponents to provide land instead of paying a fee unless the Wildlife Agencies agree, after conferring with the Implementing Entity, that a different plan of action devised with the Implementing Entity will remedy the situation and it is not necessary to require project proponents to provide land instead of paying a fee. If the Implementing Entity determines that it is at risk of non-compliance with the Stay-Ahead provision for other components of the conservation strategy besides land acquisition (e.g., habitat restoration), the Implementing Entity will confer with the Wildlife Agencies immediately to determine the best course of action.

If the Implementing Entity initiated the requirement due to its own determination that the Plan was at risk of non-compliance, the requirement to provide land instead of a fee will be lifted (i.e., it will revert back to an option) as soon as the Implementing Entity determines that it is no longer at risk of non-compliance with the Stay-Ahead provision. If the requirement is imposed by the Wildlife Agencies as a result of non-compliance with the Stay-Ahead provision, the requirement will be lifted as soon as the Implementing Entity demonstrates in writing to the reasonable satisfaction of the Wildlife Agencies that the Plan is in compliance with the Stay-Ahead provision.

## **Actions Required Should Development Fee Funding Fall Short of Expectations**

This chapter describes the funding expected from development fees from the implementation of covered activities by public agencies (the Permittees) and private developers. These estimates are based on long-term projections of development based on historic patterns and the approval planning documents of local jurisdictions. The pace of development has slowed considerably in the study area as a result of the 2008–2009 economic recession. As a result, the pace of development is not expected to reach pre-2008 levels for many years. Revenue from covered activities during the first 5 to 10 years of implementation may fall short of expectations.

Revenue from non-fee funding sources could offset the shortfall in fee funding in the short term, providing enough funding for land acquisition early in the Plan. However, most non-fee funding cannot be used for land management, monitoring, or administrative costs associated with the Reserve System. These costs are dependent on fee funding. In the short term, if fee funding cannot keep pace with the operations and management needs of the Reserve System, the

Implementing Entity will consider the following options in consultation with the Wildlife Agencies:

- Continued acquisition of land from willing sellers for the Reserve System to take advantage of lower land costs but deferral of non-essential management and monitoring of these lands for up to 5 years or when development fee revenue is sufficient, whichever comes first (see below for additional details on this option).
- Identifying new funding sources that will cover the costs of operations and maintenance of the Reserve System until fee revenue increases to offset these costs over the long term.
- With the approval of the Wildlife Agencies, defer implementation tasks that are not critical for compliance with the permits, IA, and Habitat Plan, some of which are included in **Table 8-1**.
- Other options that meet the biological goals and objectives of the Plan and are consistent with the permits, IA, and Plan.

As described in Chapter 5, if development fee funding falls short of expectations but the Reserve System is expanding as fast or faster than it should to meet the Stay Ahead requirement, the Implementing Entity may defer management of these lands until development fee funding (or other sources) are available. Specifically, if needed the Implementing Entity may limit management to essential management tasks and defer non-essential management tasks for up to 5 years from the purchase of the first parcel of each reserve unit, or when development fees become available, whichever comes first. Essential management tasks are defined as those tasks necessary to ensure that the condition of the reserve unit does not degrade below the existing condition at the time it was incorporated into the Reserve System in terms of natural land cover and covered species habitat. Existing conditions will be documented by the Implementing Entity through the pre-acquisition assessment and the site inventory, described in Chapters 7 and 8. Management in response to changed circumstances (i.e., remedial actions described in Chapter 10) cannot be deferred.

Over the entire permit term, fee revenue may also fall short of expectations if fewer covered activities occur than assumed under the Plan. Although unlikely, this shortfall will make it difficult for the Permittees to meet their conservation obligations. If it appears that take authorized under the permits will fall short of expectations, substantially reducing fee revenue, the Implementing Entity and other Permittees will work with the Wildlife Agencies to extend the term of the permits to allow the use of the authorized take and allow full implementation of the Plan. As described above, the Local Partners are not expected to, nor are they required to, utilize local general funds for Habitat Plan implementation in the event of funding shortfalls as a result of less fee revenue than expected, either in the short term or the long term.

Alternatively, if revenues fall far short of expectations and it is unlikely that the Permittees will meet their permit obligations they may apply to reduce the authorized take and reduce the permit obligations. Any permit term extension or

request for reductions in Plan obligations will follow the requirements for a major amendment described in Chapter 10.

## **Actions Required Should Non-Fee Funding Fall Short of Expectations**

This chapter describes the non-fee funding sources that are being committed or are expected to be provided by local, state, and federal agencies (see Sections 9.4.2 *Local Funding* and 9.4.3 *State and Federal Funding*). These commitments and expectations are based on conservative assumptions and a track record of providing similar funding locally or to other HCPs and NCCPs in northern California. Despite these assumptions, it is possible that these non-fee funding sources will fall short of expectations. These local sources are intended to contribute to conservation actions (i.e., not mitigation). If these funding sources fall short, then the Implementing Entity may have difficulty meeting its obligation to provide for the conservation of some of the covered species.

In the event of shortfalls in non-fee funding, the Implementing Entity will make reasonable adjustments to expenditures to meet the obligations of the Habitat Plan. If these adjustments are inadequate to address the shortfall, the Implementing Entity will consult with the Wildlife Agencies regarding the best course of action. As described above, the Local Partners are not expected to, nor are they required to, utilize local general funds for Habitat Plan implementation in the event of funding shortfalls as a result of less non-fee revenue than expected. Actions considered will include reducing take authorization and conservation obligations in proportion to the funding shortfall. Such reductions would need to follow the major amendment process described in Chapter 10.

## **Funding for Post-Permit Management and Monitoring**

After the permit term, all of the Permittees are obligated to continue to protect, manage, and maintain the Reserve System<sup>37</sup>. This includes adaptive management and monitoring at a level sufficient to determine whether management is effective. Other obligations, however, disappear after the permit term. For example, the Permittees are no longer obligated to annually report the status of the Plan to the Wildlife Agencies. Three to 5 years prior to the termination of the permit, the Permittees will determine how to handle the continuing obligations of the Implementing Entity with the approval of the Wildlife Agencies. Preservation, enhancement, restoration, and creation obligations will also be completed prior to the end of the permit term and will not continue post-permit. Remedial measures and contingency also no longer need to be funded after the permit term.

---

<sup>37</sup> The Implementing Entity may or may not exist after the permit term. Regardless, all Permittees have the obligation to maintain the Reserve System after the permit term.

Detailed assumptions regarding post-permit costs are presented in **Appendix G**. Annual costs to operate and maintain the Reserve System in perpetuity are estimated to be approximately 64% of the annual cost for program administration estimated during Years 46–50, 80% of reserve management and maintenance costs, and 34% of monitoring costs (**Table 9-4**). Total post-permit costs are estimated to be approximately \$2.9 million annually. Actual long-term costs may be lower if the Implementing Entity can develop streamlined procedures for management and monitoring during the permit term or reduce administrative costs. Responsibility for funding long-term management and monitoring rests solely with the Permittees.

Funding provided by interest on the endowment is expected to fully fund post-permit costs. Any shortfalls in the endowment during the permit term will be identified by the 5-year funding assessments conducted by the Implementing Entity. If the endowment is not growing fast enough to reach its target size, then the endowment fee portion of the development fees will be increased to make up the shortfall. With these built-in safeguards in the endowment, post-permit funding is expected to be adequate to fully offset post-permit costs of management and monitoring.

Table 9-1. Summary of Habitat Plan Implementation Cost Estimate

Final Plan

2010 dollars

Total Budget (rounded to the nearest ten thousand)

	Total Cost per Implementation Period (Years)											Total	Annual Average
Budget Category	0	1-5	6-10	11-15	16-20	21-25	26-30	31-35	36-40	41-45	46-50

**Table 9-2. Santa Clara Valley Habitat Plan Reserve System Summary**

	Acres
Permanent Impact <sup>1</sup>	17,975
<b>New Acquisition for the Reserve System</b>	
Mitigation <sup>2</sup>	20,112
Enhancement	15,988
<i>Subtotal</i> <sup>3</sup>	<i>36,100</i>
<b>Existing Open Space Contributed to the Reserve System<sup>4</sup></b>	
County of Santa Clara Parks and Recreation Department	12,291
Santa Clara County Open Space Authority	1,000
<i>Subtotal</i>	<i>13,291</i>
<b>Total Estimated Minimum Size of the Reserve System<sup>5</sup></b>	<b>49,391</b>

<sup>1</sup> See **Table 4-2**.

<sup>2</sup> See *Development Fee Nexus Study* for calculation of mitigation requirement for Reserve System.

<sup>3</sup> Includes 1,100 acres of interim conservation lands (acquisition between signing of the 2007 Planning Agreement and issuance of Plan permits) by County Parks (see **Table 5-5**). To the extent that these are non-wetland land covers this land could be mitigation in lieu of the County's development fee obligation for County covered activities (not private development). Otherwise these lands would apply to the enhancement component of the Reserve System.

<sup>4</sup> See **Table 5-5**.

<sup>5</sup> The total size of the Reserve System will be at least 46,496 acres and up to an estimated 46,920 acres. The acreage 49,391 is a sum of acres of assumed acquired lands plus existing open space. The assumption for acquired acres is based on a hypothetical Reserve System design that meets all of the minimum acquisition requirements as described in **Table 5-13**.

**Table 9-3.** Summary of Annual Management and Monitoring Costs per Acre

2010 dollars

**Total Budget (rounded to the nearest ten thousand)**

<b>Total</b>	<b>\$2,740,000</b>	<b>\$63,000</b>	<b>65%</b>
Land Acquired and Managed for Reserve System <sup>2</sup>	34,153		
Existing Open Space Managed for Reserve System	13,291		
Total Acres Managed / Wetlands Restored	<b>47,444</b>	<b>506</b>	
Average Annual Cost per Acre Managed, New Reserve System	\$50	\$120	
Average Annual Cost per Acre Managed, Existing Open Space	\$70		

Notes:

Detail may not add to total due to rounding at various stages of the calculations.

<sup>1</sup> For details on the assumptions for these calculations, see the Cost Model in Appendix G, sheets "9-4 SummaryPostPermitBudget" and "G-9 Assumptions\_PostPermit."

<sup>2</sup> Includes the total acres of preserved and restored or created land cover types that will be managed in perpetuity.

**Table 9-5. Funding Sources**

Funding Source	Final Plan Amount	% of Funding	Source
<b>Development Fees</b>			
Land Cover and Nitrogen Deposition Fees			
Private Development (all jurisdictions)	\$ 163,440,000	25%	Local
County of Santa Clara <sup>1</sup>	\$ -	0%	Local
City of San Jose	\$ 2,000,000	0%	Local
City of Gilroy	\$ 80,000	0%	Local
City of Morgan Hill	\$ 290,000	0%	Local
Santa Clara Valley Water District	\$ 8,090,000	1%	Local
Santa Clara Valley Transportation Agency	\$ 1,560,000	0%	Local
Serpentine Fee <sup>1</sup>	\$ 29,270,000	4%	Local
Wetland Fee (private development and public agencies)	\$ 77,600,000	12%	Local
Burrowing Owl Fee	\$ 8,830,000	1%	Local
Temporary Impact Fees (all public agencies)	\$ 16,010,000	2%	Local
Endowment Fee Component	\$ 36,500,000	6%	Local
Plan Preparation Fee Component <sup>2</sup>	\$ 3,010,000	0%	Local
Participating Special Entity Fees	\$ 17,000,000	3%	Local
<b>Total Fee Funding</b>	<b>\$ 363,680,000</b>	<b>55%</b>	
<b>Non-Fee Funding</b>			
<b>Other Local Funding</b>			
County of Santa Clara Parks and Recreation Land Acquisition <sup>1,3</sup>	\$ 45,980,000	7%	Mixed <sup>7</sup>
Land Acquisition by Local Land Agencies, Non-Profits, and Foundations <sup>3,4</sup>	\$ 77,270,000	12%	Mixed <sup>7</sup>
Interest Income on Permit Period Funding <sup>5</sup>	\$ 2,180,000	0%	Local
Endowment Investment Income <sup>6</sup>	\$ 53,640,000	8%	Local
Total Other Local Funds	\$ 179,070,000	27%	
<b>State and Federal Funding</b>			
New Wildlife Agency Funds (Section 6, etc.)	\$ 115,000,000	17%	Mixed
<b>Total Non-Fee Funding</b>	<b>\$ 294,070,000</b>	<b>45%</b>	
<b>Total Funding and Plan Costs</b>			
Total Funding	\$ 657,750,000	100%	
Plan Implementation Budget (excl. Plan Preparation and Endowment)	\$ 564,040,000		
Plan Preparation Costs	\$ 3,010,000		
Endowment Balance at End of Permit Period	\$ 90,140,000		
Total Cost of Plan and Endowment	\$ 657,190,000		
Surplus / (Deficit)	\$ 560,000		

<sup>1</sup> Development fees except for permanent and temporary wetland mitigation fees for County of Santa Clara covered activities (County Parks and County Roads and Airports) are excluded because fees would be more than offset by County Parks acquisition of land for Reserve System (estimated at 5,950 acres).

<sup>2</sup> Net plan preparation costs were reduced by 20% to exclude estimated costs associated with recovery and limit costs for the purposes of the development fee to mitigation-related planning only.

<sup>3</sup> Acquisition costs based on average per acre costs for Plan including transaction costs.

<sup>4</sup> Cost of land to be provided agencies and organizations that acquire and preserve land in Santa Clara County (estimated at 10,000 acres) such as the Santa Clara County Open Space Authority, the Peninsula Open Space Trust, The Nature Conservancy, The Silicon Valley Land Conservancy, David and Lucille Packard Foundation, the Gordon and Betty Moore Foundation, and others.

<sup>5</sup> Estimated interest earned on permit term operating fund balances generated by development fees. Based on 3% annual interest (recommended by County of Santa Clara Finance Department) applied to a fund balance estimated to equal 20% of average annual total development fee revenue.

<sup>6</sup> Based on an assumed real interest rate of 3.25% over inflation applied to endowment fee revenue, consistent with projected returns on long-term endowment investment funds held for the California Department of Fish and Game by the National Fish and Wildlife Foundation.

<sup>7</sup> Funding sources may be a mix of local sources, state grants, and federal grants from agencies such as the California Coastal Conservancy and State Wildlife Conservation Board.

**Table 9-6. Land Cover Development Fees**

Development Fee Type <sup>1,2</sup>	Unit	Projected Initial Fee Amount <sup>3</sup>	Alternative Payment Mechanisms <sup>4</sup>
<b>Land Cover Fee</b>			
Zone A: Mostly natural lands	per acre	\$ 15,416	Land in lieu; mitigation bank credit
Zone B: Mostly agricultural and valley floor rural residential lands	per acre	\$ 10,688	Land in lieu; mitigation bank credit
Zone C: Small vacant sites between 0.5 and 10 acres surrounded by urban development	per acre	\$ 3,905	Land in lieu; mitigation bank credit
<b>Serpentine Fee</b>	per acre	\$ 50,166	Land in lieu (must be serpentine)
<b>Nitrogen Deposition Fee</b>	per new vehicle trip	\$ 3.60	Other mechanism determined during implementation
<b>Burrowing Owl Fee</b>	per acre	\$ 50,438	Land in lieu (must be occupied nesting habitat)
<b>Wetland Fee</b>			
Willow Riparian Forest and Mixed Riparian	per acre	\$ 139,708	Wetland mitigation in lieu; mitigation bank credit
Central California Sycamore Woodland	per acre	\$ 255,182	Wetland mitigation in lieu; mitigation bank credit
Freshwater Marsh	per acre	\$ 171,322	Wetland mitigation in lieu; mitigation bank credit
Seasonal Wetlands	per acre	\$ 374,842	Wetland mitigation in lieu; mitigation bank credit
Pond	per acre	\$ 153,321	Wetland mitigation in lieu; mitigation bank credit
Stream	per linear ft.	\$ 588	Wetland mitigation in lieu; mitigation bank credit
<b>Temporary Impact Fee</b>			
Land Cover	per acre	Varies <sup>5</sup>	Land in lieu; mitigation bank credit
Serpentine	per acre	Varies <sup>5</sup>	Land in lieu (must be serpentine)
Burrowing Owl	per acre	Varies <sup>5</sup>	Land in lieu (must be occupied nesting habitat)
Wetland	per acre	Varies <sup>5</sup>	Wetland mitigation in lieu; mitigation bank credit

<sup>1</sup> See Chapter 9 for details of each development fee and in what circumstances it is required.

<sup>2</sup> The Endowment fee and Plan Preparation fee are included in the appropriate Habitat Plan fees listed in this table as described in Chapter 9.

<sup>3</sup> Projected initial fees would apply only in the first year of Plan implementation. All development fees would be adjusted (up or down) on an annual basis by a date determined by the Implementing Entity's Governing Board within the first 6 months of Plan implementation.

<sup>4</sup> All fees may be paid in cash or, at the discretion of the Implementing Entity, through implementation of conservation actions.

<sup>5</sup> Temporary fee varies based on duration of impact. See Chapter 9 text for details.

**Table 9-7a.** Habitat Plan Land Cover Development Fees and Estimated Revenue

Item	Fee Zone <sup>1</sup>			Serpentine Fee <sup>2</sup>	Total
	Zone A: Mostly Natural Lands	Zone B: Mostly Agricultural and Rural Residential Lands	Zone C: Small Vacant Sites		
Land Cover Fee at Start of Permit Term <sup>3</sup>	\$13,630 per acre	\$9,450 per acre	\$3,453 per acre	\$44,355 per acre	
Endowment Fee Component at Start of Permit Term <sup>3</sup>	\$1,595	\$1,106	\$404	\$5,190	
Plan Preparation Cost Recovery Fee Component at Start of Permit Term <sup>3</sup>	\$191	\$132	\$48	\$621	
Total Fee per Acre	\$15,416	\$10,688	\$3,905	\$50,166	
Estimated Approximate Cost per Housing Unit in Cities <sup>4</sup>	\$3,854	\$2,672	\$976	\$16,396	
Estimated Approximate Cost per Housing Unit in County (Low/High) <sup>5</sup>	\$7,708 / \$46,248	\$5,344 / \$32,064	Not applicable	\$32,791 / \$196,746	
Estimated Acres of Impact in Fee Zones (Zone A, B, and C) over the Permit Term <sup>6</sup>	5,670 acres	11,400 acres	600 acres	675 acres	17,670 acres <sup>7</sup>
Estimated Land Cover Fee Revenue <sup>8,9</sup> (2010 dollars) over the Permit Term	\$59,320,000	\$104,470,000	\$1,550,000	\$29,270,000	\$194,610,000

## Notes:

- <sup>1</sup> As defined in **Figure 9-1** and in Chapter 9. Zone names are provided only as a general guide to dominant land cover (**Figure 9-2**). The nitrogen deposition fee is also assessed in every zone for applicable covered activities.
- <sup>2</sup> Serpentine fee will be charged in addition to the base land cover fee for the zone where the project is located for any impacts in serpentine land cover types (serpentine bunchgrass grassland, serpentine chaparral, serpentine seep, and serpentine rock outcrop). Serpentine land cover types primarily occur in Zone A.
- <sup>3</sup> See *Development Fee Nexus Study* for fee calculation methods. All fees will be adjusted for inflation or deflation according to **Table 9-12** and the terms of the Habitat Plan; consult planning staff with your participating jurisdiction for the latest Habitat Plan fees.
- <sup>4</sup> Assumes average housing density of 4.0 units per acre for Zone A, B, and C. This is an estimate only; fees will be charged on a per acre basis, not on a per unit basis.
- <sup>5</sup> Low estimate assumed a 0.5 acre lot; fee paid on entire parcel. High estimate assumes 3.0 acres of development envelope on a parcel size of 10 acres or more; fee paid on the size of the development envelope.
- <sup>6</sup> Excludes impacts associated with conservation strategy implementation. Implementation of the conservation strategy is expected to have net benefits for covered species and the Implementing Entity will not pay fees to itself for its impacts.
- <sup>7</sup> Zone A, B and C impacts. Serpentine land cover impacts are already included in this total for Zone A.
- <sup>8</sup> Estimated revenue does take into account credit that might be applied to public agencies that owe development fees but also contribute funding for conservation (e.g., County Parks). See text for details.
- <sup>9</sup> Does not include projected revenue from endowment and plan preparation fee components that are shown separately in **Table 9-5**.

**Table 9-7b.** Habitat Plan Nitrogen Deposition Fee and Estimated Revenue

Item	Amount
Nitrogen Deposition Fee per New Daily Vehicle Trip at Start of Permit Term (applied in all Fee Zones) <sup>1</sup>	\$3.19
Endowment Fee per New Daily Vehicle Trip at Start of Permit Term (applied in all Fee Zones)	\$0.37
Plan Preparation Fee per New Daily Vehicle Trip at Start of Permit Term (applied in all Fee Zones)	\$0.04
Total Fees Charged per New Daily Vehicle Trip	\$3.60
Plan Area Average Daily Trip Growth During Permit Term <sup>2</sup>	3,176,000
Projected Nitrogen Deposition Fee Revenue (2010 dollars) <sup>3</sup>	\$10,120,000
Approximate Cost per Single Family Housing Unit <sup>4</sup>	\$34

## Notes:

<sup>1</sup> See text and **Table 9-10** for fee calculation methods. All fees will be adjusted for inflation or deflation according to **Table 9-12** and the terms of the Habitat Plan; consult planning staff with your participating jurisdiction for the latest Habitat Plan fees.

<sup>2</sup> Estimate only; fees will be charged based on new average daily vehicle trips.

<sup>3</sup> Does not include revenue from endowment and plan preparation fee components that are shown separately in **Table 9-5**.

<sup>4</sup> Assumes 9.57 average daily trips per single family housing unit.

**Table 9-8. Endowment Fee Calculations**

	All Reserve Lands	Restored Wetland Only
Annual Endowment Fund Revenue Needed During Permit Term (2010\$)	\$ 720,000	\$ 10,000
Permit Term (years)	50	50
Endowment Fee Revenue Needed During Permit Term (rounded)	\$ 36,000,000	\$ 500,000
Total Projected Development Fee Revenue <sup>1</sup>	\$ 307,170,000	\$ 91,550,000
Endowment Cost Factor	0.117	0.005
Endowment Cost Factor for All Reserve Lands Excluding Restored Wetland		0.117
Endowment Cost Factor for Restored Wetland		0.122

Fee Category	Base Fee Amount	Endowment Cost Factor	Fee Component
<i><u>Land Cover Fees (per acre)</u></i>			
Zone A	\$ 13,630	0.117	\$ 1,595
Zone B	9,450	0.117	1,106
Zone C	3,453	0.117	404
Serpentine Fee (per acre)	\$ 44,355	0.117	\$ 5,190
Nitrogen Deposition Fee (per vehicle trip)	\$ 3.19	0.117	\$ 0.37
Burrowing Owl Fee (per acre)	\$ 44,596	0.117	\$ 5,218
Wetland Fee (per acre, per foot for streams)			
Willow Riparian Forest and Scrub	\$ 122,982	0.122	\$ 15,004
Central California Sycamore Alluvial Woodland	224,632	0.122	27,405
Mixed Riparian Forest and Woodland	122,982	0.122	15,004
Coastal and Valley Freshwater Marsh	150,812	0.122	18,399
Seasonal Wetland	329,966	0.122	40,256
Pond	134,965	0.122	16,466
Streams	518	0.122	63
Temporary Fee (per acre)			
Land Cover	Varies <sup>2</sup>	0.117	Varies <sup>2</sup>
Wetland	Varies <sup>2</sup>	0.117	Varies <sup>2</sup>

<sup>1</sup> Includes projected fee revenue for permanent and temporary land cover and wetland mitigation, nitrogen deposition, serpentine, and burrowing owl.

<sup>2</sup> Applicable base fee adjusted for duration of impact.

**Table 9-9. Plan Preparation Cost Recovery Fee Calculations**

Plan Preparation Costs			\$	6,350,000
Less: Section 6 Grant				1,107,648
Plan Preparation Costs Funded by Local Partners			\$	5,242,352
Mitigation Share of Plan Preparation Cost <sup>1</sup>				80%
Mitigation-Related Plan Preparation Cost			\$	4,190,000
Total Projected Development Fee Obligation <sup>2</sup>			\$	307,170,000
Plan Preparation Cost Factor				0.014
Fee Category	Base Fee Amount	Plan Preparation Cost Factor	Fee Component	
<i>Land Cover Fees (per acre)</i>				
Zone A	\$ 13,630	0.014	\$	191
Zone B	9,450	0.014		132
Zone C	3,453	0.014		48
Serpentine Fee (per acre)	\$ 44,355	0.014	\$	621
Nitrogen Deposition Fee (per vehicle trip)	\$ 3.19	0.014	\$	0.04
Wetland Fees (per acre)				
Willow Riparian Forest/Mixed Riparian	\$ 122,982	0.014	\$	1,722
Central Calif. Sycamore Woodland	224,632	0.014		3,145
Freshwater Marsh	150,812	0.014		2,111
Seasonal Wetland	329,966	0.014		4,620
Pond	134,965	0.014		1,890
Streams (per linear foot)	518	0.014		7
Burrowing Owl Fee (per acre)	\$ 44,596	0.014	\$	624

<sup>1</sup> Based on an estimate that preparing an HCP-only Plan would cost approximately 80% of the costs incurred to prepare the Habitat Plan.

<sup>2</sup> Includes land cover, serpentine, nitrogen deposition, wetland mitigation, burrowing owl and temporary development fees.

**Table 9-10. Habitat Plan Nitrogen Deposition Fee Calculation**

Serpentine Management & Monitoring Cost Mitigation Related to Nitrogen Deposition <sup>1</sup>	\$ 5,310,000
Other Mitigation Costs Related to Nitrogen Deposition <sup>2</sup>	<u>14,930,000</u>
Total Mitigation Costs Related to Nitrogen Deposition	\$ 20,240,000
Share of Nitrogen Deposition from Plan Area <sup>3</sup>	<u>50%</u>
Plan Area Share of Nitrogen Deposition Mitigation Costs	\$ 10,120,000
Plan Area Vehicle Trip Growth	<u>3,176,000</u>
<b>Nitrogen Deposition Fee per New Vehicle Trip</b>	<b>\$ 3.19</b>

<sup>1</sup> Additional per-acre management and monitoring costs for serpentine land covers estimated at \$2,148 (\$4,360 total serpentine costs minus \$2,212 average cost for other land covers). An estimated 2,704 acres of serpentine land in the Reserve System is for mitigation based on estimated serpentine land cover impacts and a 4:1 mitigation ratio. Total additional management and monitoring costs for serpentine mitigation lands in the reserve is \$5.81 million (\$2,148 x 2,704).

<sup>2</sup> Includes 20% of mitigation costs for land covers known to be sensitive to nitrogen deposition, and 10% of mitigation costs for land covers that may be sensitive to nitrogen deposition. See *Development Fee Nexus Study* for more details.

<sup>3</sup> Based on calculations in **Appendix E**.

**Table 9-11.** Wetland Fees by Land Cover Type

Land Cover Type	Total per Unit Cost <sup>1</sup>	Required Compensation Ratio for Restoration/Creation <sup>2</sup>	Restoration Fee per Unit of Impact <sup>3</sup>	Endowment Component <sup>4</sup>	Plan Preparation Component <sup>5</sup>	Total Fee	Method for Determining Fee Boundary
Willow and mixed riparian forest, woodland, and scrub	\$122,982/acre	1:1	\$122,982/acre	\$15,004/acre	\$1,722/acre	\$139,708/acre	Limit of tree or shrub canopy (drip line)
Central California sycamore alluvial woodland	\$112,316/acre	2:1	\$224,632/acre	\$27,405/acre	\$3,145/acre	\$225,182/acre	Limit of tree or shrub canopy (drip line)
Coastal and valley freshwater marsh	\$150,812/acre	1:1	\$150,812/acre	\$18,399/acre	\$2,111/acre	\$171,322/acre	Wetland boundary as determined through methods described in Section 6.8.4

Ponds	\$134,965/acre	1:1	\$134,965/acre	\$16,466/acre	\$1,890/acre	\$153,321/acre	Same as for coastal and valley freshwater marsh
Streams	\$518/linear foot	1:1	\$518/linear foot	\$63/linear foot	\$7/linear foot	\$588/linear foot	Stream length measured along stream centerline

<sup>1</sup> See *Development Fee Nexus Study* for restoration cost assumptions and calculation of total cost for each land cover type.

<sup>2</sup> Source: **Table 5-13.**

<sup>3</sup> Restoration cost multiplied by compensation ratio.

<sup>4</sup> Source: **Table 9-8.**

<sup>5</sup> Source: **Table 9-9.**

**Table 9-12. Fee Adjustment Indices**

Fee	Annual Adjustment Index <sup>1</sup>	Historic Range of Index (Years)	Average Annual Rate of Index (Years)
Land Cover, Serpentine, and Nitrogen Deposition Fees			
a. Portion for Land Acquisition <sup>2</sup> (46% initially <sup>3</sup> )	Change in the annual House Price Index (HPI) for the San Jose-Sunnyvale-Santa Clara, CA Metropolitan Statistical Area (MSA) for the prior calendar year (Federal Housing Finance Agency) <sup>4</sup>	–12.74% to 33.96% (1977 to 2009)	8.33% (1977 to 2009)
b. Portion for Preserve System Operation, Restoration, and Maintenance (54% initially <sup>3</sup> )	Change in the Consumer Price Index for the San Francisco-Oakland-San Jose Combined Statistical Area for all urban consumers for the prior calendar year (U.S. Bureau of Labor Statistics) <sup>5</sup>	–10.0% to 18.35% (1915 to 2009)	3.57% (1915 to 2009)
Wetland and Burrowing Owl Fees	Same as b (Consumer Price Index)		
Notes:			
<sup>1</sup> Habitat Plan fees to be adjusted on an annual basis by a date determined by the Implementing Entity's Governing Board within the first 6 months of Plan implementation based on the indices for the prior calendar year.			
<sup>2</sup> Direct land acquisition costs only. Excludes costs associated with land transaction, site improvements, and due diligence (e.g., pre-acquisition surveys).			
<sup>3</sup> The portion of the base development fee and temporary impact fee that will be adjusted according to the HPI and CPI will vary over time. For the first annual automatic adjustment, 46% of the initial fees will be adjusted according to the HPI and 54% will be adjusted according to the CPI. The apportionment in subsequent years will depend on the proportional estimate of land cost to the rest of Plan costs.			
<sup>4</sup> See < <a href="http://www.fhfa.gov">http://www.fhfa.gov</a> >. Data for the prior calendar year are published in March.			
<sup>5</sup> Consumer Price Index, All Items, with base data year of 1982–1984 (i.e., 1982–1984 = 100), for all urban consumers (CPI-U), not seasonally adjusted. See < <a href="http://www.bls.gov/">http://www.bls.gov/</a> >.			

**Table 9-13.** Federal and State Funding Sources for HCPs and NCCPs in California

Program Name	Program Administrator	Funding Source	Funding Available in California	Year	Description	Eligibility	Santa Clara Valley Habitat Plan Potential
Endangered Species Act Section 6 Grants	U.S. Fish and Wildlife Service, California Department of Fish and Game	Federal	\$194,891,458	2007–2011 annual average	Grants for HCP land acquisition; current USFWS policy requires non-federal match of 25% that cannot be from local mitigation fees.	HCPs	Strong
Land and Water Conservation Fund	California Department of Parks and Recreation	Federal	\$1,275,155	2007	Dollar-for-dollar matching grants for planning, acquisition, and development of outdoor recreation areas and facilities	Cities, counties and districts with authority to acquire, develop, operate and maintain public park and recreation areas	Moderate; used by County Parks in past
Farm and Ranch Land Protection Program	Natural Resource Conservation Service	Federal	\$2,407,474	2007	USDA provides up to 50% of conservation easement value; requires partnerships with other agencies.	Active farm and ranch lands	Very limited
Environmental Quality Incentives Program	Natural Resource Conservation Service	Federal	\$74,384,767	2011	Financial assistance to plan and implement conservation practices that address natural resource concerns and for opportunities to improve soil, water, plant, animal, air and related resources on agricultural land and non-industrial private forestland.	Owners of active agricultural, forest production, or ranch lands that have a natural resource concern.	Uncertain; higher likelihood for projects that align with annual natural resource concern initiatives
Wildlife Habitat Incentive Program	Natural Resource Conservation Service	Federal	\$3,601,152	2011	Provides technical and financial assistance to landowners and others to develop upland, wetland, aquatic, and other types of habitat that supports fish and wildlife populations of National, State, Tribal, and local significance.	Private agricultural land including cropland, grassland, rangeland, pasture, and other land suitable for fish and wildlife habitat development, nonindustrial private forest land including rural land that has existing tree cover or is suitable for growing trees, and Indian land.	Uncertain

Table 9-13. Continued

Program Name	Program Administrator	Funding Source	Funding Available in California	Year	Description	Eligibility	Santa Clara Valley Habitat Plan Potential
North American Wetlands Conservation Act Grant Program	U.S. Fish and Wildlife Service	Federal	\$9,485,299	2006–2007	Program provides matching grants to aid in wetland conservation projects, including land acquisition, restoration, and enhancement. Non-federal match must be at least 1:1.	Non-federal agencies, organizations, or individuals	Uncertain
Landscape Conservation Cooperatives	U.S. Fish and Wildlife Service	Federal	\$18,000,000	2011–2012	New program to apply strategic habitat conservation through partnerships with other federal agencies, states, tribes, NGOs, and stakeholders. Program established to improve science and management decisions in response to climate change.	Habitat Plan within California Landscape Conservation Cooperative, one of 16 established throughout the country.	Uncertain
Central Valley Project (CVP) Improvement Act Habitat Restoration Program	U.S. Fish and Wildlife Service and U.S. Bureau of Reclamation	Federal	\$1,000,000–4,000,000 annually	1996 to present	Provides funds for land acquisition, management, monitoring, research, restoration for endangered / threatened species impacted by the CVP.	Federal and State government agencies, private non-profit or profit organizations, and individuals	Strong
Sustainable Communities Planning Grant Program	U.S. Department of Housing and Urban Development	Federal	\$100,000,000 nationwide	2011	Provides funds to cities and counties to improve regional planning efforts that increase the capacity to improve land use and zoning.	Undetermined; new program	Unknown
Habitat Conservation Fund	California Department of Parks and Recreation	State, Other <sup>1</sup>	\$2,000,000	2007	Program requires dollar for dollar match from non-state source for wetlands, riparian, trails/programs and anadromous/trout categories.	Cites, counties and districts	Moderate; used by County Parks in past

Table 9-13. Continued

Program Name	Program Administrator	Funding Source	Funding Available in California	Year	Description	Eligibility	Santa Clara Valley Habitat Plan Potential
Recreational Trail Fund	California Department of Parks and Recreation	Federal <sup>2</sup>	\$6,037,429	2008	Federal money for non-motorized trail projects; RTP will provide up to 80% of total project costs.	Cities, counties, districts, state agencies and nonprofit organizations with management responsibilities over public lands	Moderate; used by County Parks in past
San Francisco Bay Area Conservancy <sup>3</sup>	California Coastal Conservancy	State, Proposition 40	\$40,000,000	Total funding allocation through time	Funding from Proposition 40 and Proposition 50 for acquisition, development, rehabilitation, restoration and protection of land resources and for Bay Area coastal watershed and wetlands protection, plus acquisition of agricultural and open space properties.	The State Coastal Conservancy, public agencies and nonprofit organizations (land trusts)	Nearly fully encumbered, but \$1.6 million is budgeted for projects that may be compatible with the Habitat Plan. Used by County Parks in past.
Soap Lake Floodplain Preservation Grant Program	Pajaro River Watershed Flood Prevention Authority	State, Proposition 50 (Chapter 8)	\$3,500,000	2008	Grants for land acquisition and easements in Soap Lake area (Santa Clara and San Benito Counties)	TBD	Likely strong
CalFed Bay-Delta Programs	California Bay Delta Authority and other California agencies	State, Proposition 50	\$270,000,000	Total funding allocation through time	Various programs funded by Proposition 50 for habitat restoration and protection, conservation and restoration of watersheds.	State, federal, local and non-governmental agencies are eligible.	Moderate

Table 9-13. Continued

Program Name	Program Administrator	Funding Source	Funding Available in California	Year	Description	Eligibility	Santa Clara Valley Habitat Plan Potential
Safe Drinking Water, Water Quality and Supply, Flood Control, River and Coastal Protection Bond Act of 2006 - Forest and Wildlife Conservation	Wildlife Conservation Board, State Coastal Conservancy, California Department of Parks and Recreation	State, Proposition 84	\$450,000,000	Total funding allocation through time	Proposition 84 provides various funding allocations for forest conservation and protection projects and development, rehabilitation, restoration, acquisition and protection of habitat. This includes specific funding for NCCP implementation. \$10 million allocated to Wildlife Conservation Board for NCCPs in 2009 state budget.	\$180,000,000 is allocated for forest conservation and protection projects; \$135,000,000 is allocated for development, rehabilitation, restoration, acquisition and protection of habitat; \$90,000,000 is allocated for NCCP establishment or implementation; \$45,000,000 is allocated for the protection of ranches, farms, and oak woodlands;	Strong
Same as above	Strategic Growth Council	State, Proposition 84 (Chapter 8)	\$60,000,000	2010–2013	The Sustainable Communities Planning Grant and Incentive Program.	The program provides \$48 million to support development and implementation of local plans to help the state meet AB32 greenhouse gas emission reduction targets and implement SB375. Cities and counties developing or implementing NCCPs are eligible.	Strong
“Mountain Lion Fund”	State Coastal Conservancy, California Department of Parks and Recreation, Wildlife Conservation Board	State, Proposition 117	\$30,000,000	Annual funding through 2020	Proposition 117 provides at least \$30 million statewide each year for wildlife habitat preservation, including wetlands, stream and riparian habitat. Half must be spent in northern California.	\$21 million is allocated to the WCB for purposes of the Dept. of Fish and Game. \$4.5 million is allocated for local park, recreation and open space agencies as matching awards from the state. \$4.5 million is for the Coastal and Tahoe Conservancy.	Moderate; used by County Parks once in 1990’s for joint acquisition with MROSD (Jacques Ridge property)

**Table 9-13.** Continued

Program Name	Program Administrator	Funding Source	Funding Available in California	Year	Description	Eligibility	Santa Clara Valley Habitat Plan Potential
Clean Water State Revolving Fund	Environmental Protection Agency	Revolving fund	\$67,105,000	2007	Revolving fund provides low-interest loans for projects that improve water quality and reduce nonpoint source pollution, including wetland preservation, restoration and creation, and the protection of vernal pools and associated habitat such as oak woodlands. Loans can cover 100% of project costs with no cash up front.	Revolving fund loans are available to local governments, non-profits, municipalities, farmers, and homeowners.	Moderate

<sup>1</sup> Initiated by the California Wildlife Protection Act of 1990.

<sup>2</sup> Administered at the federal level by the Federal Highway Administration.

<sup>3</sup> The San Francisco Bay Area Conservancy obtains funds via the Statewide California Coastal Conservancy program. The broader California Conservancy program also funds other projects in the San Francisco Bay Area, though they are all directly on the coastline, not in Contra Costa County.

## Chapter 10

# Assurances

### 10.1 Introduction

This chapter discusses the assurances requested by the Permittees that will accompany the ESA Section 10(a)(1)(B) permits issued by USFWS and the NCCP permit issued by CDFG. This chapter also discusses assurances that will be provided to private landowners bordering Habitat Plan reserves, and outlines the process for changing or amending the Habitat Plan.

### 10.2 Assurances Requested by Permittees

The Permittees are requesting the following assurances from the Wildlife Agencies. Assurances specific to state or federal agencies are requested in Sections 10.2.3 *Federal Section 7 Consultations* (USFWS) and 10.2.7 *Assurances for Private Landowners* (CDFG).

#### 10.2.1 Changed and Unforeseen Circumstances

##### Changed Circumstances

Changed circumstances are defined in the federal No Surprises Regulation<sup>1</sup> and for the state of California in the NCCP Act<sup>2</sup>. The federal No Surprises Regulation defines changed circumstances as those circumstances affecting a species or geographic area covered by the HCP that can be reasonably anticipated by the applicant or federal wildlife agencies and that can be planned for. Similarly, state regulation defines changed circumstances as those circumstances that are reasonably foreseeable and could affect a covered species or geographic area covered by the plan. Accordingly, these regulations require that potential changed circumstances be identified in the Plan along with remedial measures that would be taken to address these changes. The changed circumstances that could arise in the study area have been identified and are described below.

---

<sup>1</sup> 63 Federal Register 35 (1998) (amending 50 CFR 17.22(b)(5), and 222.307(g)).

<sup>2</sup> California Fish and Game Code § 2805(c).

If a changed circumstance occurs within the study area as defined by these sections, the Implementing Entity will notify the Wildlife Agencies of this changed circumstance within seven days after learning that any changed circumstances defined by these sections has occurred. The Implementing Entity will modify its activities in the manner described below, to the extent necessary to address the effects of the changed circumstances on the Plan's conservation strategy, and will report to the Wildlife Agencies on its actions. The Implementing Entity will make such modifications without awaiting notice from the Wildlife Agencies. Pursuant to the No Surprises Regulation, if such changed circumstances were addressed in the Habitat Plan and they occur during the permit term, implementation of their remedial measures is required. The Wildlife Agencies will not require any additional conservation or mitigation to address changed circumstances that are not identified in the Plan, without the consent of the Permittee, as long as the Plan is found to be properly implemented. *Properly implemented* means that the commitments and the provisions of the Plan, Implementing Agreement, and permits have been or are being fully implemented. In addition, the Wildlife Agencies will not require measures to address changed circumstances that are identified in the Plan beyond the remedial measures identified in the Plan.

## Unforeseen Circumstances

Unforeseen circumstances are defined by federal regulation (50 CFR §17.3) as:

changes in circumstances affecting a species or geographic area covered by a conservation plan or agreement that could not reasonably have been anticipated by plan or agreement developers and the Service at the time of the conservation plan's or agreement's negotiation and development, and that result in a substantial and adverse change in the status of the covered species.

The NCCP Act (California Fish and Game Code Section 2805[j]) defines unforeseen circumstances as:

changes affecting one or more species, habitat, natural community, or the geographic area covered by a conservation plan that could not reasonably have been anticipated at the time of plan development, and that result in a substantial adverse change in the status of one or more covered species.

In the event of unforeseen circumstances during the permit term, amendments to the Habitat Plan may be proposed by either the Implementing Entity or the Wildlife Agencies to address these circumstances. The Wildlife Agencies and the Implementing Entity would work together to identify opportunities to redirect resources to address unforeseen circumstances. However, the Permittees request assurances consistent with the federal No Surprises Regulation and the NCCP Act that the Wildlife Agencies will not:

- require the commitment of additional land, water, or financial compensation by the Permittees in response to unforeseen circumstances other than those agreed to elsewhere in the Habitat Plan; or
- impose additional restrictions on the use of land, water, or natural resources otherwise available for use by the Permittees under the original terms of the Habitat Plan to mitigate the effects of the covered activities or in response to unforeseen circumstances.

As described in the No Surprises Regulation, it is the Wildlife Agencies' responsibility to demonstrate the existence of unforeseen circumstances using the best scientific and commercial data available. For the purpose of this plan, "unforeseen" circumstances are circumstances that are highly unlikely and not reasonably foreseeable to occur and thus will not be funded by this Plan.

The federal No Surprises Regulation does not limit or constrain the USFWS or any federal, state, local, or tribal government agency, or private entity, from taking additional actions at its own expense to protect or conserve covered species. The federal No Surprises Regulation also does not prevent USFWS from asking the Permittees to voluntarily undertake additional mitigation on behalf of the affected species.

## Changed and Unforeseen Circumstances Addressed by this Plan

The changed and unforeseen circumstances listed below are recognized by this Plan (**Table 10-1**). Remedial actions to address changed circumstances are funded by the Plan and are also described below. The Implementing Entity will maintain sufficient financial reserves to fund all remedial actions described below, as they arise. A discussion of each circumstance follows.

- Covered Species Listed.
- Non-Covered Species Listed.
- Global Climate Change.
- Fire.
- Nonnative Species or Disease.
- Flooding.
- Drought.
- Earthquakes.

Other potential changed circumstances were considered but rejected. For example, emergency situations and their corresponding remedial actions are not addressed under the Plan. While we can predict that over the course of a 50-year permit term there will be emergency situations, it is impossible to predict exactly what these emergencies will be. Past emergency situations in the study area that have resulted in the take of covered species include chemical spills, oil

run-off, and spills of garlic processing waste in creeks. Because of the difficulty predicting the size, type, frequency and effect of emergency situations, the Permittees do not consider such events to be changed circumstances under the Plan. If such an event occurs as a result of a Permittee facility or action, the Permittee is responsible for any take that may occur. Each Permittee will assume responsibility for the emergency situation and remedial measures if and when they do occur in the future, just as they would if there were no HCP/NCCP.

## Covered Species Listed

Each covered species in the Habitat Plan has been treated as though it is listed under ESA and CESA. The Permittees propose that all listed and nonlisted covered species be included on the permits. Take of listed plant species by non-federal entities is not prohibited under ESA and therefore the Permittees do not require take authorization. The following plant species are proposed to be included on the federal permits in recognition of the conservation benefits provided for them under the Plan. These species would also receive No Surprises assurances under USFWS's No Surprises Regulation (63 FR 8859-8873; see Section 10.2.3 *Federal Section 7 Consultations* in this chapter).

- Tiburon Indian paintbrush (*Castilleja affinis* subsp. *neglecta*)
- Coyote ceanothus (*Ceanothus ferrisiae*)
- Mount Hamilton thistle (*Cirsium fontinale* var. *campylon*)
- Santa Clara Valley dudleya (*Dudleya setchellii*)
- Fragrant fritillary (*Fritillaria liliacea*)
- Loma Prieta hoita (*Hoita strobilina*)
- Smooth lessingia (*Lessingia micradenia* var. *glabrata*)
- Metcalf Canyon jewelflower (*Streptanthus albidus* ssp. *albidus*)
- Most beautiful jewelflower (*Streptanthus albidus* ssp. *peramoenus*)

The Permittees propose that the Section 10(a)(1)(B) permit be effective for all listed covered species immediately after the adoption of all local implementing ordinances (see Chapter 8, Section 8.5 *Local Implementing Ordinances*). Should USFWS list a covered species during the permit term, take coverage will become effective for that species once the Conference Opinion for that species is converted to a Biological Opinion. No changes to the terms and conditions of the Implementing Agreement or modifications to conservation measures are required.

Under Section 2835 of the California Fish and Game Code, CDFG may issue take authorization for covered species (plants or wildlife) regardless of their listing status. As stated in the NCCP Act, "At the time of plan approval, the [California] department [of Fish and Game] may authorize by permit the taking of any covered species whose conservation and management is provided for in a natural community conservation plan approved by the department."

## Non-Covered Species Listed

Over the course of Plan implementation (50 years), the Wildlife Agencies may list as threatened or endangered under ESA or CESA species that are not covered under the Plan. If a non-covered species becomes listed, the following remedial measures will be taken.

- The potential impacts of covered activities on the newly listed species will be evaluated, including an assessment of the presence of suitable habitat in impact areas.
- The Implementing Entity will develop measures to fully avoid impacts on the newly listed species until the Plan is amended to cover the species or will comply with ESA and CESA via other means (i.e., individual Section 7 consultations, consistency determinations, etc.).

Should a species not covered by the Plan be listed, proposed, or petitioned for listing, the Permittees may request that the Wildlife Agencies add the species to the Section 10(a)(1)(B) permit and NCCP permit. In determining whether or not to seek incidental take coverage for the species, the Permittees will consider, among other things, whether the species is present in the study area and if otherwise lawful activities could result in incidental take of the species. If incidental take coverage is desired, the Plan and permits could be modified or amended. Alternatively, the Permittees could apply for new and separate permits. Procedures for modifications and amendments to the Plan are outlined in Section 10.3 *Modifications to the Plan* below.

## Global Climate Change

Global climate change is occurring as a result of high concentrations of greenhouse gases in the Earth's atmosphere (National Research Council 2010; Intergovernmental Panel on Climate Change 2007). Greenhouse gases include water vapor, carbon dioxide, methane, nitrous oxide, chlorofluorocarbons, and ozone. These gases absorb energy emitted by the Earth's surface, and then re-emit some of this energy back to Earth, warming the Earth's surface, and influencing global and local climates. As more and more greenhouse gases are emitted into the atmosphere from human activities such as the burning of fossil fuels, the Earth's energy balance is disrupted, resulting in a number of changes to the historical climate. Evidence of long-term changes in climate over the twentieth century include the following (Intergovernmental Panel on Climate Change 2007; National Research Council 2010; Global Change Research Program 2009):

- An increase of 0.74 degree Celsius (°C) (1.3 degrees Fahrenheit [°F]) in the Earth's global average surface temperature;
- An increase of 0.17 meter (6.7 inches) in the global average sea level;
- A decrease in arctic sea-ice cover at a rate of approximately 4.1% per decade since 1979, with faster decreases of 7.4% per decade in summer;

- Decreases in the extent and volume of mountain glaciers and snow cover;
- A shift to higher altitudes and latitudes of cold-dependent habitats;
- Longer growing seasons; and
- More frequent weather extremes such as droughts, floods, severe storms, and heat waves.

Current global and regional trends suggest that climate change is likely to have an effect on the study area (see **Appendix F** for a complete discussion). However, current or near-term forecasting technology for modeling changes in climate at the regional or county scale is not effective. By mid-century, the average annual mean temperature in California is projected to rise from 1.1°C (2°F) to more than 2.8°C (5°F), with little to no change in total annual precipitation (Luers et al. 2006). There is significant variability in the precipitation projections by individual model and emissions scenario. Individual simulations suggest that there could be up to a 10 to 20% decrease in total annual precipitation (Luers et al. 2006)<sup>3</sup>. Model predictions for California range from a 6mm (0.24 inches) annual decrease in precipitation to a 70 mm (2.76 inches) annual increase (Hayhoe et al. 2004). Consequently, it is likely that the climate in the study area would shift to be warmer and dryer.

A number of ecological responses to climate change could occur in the study area. First, the timing of seasonal events, such as migration, flowering, and egg laying, may shift earlier or later (Walther et al. 2002; Forister and Shapiro 2003; Root et al. 2003; Root et al. 2005). Such shifts may affect the timing and synchrony of events that must occur together, such as butterfly emergence and nectar availability. Second, range and distribution of species and natural communities may shift (Parmesan 1999; Pimm 2001; Walther et al. 2002; Easterling et al. 2000). Range is the area over which a species occurs or potentially occurs, whereas distribution refers to where a species is located within its range. This is of particular concern for narrowly distributed species that already have restricted ranges due to urban growth or altitudinal gradients. Historically, some species could shift their ranges across the landscape. Today, urban and rural development prevents the movement of many species across the landscape. Species or natural communities that occur only at high elevation (e.g., ponderosa pine woodland in the study area) or within narrow environmental gradients (e.g., Bay checkerspot butterfly, Mount Hamilton thistle) are particularly vulnerable to changing climate because they likely have nowhere to move if their habitat becomes less suitable (Shainsky and Radosevich 1986; Murphy and Weiss 1992; Thorne 2006, PIER Conference; J. Hillman pers. comm.).

Second, increases in disturbance events, such as fire or flooding, could increase the distribution of disturbance-dependent land cover types, such as redwood

<sup>3</sup> The California Climate Change Center report summarizes projections using the National Center for Atmospheric Research Parallel Climate Model (PCM1), Geophysical fluids Dynamic Laboratory (GFDL) CM2.1, and the United Kingdom Met Office Hadley Centre Climate Model, version 3 (HadCM3) under the Intergovernmental Panel on Climate Change (IPCC) Special Report on Emission Scenarios (SRES) B1 (low emissions), A2 (moderately-high emissions), and A1Fi (high emissions).

forest and annual grassland, within the study area (Brown and Hebda 1998; Lenihan et al. 2003; Fried et al. 2004; California Climate Change Center 2006; Rogers and Westfall 2007). An increase in the frequency and intensity of disturbance could increase the likelihood that these events will harm or kill individual covered species, many of which are already quite rare. Events that occur with unpredictable or random frequency (called stochastic events) such as those describe above can have an inordinately negative effect on rare species.

Third, the number or density of individuals found in a particular location may change. This may be triggered in large part by changes in resource availability associated with an increase or decrease in precipitation (Martin 1998; Dukes and Mooney 1999; Walther et al. 2002; Lenihan et al. 2003; Millar et al. 2006; Pounds et al. 2006). Changes such as these may benefit one species at the expense of another.

Fourth, over a longer time period, species may change in outward appearance and behavior. Changes in climate may favor different adaptive strategies or appearances that may lead to genetic shifts (Davis and Shaw 2001). An example of this would be a shift to smaller average body size of certain mammals to use limited food sources for maintenance rather than growth.

The conservation strategy, reserve design, and monitoring and adaptive management program anticipate possible effects of climate change using a multi-scale approach that views conservation through landscape, natural-community, and species level. This approach focuses on protecting and enhancing a range of natural communities, habitat types, and environmental gradients (e.g., altitude, aspect, slope), as well as other features that are important as global warming changes the availability of resources and habitat types in the study area.

Implementing conservation actions that protect a variety of landscapes over a large scale provides flexibility for shifts in range and distribution of species and natural communities due to climate change. Land-acquisition actions target properties that provide connectivity to allow for northward and upslope movement, maintenance and restoration of habitat linkages, and reduced habitat fragmentation. In addition, habitat types across environmental gradients would be targeted for acquisition in the Reserve System to provide topographic diversity, thereby reducing the chance of population extinction (Murphy and Weiss 1992). As a result, some species and natural communities in the study area would continue to be able to “move” in response to climate change, allowing for shifts in range and distribution.

At the natural-community level, conservation and monitoring actions were developed to address natural communities primarily through the enhancement, restoration, and management of vegetation types (i.e., land cover types) and monitoring those changes. Habitats will be managed to ensure natural community and species persistence in the face of abundance shifts driven by climate change. Enhancement, restoration, and management actions will likely increase the resilience of natural communities by improving habitat quality overall and controlling invasive plants and nonnative predators.

At the species level, conservation and monitoring actions were developed to supplement and focus actions developed at broader scales and to ensure that all the needs of particular species are addressed. These species-specific actions will help ensure that shifts of range, distribution, and abundance driven by climate change are buffered by protection and enhancement of individuals, populations, and groups of populations. Status and trends monitoring will serve as an early warning for the possible effects of climate change and will allow the conservation strategy to adapt to ensure species persistence in the study area.

In addition to the conservation actions, monitoring actions will allow for the early detection of trends driven by climate change over multiple scales. Landscape-level monitoring is designed to detect large-scale changes, such as changes in ecosystem processes, shifts in natural-community distribution, and the integrity of landscape linkages. Community-level monitoring would, in turn, detect changes in the composition and function of natural communities, populations of key predator or prey populations, invasive species, and other important habitat factors for covered species. Finally, species-level monitoring would measure the effects of management actions on covered species and the status and trends of covered species in the Reserve System. Collectively, these monitoring actions will allow the Implementing Entity to detect and respond to the effects of climate change. Taken together, conservation and monitoring actions described above will help buffer against the effects of climate change in the study area.

Climate change is considered a foreseeable event and is therefore a changed circumstance. For the purposes of the Plan, limits on the changed circumstance must be identified.

The Implementing Entity will use a method consistent with the California Climate Action Team<sup>4</sup> for measuring temperature change within the study area. The baseline index, as measured from the Gilroy, Morgan Hill, and San José weather stations, will be historic temperatures from 1961 to 1990. For the purposes of the Plan, three baseline measurement periods will be set using 1961 to 1990 historic temperatures: average annual temperature, average summer temperature (June, July, and August), and average winter temperature (December, January, and February). If modeled California climate-change trends are applied to the study area, one may anticipate that the temperature could increase up to 2.8°C during the permit term. Under the Plan, the following is considered changed circumstances for which remedial measures will be funded.

- An increase in temperature of up to 2.8°C for any of the three baseline periods measured as a 10-year running average.

The Implementing Entity's response to the changed circumstance of global climate change will vary by the character and magnitude of the physical and biological changes observed. Responses may include those listed below. All responses will occur within one year of identifying changed circumstances, unless the Wildlife Agencies concur on a case-by-case basis that specific remedial actions would require more time to initiate.

<sup>4</sup> [http://www.climatechange.ca.gov/climate\\_action\\_team/index.html](http://www.climatechange.ca.gov/climate_action_team/index.html)

- Enhanced monitoring to detect ecological responses to climate change (see Chapter 7).
- Identification of target species most vulnerable to climate change and increased status-and-trend monitoring for those species.
- Alterations to the conceptual ecological models for natural communities and covered species as a tool to devise improved management actions (see Chapter 7).
- Altered or more intensive management actions on target/vulnerable species to facilitate shifts in species distribution (e.g., more active population management of covered species).
- More aggressive control of invasive species that respond positively to climate change.
- Implement other measures through the Adaptive Management Program (see Chapter 7) in ways consistent with permit obligations and with the consent of the Implementing Entity.

Thresholds for events that are not reasonably foreseeable have been established for determining unforeseen circumstances. Unforeseen circumstances not funded by the Plan include the following.

- A temperature increase greater than 2.8°C will be considered an unforeseen circumstance. Temperature increases will be measured for the three baseline periods measured as a 10-year running average.

Limits on the variation in other parameters (e.g., rainfall) are much more difficult to determine. Given the seasonality of rainfall in the study area, an increase in winter precipitation may be offset by increased evapotranspiration during the summer months (Intergovernmental Panel on Climate Change 2007). A decrease in winter precipitation would be exacerbated by increased summer temperatures, leading to increased drought. Therefore, it is not possible at this time to define limits of rainfall patterns that would qualify as unforeseen circumstances. Regardless of increases or decreases in precipitation, it is anticipated that the number of strong storm events would increase during the winter season (Kim 2005). These events are more likely to result in flooding than in increased soil percolation or water storage recharge (California Natural Resources Agency 2009). Increased frequencies of flooding and drought are taken into account in the sections below addressing these changed circumstances.

## Fire

Fire is a natural component of many ecosystems and natural community types, including grasslands, chaparral/northern coastal scrub, oak woodlands, and conifer woodlands. For each of these natural communities, fire frequency and intensity influence community regeneration, composition, and extent. To ensure that fire-dependent natural community processes occur, minimum suppression techniques and prescribed burning will be implemented as part of the Conservation Strategy (e.g., see Conservation Action LM-8 in Chapter 5).

However, it is possible that large, intense, and frequent fires could have a negative impact on natural communities and restoration projects. For example, more frequent, intense fires caused by high fuel loads and increased encroachment by woody species into grasslands could negatively affect community composition by favoring early successional species. Additionally, frequent, intense fires could cause *type conversion*, increasing the extent of certain natural communities, such as grassland, at the expense of others, such as chaparral or oak woodlands.

To determine the limits of changed circumstances, the size of catastrophic fires (e.g., fires over 10,000 acres) and their frequency (i.e., return interval) was assessed for the study area. This assessment was based on both historic fire occurrence and the influence of climate change. These conservative estimates for the study area were then scaled down to fit the Reserve System.

Using a conservative estimate, the total amount of land cover within the study area that is prone to wildfires is approximately 298,016 acres. Land cover types that are not prone to wildfire (i.e., low fuel loads, high moisture content) are riparian, wetland, agriculture, and developed land cover types and were subtracted from this total. Livestock foraging and grazing land is classified as grassland under the Plan; therefore, it is included as a land cover prone to wildfires.

Within the study area, regardless of size, wildfires occur at the average rate of once every 2 years (**Figure 10-1**). CAL FIRE has rated the fire probability in undeveloped portions of the study area as moderate to high. Recent fire history<sup>5</sup> for large fires (>100 acres) indicates that there have been 35 large fires since 1951 years. Large fires ranged from 134 acres to 5,813 acres. Of these, none were over 10,000 acres (i.e., catastrophic fires)<sup>6</sup>. There were four fires that occurred either partly within the study area or immediately adjacent to the study area (e.g., in State Parks lands) that were over 10,000 acres. These fires burned a total of 112,242 acres, or 38% of the land cover types prone to wildfire (also referred to as “burnable land cover”).

Climate change must also be taken into account when predicting fire frequency in the study area. Throughout California, fire occurrence can be correlated with drought, moisture availability, and biomass (fuel) accumulation (Lenihan et al. 2003). Both “wetter and warmer” and “drier and warmer” climate change scenarios are predicted for the study area (Hayhoe et al. 2004). The warmer, drier scenario would increase the occurrence of drought, while increased biomass production would result from the warmer, wetter scenario. Both of these scenarios have the potential to increase fire frequency due to either increase drought frequency or increase in biomass accumulation. For the purposes of the calculation of changed and unforeseen circumstance, it is assumed that fire frequency will increase in the study area due to climate change.

<sup>5</sup> Calculations were based on data from 1956–2011.

<sup>6</sup> Catastrophic fires occurred as follows: 32,866 acres in 1961 (Bollinger Ridge), 13,128 acres in 1985 (Lexington), 18,500 acres in 2003 (Annie), and 47,748 acres in 2007 (Lick).

With climate change, it is assumed that fire occurrence frequency and area burned will increase by 25%. Recent literature analyzing the relationship between climate change and fire frequency in California identified a median fire occurrence and burned area increase of 30% by 2050 (Westerling et al 2009). This is a statewide estimate with fire occurrence increases ranging from 11% to 55% and burned area increases ranging from 11% to 70%. The largest increases for both fire occurrence and burned area are expected to occur in the Sierra Nevada, Northern California Coast and south Cascade Ranges. These increases are expected to occur by 2050.

The potential effects of climate change on fire frequency are anticipated to increase over the course of the permit term. At the beginning of the permit term, limited change from historic fire occurrences and burned area may be acceptable as a changed circumstance; however, the potential effects of climate change will grow over the permit term. In addition, at the beginning of the permit term, fire risks in Reserve System will be low because it will be smaller. As such, it is felt that a 25% increase due to climate change represents a conservative estimate for the increase in fire frequency and burned area in the Plan area for the duration of the permit term.

Based on historic fires in the study area, it is foreseeable that four catastrophic fires could occur during the permit term, each burning 4 to 14% of the land cover types prone to wildfire within the study area. Increasing these values by 25% ( $0.04 * 1.25$  and  $0.14 * 1.25$ ) to take climate change into account, the Plan anticipates up to five catastrophic fires within the study area over the course of the permit term each burning approximately 5 to 17% of the land cover types in the study area prone to wildfires (14,901 to 50,663 acres, respectively).

It is assumed that 46,141 acres within the Reserve System is burnable land cover. This includes all of the burnable land cover within lands newly acquired for the Reserve System (32,850 acres; see **Table 5-11**) plus all existing open space lands incorporated into the Reserve System (up to 13,291 acres; see **Table 5-5**). To be conservative, it is assumed that all of the land cover in existing open space is prone to wildfires, even though a portion is expected to be developed, aquatic, and riparian land cover types that are not prone to wildfires. The Reserve System represents 15% of the burnable land cover in the study area. The Reserve System will be composed of large blocks of habitat that will build off existing open space within the study area. Based on the expected reserve design, it is assumed that any one Reserve System unit will not exceed 20,000 acres. (Reserve units will be composed of Reserve System lands with similar management and monitoring needs.) Although managed similarly, these lands will not necessarily be contiguous (e.g., Coyote Ridge and Tulare Hill are anticipated to be located within the same Reserve unit, even though they are not contiguous). The largest block of contiguous parcels within any reserve unit will not exceed approximately 10,000 acres. Because the reserve system is distributed over a large geographic portion of the county, it is extremely unlikely that a single fire, even if very large, could burn a significant portion of the entire reserve unit.

For the purpose of assessing changed circumstances, this 15% is applied to anticipate fire occurrence within the Reserve System and enhanced lands.

Fifteen percent was chosen because the Reserve System represents 15% of the flammable land cover in the study area. It is assumed that only 15% of the catastrophic fires (one fire) will burn a portion of the Reserve System and enhanced lands. This one catastrophic fire would affect the same proportion of the burnable acreage of the study area as each of the five catastrophic fires projected to occur in the study area (i.e., approximately 5 to 17% or 14,901 to 50,663 acres). This suggests that 2,235 to 7,599 acres are likely to burn<sup>7</sup> in the Reserve System as a result of catastrophic fire during the permit term. As such, it is foreseeable, as a changed circumstance, that up to one fire burning 2,235 to 7,599 acres of the Reserve System could occur over the course of the permit term. A total acreage burned from a catastrophic fire exceeding 7,599 acres (16% of the Reserve System burnable land cover) within the Reserve System is highly unlikely and is not reasonably foreseeable, therefore would be considered an unforeseen event. Any number of fires, regardless of burned acreage in the Reserve System, will be remediated as a changed circumstance if enhancement, restoration or creation projects described in the conservation strategy are affected. However, remedial actions triggered by a single fire event that burns more than 7,599 acres of the Reserve System would be limited to enhancement, restoration and creation sites. The Implementing Entity would not be responsible for remediating all burned areas as a result of a fire or fires that exceed the thresholds described above.

The threshold of burned acreage in the Reserve System for the changed circumstance (7,599 acres) is a reasonable upper limit when compared to the largest fire in the County (Lick Fire, 47,748 acres) because of the differences between the expected configuration and location of the Reserve System and the location of this extreme fire event. First, the Lick Fire occurred at a higher elevation than the expected Reserve System where terrain is more rugged, drier, and supports greater fuel loads than the expected Reserve System. The elevation also contributed to the remoteness of the Lick Fire, which made it difficult to contain quickly. The Reserve System will occur in middle to lower elevations in the County that support relatively low fuel loads (e.g., a much greater proportion of annual grassland than chaparral) and with good access for fire crews. The fire size threshold also corresponds to the approximate upper limit of contiguous parcels in the Reserve System.

Fires that occur too frequently in the same area may result in type conversion of natural communities (e.g., from chaparral to grassland). The historic fire frequency for any given site in the study area, varies substantially among land cover types, location, and topography (**Table 10-2**) (Davis and Borchert 2006; Stuart and Stephens 2006; Willis 2006). Due to the varying fire return intervals, return intervals are broadly defined for the fire-prone natural community types within the study area. Pre-historic, historic, and current fire return intervals for each natural community did not provide significant support for defining changed

---

<sup>7</sup> Large catastrophic fires in the study area each burn 4 to 14% of the wildfire-prone land-cover types. These percentages were increased by 25% to take climate change into account. The increased percentages, 5% and 17%, were applied to the wildfire-prone land-cover types in the study area (298,016 acres) to determine the lower and upper limits of changed circumstances and the threshold at which circumstances would be considered unforeseen. 15% \* 14,901 acres = 2,235 acres. 15% \* 50,663 acres = 7,599 acres.

circumstances; rather the conceptual fire-return pattern classifications and expert opinion were used. For each natural community, remedial actions for changed circumstances will be applied up to the unforeseen threshold identified in **Table 10-2**. Remedial actions will be funded and carried out by the Implementing Entity when any number of fires, regardless of size, recur in the same area at intervals at or above the unforeseen circumstance thresholds identified in **Table 10-2**. Fire return intervals below the thresholds identified are considered unforeseen.

Fire potential in the study area is typically greatest in the months of June–September when dry vegetation co-occurs with low humidity. Generally, the vegetative communities within the Reserve System are adapted to a more frequent historic fire regime and would naturally recover from fire. Reserve unit management plans will include fire management and protection measures that will minimize the risk of damage to habitats and natural communities from abnormally frequent fire (normal fire frequency is described above). Preventative actions include those listed below.

- Create or redesign fuel breaks to limit fire spread.
- Consider the reintroduction of low-intensity prescribed fires to encourage fire-adapted plants and discourage non-fire-adapted invasive plants.
- Work with local fire agencies to improve fire-suppression preparedness and develop strategies to protect habitat during fire response.
- Incorporate public-awareness programs into reserve unit management plans. This includes public outreach to neighboring lands to minimize fire risk.

Should a wildfire take place, the Implementing Entity will follow protocols established in the reserve unit management plans and will work closely with local fire response crews to ensure that impacts on sensitive communities and covered species are minimized. This includes the identification and completion of appropriate post-fire restoration and rehabilitation responsibilities (see Chapter 5, Section 5.3.2 *Landscape Conservation and Management*). In addition, landscape-level monitoring will assess changes to land cover type, and natural community-level monitoring will assess the response of invasive plants as part of status and trends monitoring (see Chapter 7, Section 7.3.1 *Landscape-Level Actions*). In accordance with these conservation and monitoring actions, in the event of habitat loss, remedial measures shall take place to re-establish natural communities and covered plant populations lost to fire either to pre-fire conditions or as otherwise determined on a case-by-case basis.

Remedial measures apply to each of the episodes identified above. For example, if there was a grassland fire that burned 7,000 acres (meets the single event burned area criteria for changed circumstance) and a portion of the same area burned again in 15 years, remedial actions for both episodes would be funded. Remedial actions are listed below.

- Initiate a post-fire damage assessment within six months following the end of a fire in order to identify the appropriate post-fire restoration and rehabilitation actions.

- Initiate the appropriate actions, such as habitat restoration, invasive-species control and/or erosion control, in affected reserves to ensure the reestablishment of covered plants and other native vegetation through active or passive means, as appropriate, within one year post-fire.
- Implement measures through the Adaptive Management Program (see Chapter 7) in ways consistent with permit obligations and with the consent of the Implementing Entity.
- Ensure appropriate erosion control structures and applications (e.g., seeding) are in place prior to the next rainy season.

## Nonnative Species or Disease

Nonnative species and diseases currently occur in the study area and will be present in the Reserve System (e.g., bullfrogs, hybrid tiger salamanders). Additionally, there are nonnative species and diseases that exist in areas outside the study area that have the potential to spread into the study area and adversely affect the covered species and natural communities within the Reserve System. Due to the nature of invasive species and diseases, there is no unforeseen circumstance, only an upper limit to which changed circumstances will be funded. In other words, a new disease or invasive species spreading throughout the study area within the permit term is a foreseeable event. However, if a disease or nonnative species spread beyond the thresholds identified below, it would be considered a catastrophic event beyond the Plan scope and remedial actions to address it would not be required to be funded by the Implementing Entity.

The conservation strategy includes measures to reduce existing and prevent future infestations of nonnative invasive species and diseases (see Chapter 5, Section 5.3.2 *Landscape Conservation and Management*). The monitoring program will identify and map existing diseases and nonnative species in the Reserve System so that new ones can be identified quickly and a control or eradication plan can be put into place. However, it is possible that the following events could occur despite implementation of the conservation strategy and monitoring program.

- New and aggressive nonnative species could invade the Reserve System.
- Infestations of a new disease that affects covered or predominant species in the study area (e.g., Sudden Oak Death) could have dramatic effects on the Reserve System.
- Existing nonnative species or diseases could expand to unprecedented levels in the Reserve System, perhaps due to changing climate.

Under the Plan, the following are considered changed circumstances for which remedial measures will be funded.

- Infestations of new diseases or new nonnative invasive species affecting up to 25% of the extent (i.e., acres) of a predominant natural community (i.e.,

oak woodland) or occupied covered species habitat within the Reserve System in any given year<sup>8</sup>.

- Spread of nonnative species or diseases existing on up to 25% above current conditions within the Reserve System in any given year.

The Reserve System builds off of existing open space in the study area, targeting specific natural communities and species habitat across a range of environmental gradients in geographically distinct areas (i.e., Santa Cruz Mountains, valley floor, Diablo Range). Diseases and nonnative species could spread into the study area from lands adjacent to the study area. It is foreseeable that a single disease or invasive species would spread across the entire Reserve System even if the Habitat Plan and remedial measures are properly implemented. Such an event would be catastrophic and likely no effort by the Implementing Entity alone would be able to stop its spread. Therefore, if remedial measure implementation does not prevent the spread of the nonnative species or disease beyond the established thresholds, it would be considered a catastrophic event.

To ensure that remedial actions are implemented aggressively before the thresholds are reached, the Implementing Entity must demonstrate in writing to the Wildlife Agencies the following in order to justify cessation or reduction of remedial actions once the thresholds are crossed:

- The changed circumstance was detected as soon as feasible and the Wildlife Agencies were notified.
- The Implementing Entity coordinated and worked actively with the Wildlife Agencies and other land managers to assess the changed circumstance and determine the best course of action.
- The Implementing Entity implemented remedial measures for the changed circumstance according to the Plan but these measures failed to stop the spread of the disease or invasive species.
- The disease or invasive species is a serious problem outside the Reserve System in the study area and similar control measures implemented by others also failed to control their spread.

Based on current knowledge of likely diseases and nonnative species, disease spread at catastrophic levels is only reasonably likely in the study area for Sudden Oak Death. For other known diseases or nonnative species, the remedial measure thresholds are assumed to be sufficient.

Sudden Oak Death is not currently found in the study area; however it is found in adjacent Santa Cruz County<sup>9</sup>. This disease spreads rapidly and could spread into the Reserve System and affect more than 25% of the oak woodlands despite

<sup>8</sup> The Reserve System will be assembled for the majority of the permit term. All creation and restoration activities must be completed by Year 40 and all preservation must occur by Year 45. The Implementing Entity will monitor current levels of disease and nonnatives relative to the current composition of the Reserve System each monitoring year.

<sup>9</sup> In addition, Santa Clara County is a quarantine county for Sudden Oak Death under U.S. Department of Agriculture and California Department of Food Agriculture regulations.

implementation of the conservation strategy, adaptive management, and remedial measures. If this occurred, the spread of the disease would not be limited to the Reserve System and would affect the natural community at the landscape scale. If Sudden Oak Death spread beyond 25% it would be considered a catastrophic event. In contrast, in the case of bullfrogs, an existing nonnative species, it is not reasonably foreseeable that the species would spread to an additional 25% of aquatic communities (from baseline levels) in the Reserve System. Bullfrogs are expected to be controlled in the Reserve System through proper implementation of the conservation strategy and adaptive management program (which includes a major component of bullfrog eradication and control) and proper implementation of remedial measures, if needed. The spread of diseases or invasive species in excess of 25% above baseline conditions is foreseeable for Sudden Oak Death and may be foreseeable for other diseases not currently known. However, because these events are considered catastrophic, the Implementing Entity would only fund remedial actions for these circumstances up to the 25% thresholds identified above (for Sudden Oak Death or other diseases or invasive species).

There are a number of diseases and nonnative species that may harm covered species and the natural communities on which they depend. Diseases that may threaten covered species in the study area include chytrid fungus, which could affect foothill yellow-legged frog, California red-legged frog, and California tiger salamander (U.S. Fish and Wildlife Service 2002; 69 Federal Register 48570–48649), and possibly rana viruses, which could affect California tiger salamander (69 Federal Register 48570–48649). It is unknown whether these diseases are a problem for populations in the study area due to a lack of surveys. In general, the effects of diseases on the survival and reproduction of covered species is poorly known. The method of measurement of the extent of new diseases will be different for each disease (e.g., number of trees affected, proportion of species' range, number of populations).

Diseases that may affect or threaten natural communities include Sudden Oak Death. Although not currently in the study area, Sudden Oak Death has been confirmed in San Mateo, Santa Cruz, Alameda, and Contra Costa Counties, and portions of Santa Clara County outside the study area; consequently, there is a high likelihood for it to spread into the study area during the permit term. Spread of this disease in the study area could lead to change in species composition, type conversion, and an increased risk of fire due to standing dead trees.

The list of nonnative plants and animals is much more extensive. They include but are not limited to invasive mussels, bullfrogs, nonnative pigs, and introduced predatory fish. These species currently occur in the study area, and conservation and monitoring actions to reduce or contain their occurrence within the study area have been developed.

When a new disease or nonnative species is detected or an existing disease or nonnative species begins to spread aggressively, the Implementing Entity will contact the Wildlife Agencies to collaboratively determine the best method of measuring, monitoring, and eradicating or controlling the disease before it

spreads<sup>10</sup>. Remedial measures that address the invasion of nonnative species or disease follow the steps listed below.

- Determine the best method for measurement and tracking extent within 3 months of detection.
- Prepare a damage-assessment report within 6 months of detection.
- Recommend and plan actions to address the threat within 6 months of detection.
- Respond through adaptive management in ways consistent with permit obligations and with the consent of the Wildlife Agencies within one year of detection.

## Flooding

Flooding is a natural event in stream systems, having both beneficial and detrimental effects on natural communities. Beneficial effects include limited scouring and thinning of homogeneous stands of riparian vegetation. However, detrimental effects of floods along stream channels with new riparian plantings could include destruction of enhanced or restored sites and created covered plant populations. This would require substantial remediation.

Major floods are defined as flood events that exceed the stream's capacity (i.e., 10-year flood event). Several major floods have been documented since European settlement in Santa Clara County, most recently in 1967, 1978, 1980, 1982, 1983, 1986, 1995, 1996–1997, and 1998. Flooding probability is specific to each stream's capacity, the runoff potential of the stream's upper catchment, and rainfall patterns across the county. Given that urbanization has increased across the county (increasing flood potential) and that local agencies have completed and continue to develop flood control projects to accommodate increased peak runoff (decreasing flood potential), past flood events do not reliably predict future flood probability.

In most cases several major floods occur within a given year in multiple watersheds. For example, a particularly wet year allows for increase rainfall throughout the County. Extended periods of high rainfall cause soil saturation. Factors such as stream capacity and runoff potential also increase the likelihood of flooding throughout the study area increases. This allows for multiple events to occur in a given year.

Taking into account climate change, we must rely on predictive models in addition to historic trends. Climate change models typically focus on the occurrence of 100-year flood events. While there is a discrepancy over whether precipitation will increase or decrease in the study area, it is expected that storms

<sup>10</sup> A recent example of such a situation was the discovery in 2000 of barbed goat grass on Coyote Ridge, a highly invasive plant not previously known in that area. Local biologists and land managers coordinated with the Wildlife Agencies on appropriate rapid responses to the threat. After trying several techniques and applying the most effective techniques over multiple years, by 2008 the infestations were nearly eradicated (S. Weiss pers. comm.).

at or below the 100-year event are reasonably likely within the permit term and could potentially increase in frequency in the county due to climate change (Hayhoe et al. 2004; Kim 2005; California Natural Resources Agency 2009). The 100-year flood (i.e., one-percent flood) is defined as the flood event that has a 1% probability of occurrence in any given year. Over a very long period of time, it is the flood event that would, on average, occur once per hundred years; however, over a short time span, it can occur more than once in a single year or not at all for several hundred years. For example, a one-year storm event has a 100%, approximately, probability of recurring each year. This does not mean that a 1-year event will happen every year; however it is highly likely to happen each year. A 100-year storm event has a 1% probability of recurring each year.

The 100-year flood event for an individual creek or reach of creek is expressed as a “Q” or flow rate. The “Q” can be modeled, and/or estimated by using a variety of data sets. The estimated “Q” or flow rate for a given storm event (i.e., 1-year, 10-year, 50-year, 100-year) will be as accurate as the data set you are using to estimate it. While the 100-year flow rates are available for the streams in the Plan Area, they are not a good indicator of flood event intensity and frequency for assessing changed circumstances.

Climate change models also demonstrate clear trends towards earlier snowmelt accompanied by increased frequency of winter flooding (Dettinger et al. 2004). These climate-change predictions are most likely to impact the study area later in the permit term, if at all, as the models predict more drastic hydrologic changes for the end of the century compared to mid-century. The flood-control standard for local agencies is the 100-year event. As such, these climate change driven hydrologic changes, along with changes from increased urbanization, are being taken into account by the SCWVD in flood control project design. Consequentially, climate change is not anticipated to have an effect on flood event intensity and frequency.

Major flood events could occur in the study area during the permit term and are therefore considered changed circumstances. Historically, most major flood damage occurred on the valley floor, away from almost all of the areas anticipated to be incorporated into the Reserve System, which will be located mostly in the lower to middle elevations. Portions of the Reserve System most susceptible to flooding would occur in lower elevations. The dams in these watersheds do not play a significant role in flood control (i.e., Pacheco Dam). Flooding may also be possible in the Reserve System in lower reaches of Uvas or Llagas Creek. Regardless of location, remedial measures will be implemented for all flood events that damage or destroy enhancement projects, restoration projects, creation projects, or in-stream conservation structures, so that success criteria can be met and compliance credit maintained. Thresholds for flood events that are not reasonably foreseeable have not been established for determining unforeseen circumstances.

Following a flood event, the site will be evaluated to determine appropriate corrective actions necessary to restore the habitat through active management or natural processes. Remedial actions (i.e., grading, new riparian plantings, debris

removal, covered plant restoration, etc.) will be implemented within a time period to maintain permit compliance with the Stay-Ahead provision for restoration, creation, and enhancement (see Chapter 8). Measures shall be implemented through the adaptive management program (see Chapter 7). The Implementing Entity will have the option of implementing remedial actions on site or in-kind. For example, if the cost to rebuild an enhancement, restoration or creation project exceeds the cost of constructing a new project, the Implementing Entity will have the option of constructing a new project elsewhere within the Reserve System of equivalent or greater biological value.

## Drought

Drought is a natural part of a Mediterranean climate system to which species and natural communities have adapted. However, a prolonged drought could cause serious damage to the Reserve System, especially to new restoration plantings and enhanced or created populations of covered plants that have yet to become established. The following analysis was conducted to define droughts and estimate their expected frequency of occurrence in the study area. Droughts that occur within this expected frequency are considered a changed circumstance and are expected and funded over the course of Plan implementation; droughts outside this frequency are considered unforeseen.

To estimate how many drought years might be expected during the permit term, annual natural reservoir inflow (i.e., inflow from local precipitation, not imported water) within the study area was reviewed from 2010 back to 1925 by water year (July 1 to June 30). A drought is defined as two or more successive water years with 75% or less of the median inflow. These data show that droughts lasting 2 to 6 years occurred 4.2 times over any 50-year period. Of these droughts, only a single event lasted 6 years. A predictive study determined that droughts of 6 years are expected to occur two to three times in 100 years based on historic information (Dean et al. 1994). It is assumed that a drought of three or more years in length has an approximately 60% chance of occurring. While climate change is anticipated to result in increased drought potential, the extent of such change is not fully understood. Thus, the predicted drought potential during the permit term is conservative.

Based on historic data and conservative application of climate change predictions, remedial actions will be funded by the Plan for up to seven droughts, each one to eight years in duration, occurring during the permit term. Of the seven droughts, only one is anticipated to be eight years in duration. More than seven droughts during the permit term, more than a single drought of eight years, and any number of droughts exceeding eight years in duration each are considered unforeseen circumstances and not funded by the Plan.

The monitoring and adaptive management program includes monitoring of enhancement, restoration and creation sites. This will minimize the risk of losing mitigation plantings and restored habitats due to drought. Preventative measures will be included in the monitoring program (Chapter 7, Section 7.3.2 *Natural Community-Level Actions*) and are listed below.

- Monitor SCVWD natural reservoir inflow data in the study area to determine if the seasonal inflow at the end of April indicates a dry year (near 75% of inflow).
- Monitor mitigation sites that are beyond their establishment periods (i.e., no longer sustained by irrigation) but that have not achieved their success criteria for stress due to low soil moisture or high evapotranspiration rates.
- Extend preventative measures (e.g., longer-term supplemental irrigation) as necessary for enhancement, restoration, or creation projects that have not achieved their success criteria to prevent damage or losses due to drought and to assure success rates of the projects.

Should damage or losses due to drought occur, the Implementing Entity will assess the drought damage and initiate the following remedial measures within one year of damage or loss.

- Prepare damage assessment report.
- Identify actions to improve effects on covered species (e.g., provision of temporary artificial water sources).
- Identify actions to improve effects on enhanced, restored, or created habitats that have not achieved their success criteria (e.g., supplemental irrigation).
- Implement measures through the Adaptive Management Program (see Chapter 7) in ways consistent with permit obligations and with the consent of the Implementing Entity.

## Earthquakes

Earthquakes of less than 4.0 on the Richter scale (defined as “micro” or “minor” earthquakes by the USGS) occur frequently in the study area and their effects on natural communities and covered species are expected to be very small or undetectable. While less common, earthquakes defined as “light” (magnitude 4.0 to 4.9) or “moderate” (5.0 to 5.9) are expected to have little to no effect on covered species or natural communities<sup>11</sup>. However, these earthquakes may be large enough to cause moderate ground shaking which may trigger small to moderate-sized landslides. These landslides are a natural part of the ecosystems in the study area. Damage to Reserve System facilities from such light to moderate earthquakes is expected to be low to none.

A large, catastrophic earthquake is typically defined in planning documents and engineering projects as having a magnitude equal to or greater than 6.7<sup>12</sup>. This magnitude earthquake has the potential to occur during the permit term in or near the study area. The USGS predicts that an earthquake of magnitude 6.7 or greater has a 7% chance of occurring by 2036 on the Calaveras Fault, which extends down the eastern side of the study area in the foothills of the Diablo

<sup>11</sup> Earthquakes of magnitude 6.0 to 6.6 are not specifically defined by the USGS.

<sup>12</sup> Source: <<http://earthquake.usgs.gov/regional/nca/wg02/index.php>>. For reference, the Northridge earthquake of 1994 was a magnitude 6.7.

Range<sup>13</sup>. The Hayward Fault to the north of the study area has a 31% chance of an earthquake of this magnitude by 2036. The San Andreas Fault, which runs down the western side of the study area through the Santa Cruz Mountains, has a 21% chance of a similar event. Earthquakes of every magnitude described above could occur in or near the study area during the permit term and are therefore considered changed circumstances.

The negative effects of a catastrophic earthquake are likely to manifest mostly as damage to infrastructure (i.e., fencing, bridges, buildings, temporary irrigation) rather than to natural communities or species. Should any earthquake occur, the Implementing Entity will rebuild Reserve System infrastructure and conduct *post hoc* monitoring of species or populations that are identified as being potentially negatively affected by the incident. Reserve System infrastructure will be repaired or rebuilt within two years. Remediation of enhancement, creation, and restoration sites within the Reserve System affected by earthquakes during the permit term (i.e., as a result of landslides) would be remediated within two years of the earthquake. Site-specific covered species and natural community monitoring will be conducted for three years after the event if covered species or their habitats are adversely affected.

Damage to Reserve System infrastructure, natural communities, and covered species from any earthquake will be remediated by the Implementing Entity.

## 10.2.2 Federal No Surprises

The federal *No Surprises Regulation* was established by the Secretary of the Interior on March 25, 1998. It provides assurances to Section 10 permit holders that no additional money, commitments, or restrictions of land or water will be required should unforeseen circumstances requiring additional mitigation arise once the permit is in place. The No Surprises Regulation states that if a Permittee is properly implementing an HCP that has been approved by USFWS and/or NMFS, no additional commitment of resources, beyond that already specified in the plan, will be required.

The Permittees request regulatory assurances (No Surprises) for all covered species in the Plan. In accordance with No Surprises, the Permittees will be responsible for implementing and funding remedial measures in response to any changed circumstances as described in this chapter. The Permittees will not be obligated to address unforeseen circumstances but will work with the Wildlife Agencies to address them within the funding and other constraints of the Plan should they occur.

The Permittees understand that No Surprises assurances are contingent on the proper implementation of the permits, Implementation Agreement, and Habitat Plan. The Permittees also understand that USFWS may suspend or revoke the federal permit, in whole or in part, in accordance with federal regulations

<sup>13</sup> Source: <<http://earthquake.usgs.gov/regional/nca/ucerf/>>. The Calaveras Fault runs immediately east of Coyote Ridge in a line traced by the locations of Anderson, Coyote, and Calaveras Reservoirs.

(50 CFR Section 13.27 and 13.28 and other applicable laws and regulations) in force at the time of such suspension.

### 10.2.3 Federal Section 7 Consultations

An important goal of the Plan is to provide a framework for ESA compliance for covered species for all covered activities in the study area. Whether a covered activity occurs under Section 7 or 10 of the ESA, the Habitat Plan will provide the framework for future Section 7 consultations. For some future projects, ESA consultation (through Section 7) will still be required even after the Plan is complete (e.g., SCVWD flood control projects or private development projects that require a Corps wetlands permit). As such, the consultation process must be taken into account when developing a project timeline.

Projects that are subject to Section 7 of the ESA are evaluated under different standards than projects subject to Section 10. Non-federal projects must obtain a permit for take of listed species, while federal agencies must consult with USFWS or NMFS whenever their actions have the potential to affect a listed species. For example, the definition of “affect” differs slightly from that of “take” and may be applied differently, depending on the species and the project.

The Habitat Plan is not intended to alter the obligation of another federal agency to consult USFWS or NMFS pursuant to Section 7 of the ESA. Unless otherwise required by law or regulation, USFWS will ensure that biological opinions issued for projects that are defined as covered activities under the Habitat Plan are consistent with the biological opinion issued for the Habitat Plan and the federal permit. Section 7 consultations only apply to federally listed species, so only those covered species that are federally listed at the time of the consultation need be included in the consultation. Unless otherwise required by law or regulation, USFWS will not impose measures on applicants for coverage under the Habitat Plan in excess of those that have been or will be required by the Implementing Agreement, the Habitat Plan, and the permits. Before completing a Section 7 consultation for a covered activity in which USFWS proposes to require a measure in excess of the requirements of the Implementing Agreement, the Habitat Plan, or the permits, USFWS will meet and confer with the Permittee with jurisdiction over the affected project to discuss alternatives to the imposition of the measures that would meet the applicable legal or regulatory requirements. No Surprises assurances cannot be provided to federal agencies through the Section 7 process (50 CFR Section 17.22(b)(5)). USFWS will process subsequent ESA consultations for covered activities in accordance with the established regulatory process and deadlines (50 CFR Section 402.14).

### 10.2.4 State NCCP Assurances

The NCCP Act (Section 2820[f]) includes provisions ensuring that “if there are unforeseen circumstances, additional land, water, or financial compensation or restrictions on the use of land, water, or other natural resources shall not be

required without the consent of the plan participants...” The NCCPA specifies that assurances for plan participants may be provided commensurate with long-term conservation assurances and associated implementation measures provided in the Habitat Plan. CDFG’s determination of the level of assurances and the time limits specified in the Implementing Agreement will be based on the overall knowledge of the species and natural communities, the strength of the conservation strategy, and the size and duration of the Habitat Plan (Sections 2820[f][1][A–H]).

The Permittees understand that No Surprises assurances are contingent on full implementation of the Habitat Plan. The Permittees also understand that CDFG may suspend the state permit, in whole or in part, in the event of any material violation of the state permit or material breach of the Implementing Agreement by the Permittees. See the Implementing Agreement Section 16 for additional information on permit suspension including steps that must be followed prior to permit suspension.

## **10.2.5 Conservation Contributions by State and Federal Agencies**

It is anticipated that state and federal agencies, including the Wildlife Agencies, will contribute to the conservation portion of the Plan. The Permittees recognize that state and federal funds cannot be guaranteed in advance of the approval of yearly budgets, nor can they be guaranteed by agency staff who do not have the authority to commit these funds. However, the Permittees seek assurance that the Wildlife Agencies will make every effort to assist the Implementing Entity in securing the funding outlined in Chapter 9 to contribute to species recovery and to help implement the conservation portion of the Habitat Plan.

## **10.2.6 Staff Contributions by State and Federal Agencies**

Successful implementation of the Habitat Plan relies on the continued participation and feedback of representatives of the Wildlife Agencies. As described in Chapter 8, Wildlife Agency staff are expected to participate in Implementing Entity meetings and subcommittees as needed to evaluate and provide advice and applicable consent on Plan implementation. In particular, Wildlife Agency staff participation is critical to the success of the adaptive management and monitoring program. The Permittees request that the Wildlife Agencies make every effort, given budget and workload constraints, to provide staff to serve on all appropriate committees and participate in discussions and meetings to ensure that the implementation of the Habitat Plan is consistent with any findings upon which the permits are based.

## 10.2.7 Assurances for Private Landowners

### Take Authorization Assurances

Project proponents will receive take authorization for covered activities according to the procedures and requirements described in the Plan (see Chapter 6, Section 6.3 *Conditions on All Covered Activities* and Chapter 8, Section 8.7 *Roles and Responsibilities in Reviewing Applications for Take Authorization*). Take authorization is granted under a single non-severable permit. If the USFWS or CDFG suspend or revoke their permit, take authorization provided to those under the jurisdiction of the Permittees would also be suspended or revoked. As such, for projects conducted by private developers under the jurisdiction of one of the Permittees, take authorization will remain in effect for that covered activity unless one or more of the permits issued by the Wildlife Agencies to the Permittees are suspended or revoked. In addition, if a local jurisdiction determines that one of its project proponents is in violation of their permit (i.e., in violation of the conditions in Chapter 6), the local jurisdiction will suspend or revoke take coverage extended to the project proponent and report the violation to the Implementing Entity. The Implementing Entity will report the violation to the Wildlife Agencies immediately.

### Neighboring Landowner Assurances

This Habitat Plan calls for the acquisition of land and coordinated management of a Reserve System for the benefit of covered species. As a result of the conservation strategy (Chapter 5), some populations of listed species are expected to increase in the reserves and elsewhere. Landowners adjacent to or near reserves may be concerned that populations of state- or federally listed species in the reserves may expand and colonize or use their lands, potentially restricting their land use activities. The Neighboring Landowner assurances included in this Plan are designed to address these concerns.

Active private ranches, cropland, pasture, orchards, and vineyards are the most abundant land uses in Santa Clara County outside of the urban centers. These are the land uses that are also most likely to occur adjacent to reserve lands. Land uses outside urban areas that are most likely to be affected by the presence or increased abundance of covered species are limited to actively farmed lands such as crops, pasture, orchards, or vineyards in which heavy equipment is used regularly and the soil is regularly disturbed. Routine ranching activities (e.g., livestock grazing on annual grassland) are not expected to be affected by the maintenance or increase of populations of covered species on nearby reserve lands. Most routine ranching activities have little or no adverse impact on the terrestrial covered species and in some cases may benefit them<sup>14</sup>. Other land uses (e.g., urban development) are excluded from Neighboring Landowner protections

<sup>14</sup> Special federal rules (called “4(d) rules”) exempt defined routine ranching activities from take prohibitions of California red-legged frog and California tiger salamander.

because ongoing take of covered species is not expected to occur within these areas.

Neighboring Landowner Assurances are extended to certain “farmlands” as defined below. For purposes of the Neighboring Landowner Agreement program, *farmlands* means lands on which normal agricultural practices including but not limited to crop planting and production, irrigation and fertilization, soil tilling, crop harvesting, grazing including intensive livestock grazing, forage production, animal production and husbandry, and other associated activities such as fence construction and maintenance, vehicle or horse use, and construction and maintenance of typical farm outbuildings.

Take coverage for this program is limited to three covered species: California red-legged frog, California tiger salamander, and western pond turtle. By providing Neighboring Landowner Assurances, the Habitat Plan acknowledges that successful implementation of the conservation strategy (e.g., specific management actions that benefit species) may cause the three species listed above to become established on or use nearby private lands. Take coverage afforded by Neighboring Landowner Assurances could result in a diminution of the benefits of the conservation strategy for these three species in instances where species expand or increase their populations within the study area. Neighboring Landowner Assurances do not provide for take of existing populations at the time baseline conditions are documented. Accordingly, this program would not reduce these populations or habitat from baseline conditions. In addition, these assurances end when the permit term expires.

Neighboring Landowner Assurances provide incidental take coverage for California red-legged frog, California tiger salamander, and western pond turtle on all private farmlands, within 1.0 mile of the boundary of any land or property acquired or placed under easement by the Implementing Entity or by another organization in partnership with the Implementing Entity for the Reserve System. A one mile buffer was determined to account for the most likely dispersal distances of California tiger salamander and California red-legged frog (e.g., dispersal distance of from breeding habitat into upland habitat). Covered species are expected to disperse or move more than 1.0 mile but this radius accounts for the most likely area of effect into neighboring lands.

Once land acquisition is complete (by Year 45 of the Plan), the lands eligible for these assurances are estimated at 20,395 acres (4% of the study area) if all lands currently in agricultural use remain in agricultural use. The impact analysis assumes that total of 8,018 acres of cultivated agricultural land in the study area will be removed by covered activities (**Table 4-2**). Applying this assumption reduces the estimated eligible land to 12,377 acres (2% of the study area) by the end of the permit term. Because the actual pattern of agricultural land conversion is difficult to predict, these two values represent a likely range of eligible land (rounded to 12,400 acres to 20,400 acres). Modeled habitat for the three species is found on these sites, but mostly for secondary or dispersal habitat, not breeding habitat (**Table 10-3**). Modeled habitat for the three species also overlap with each other.

Privately held lands will be included in this Neighboring Landowner Assurances program through a voluntary application process. The neighboring landowner would apply to the Implementing Entity for coverage and the Implementing Entity would determine whether the lands in question qualified and, if they did, issue a *Certificate of Inclusion* for the property that will be signed by the landowner. The approach is required by the Wildlife Agencies to allow an affirmative statement be made by willing landowners to participate in the Habitat Plan. Those landowners that do not seek to participate will not be required to do so but will also not receive coverage for incidental take for their ongoing activities as a result of Habitat Plan conservation actions. Neighboring land agreements can only extend take coverage to eligible parcels or portions of parcels<sup>15</sup> within the permit area (i.e., not adjacent counties or portions of Santa Clara County that are outside of the permit area). Based on the landowner participation in other counties with approved HCPs that have similar programs (e.g., San Joaquin County), it is assumed that up to 10% of eligible lands will enter into neighboring land agreements, or no more than 1,240 to 2,040 acres.

The neighboring landowner protections listed below will be offered under the Plan according to the definitions and process defined below.

- Farmlands (as defined above) within 1.0 mile of reserve boundaries may be covered for incidental take of California red-legged frog, California tiger salamander, and western pond turtle authorized for take under the Habitat Plan's associated Section 10(a)(1)(B) and NCCP permits, should any such lands support increased use or become inhabited by these three covered species *after* establishment of a reserve parcel within 1.0 mile. Take coverage will not be provided for individuals or populations of these three covered species that inhabit the neighboring lands prior to the establishment of a reserve parcel, as identified in a baseline survey (see below).
- Coverage under the take permits will be offered to neighboring lands actively being used for farming purposes at the time that the reserve is established within 1.0 mile.
- *Actively being used for* means lands on which usual and customary agricultural practices are occurring, including normal crop rotation practices, at the time the neighboring reserve is established. For example, if agricultural lands that are used for crop production lie fallow in accordance with normal crop-rotation practices at the time the neighboring reserve is established, those lands would be considered to be actively used for farming purposes. Such coverage shall continue, subject to the terms and conditions of the Habitat Plan, the Implementing Agreement, and the take permits, for as long as the neighboring lands are actively being used for farming purposes and the permits remain in effect.
- Coverage will not be offered to neighboring lands devoted to non-farmland purposes at the time the nearby reserve is established. Take coverage does not include conversion of agriculture to other uses.

---

<sup>15</sup> Landowners with parcels that lie partly within the permit area or partly within the 1.0 mile eligible radius may enroll only that eligible portion of their parcel in the Neighboring Landowner Assurances program.

- A change in agricultural land cover as defined by the land cover types in this Habitat Plan (e.g., pasture to vineyard) would require landowners reapplying to the Implementing Entity for Neighboring Landowner Assurances in order to determine the new baseline condition of covered species on the affected property.
- Prior to receiving coverage under the permits, the environmental baseline must be determined. The baseline conditions on a site will be documented to define the type, number, location, and condition of California red-legged frog, California tiger salamander, and western pond turtle or their habitat present on the site prior to the acquisition or management of reserve lands within 1.0 mile of the site. The final baseline report will document the areas and resources of the neighboring parcel eligible for take authorization under this program. Landowners will have the option of either allowing biologists with the Implementing Entity to survey their property and reimbursing these costs, or hiring a biologist on their own that is approved by the Implementing Entity to do so. Survey costs associated with participation in this program are the responsibility of the landowner. Reports prepared by landowner consultants will be reviewed by the Implementing Entity for adequacy. Neighboring Landowner Assurances do not provide for take of existing populations and already occupied habitat of listed species (i.e., the baseline conditions). Accordingly, this program would not provide coverage for a decline in baseline conditions.
- The survey report will address the areas proposed for Neighboring Landowner protections and will include, at a minimum, a description of habitat for covered species (extent and quality), existing records of covered species within 1 mile of the parcel proposed for coverage, and the results of surveys for covered species on the parcel proposed for coverage. Upon receipt of a biological report approved by the Implementing Entity and a *Certificate of Inclusion* signed by the landowner, the Implementing Entity will grant take coverage to the landowner under this program.
- A change in ownership of land enrolled in the Neighboring Landowner Assurances program requires the new landowner to notify the Implementing Entity in order to continue coverage. This notification allows the Implementing Entity to verify that the new landowner wishes to continue to be enrolled in the program. No new surveys are required to continue coverage under the program, if agricultural land cover documented in the original Neighboring Landowner Agreement is maintained by the new owner. However, the new land owner would have to sign a Certificate of Inclusion for the property.

The Implementing Entity will maintain a record of all correspondence and certificates of inclusion sent to neighboring landowners subject to these protections, as well as signed certificates of inclusion returned by landowners. The Implementing Entity will notify the Wildlife Agencies of the number, location, and size of neighboring lands entered into the program in its annual report. Copies of the certificates will be provided to the Wildlife Agencies upon request. The location of all neighboring lands enrolled in the program will be mapped in the Implementing Entity's GIS database.

As the Reserve System grows, the Implementing Entity will include an outreach component to educate neighbors on how to continue their agricultural practices to minimize effects to species (and to benefit species) and inform land owners about the Neighboring Landowner Assurances program and provide ongoing education for those enrolled in the program.

## **Public Access to Conservation Easements Held by Private Landowners**

It is not the intent of the Implementing Entity to allow general public access on conservation easements that are part of the Habitat Plan Reserve System. Public access to private lands managed under the Habitat Plan could conflict with ongoing agricultural or other operations and could pose a safety risk to the public. Public access to lands under conservation easements could also pose a risk of unwanted trespass onto adjacent privately held lands. Generally, the Implementing Entity will leave decisions regarding public access up to the landowner but will restrict access through the conservation easement where that access may conflict with the conservation goals of the site (see Chapter 8, Section 8.6.3 *Conservation Easements*). All conservation easements will provide access for the Wildlife Agencies' and Implementing Entity's biologists to conduct management and biological monitoring necessary for compliance with the Habitat Plan's adaptive management and biological monitoring program.

## **10.3 Modifications to the Plan**

The Habitat Plan or incidental take permits can be modified in accordance with USFWS and CDFG regulations and the terms of the Implementing Agreement. Habitat Plan modifications are not anticipated on a regular basis. Modifications can be requested by a Permittee or by the permitting agencies. The categories of modification that are recognized, in order of significance, are administrative changes, minor modifications, and amendments, each of which is described below.

### **10.3.1 Administrative Changes**

Administrative changes are internal changes or corrections to the Plan that do not require preauthorization from the Wildlife Agencies. Administrative changes do not result in any changes to the impacts analysis, conservation strategy, or decision documents. Administrative changes will be made in writing and documented by the Implementing Entity. The Wildlife Agencies will be provided a summary of administrative changes in each annual report. Examples of administrative changes are listed below.

- Corrections of errors in the Plan that do not change the intended meaning or obligations.

- Day-to-day implementation decisions, such as modifying irrigation schedules for created/restored habitats on the basis of observed water needs of planted vegetation.
- Conducting additional monitoring surveys.
- Modifying Habitat Plan monitoring protocols to align with Wildlife Agency monitoring protocols as they may be modified in the future.
- Adopting new monitoring protocols that may be promulgated by the Wildlife Agencies in the future.
- Annual adjustments to the Habitat Plan development fee and wetland fees to keep pace with the inflation of land values.
- Changes to the membership of the Governing Board, Implementation Board, the Science Advisors, or any advisory committees to the Board without changing the representation of the Permittees, agencies, or organizations.

### 10.3.2 Minor Modification

Minor modifications to the Plan are changes that do not adversely affect the impact assessment or conservation strategy described in the Habitat Plan and do not adversely affect the ability of the Implementing Entity to achieve the conservation strategy commitments of the Habitat Plan. Minor modifications do not require an amendment to the permits or the Implementing Agreement, but they do require pre-approval by the Wildlife Agencies before being implemented. In addition, minor modifications do not change the scope or nature of the covered activities and do not trigger a new NEPA analysis. Examples of minor modifications are listed below.

- Updates to the land cover map or to species occurrence data that are consistent with the predictions and expectations of the Habitat Plan.
- Modifying the design of directed studies or implementing new studies.
- Minor changes to the biological goals or objectives in response to adaptive management.
- Minor changes to survey or monitoring protocols that are not proposed in response to adaptive management<sup>16</sup>.
- Modification of monitoring protocols for Habitat Plan effectiveness not in response to changes in standardized monitoring protocols from the Wildlife Agencies.
- Modification of existing or adoption of additional conservation measures that improve the likelihood of achieving covered species objectives.

---

<sup>16</sup> Such changes are subject to federal No Surprises regulations, state assurances, and local assurance provisions found in the Implementing Agreement.

- Discontinuation of ineffective conservation measures and adoption of new conservation measures that improve the likelihood of achieving the conservation strategy.
- Modification of existing or adoption of new performance indicators or standards if results of monitoring and research or new information, indicate that the initial performance indicators or standards need revision.
- Modification of existing or adoption of additional covered species or natural community objectives where such changes more effectively achieve covered species, natural community, and overall Habitat Plan goals.
- Modification of the conditions on covered activities in response to adaptive management.
- A minor change to the conservation strategy restoration/creation interim deadlines (**Table 5-14**) (e.g., extend a deadline by up to 2 years, if compliance has almost been accomplished and can be documented by the Implementing Entity).
- Minor changes to the reporting protocol.
- Other changes that do not result in adverse effects on covered species beyond those analyzed in the Habitat Plan and the associated biological opinion, and do not limit the ability of the Implementing Entity to achieve the biological goals and objectives of the Plan.

Changes in the land acquisition configuration of the Plan (see Chapter 5, Section 5.3.1 *Land Acquisition and Restoration Actions*) may be necessary to address changing land use patterns, such as rural development, in the study area or a lack of willing sellers in key Conservation Analysis Zones (Zone). Changes in land acquisition requirements within a Zone that amount to less than 5% of the original acreage are considered minor modifications as long as all three of the conditions listed below are met.

- The overall target acquisition acreage of land cover type or habitat for covered species does not change within the study area (i.e., a decrease in land acquisition on one Zone is balanced by an increase in land acquisition in another Zone).
- The changes between Zones are biologically equivalent or biologically superior to the original Plan.
- The changes do not affect the ability of the Implementing Entity to mitigate the impacts on covered species, contribute to the recovery of covered species, and meet the Plan's biological goals and objectives.

These are considered minor adjustments to account for willing sellers whose parcels span more than one Zone and may shift land cover between Zones while still meeting overall land cover requirements. A minor change in land acquisition configuration may be needed, for example, to account for small differences in acreages of land cover type across Zones due to parcel boundary changes or spanning across multiple Zones. In addition, this allowance is also important to account for limitations in the land cover mapping where a parcel

may contain important biological resources that were missed in the mapping but identified in the field. Finally, rural development occurring in one Zone may limit the acquisition opportunities of land cover types with limited occurrences within the Zone. This may make the same land cover type in an adjacent Zone a more attractive acquisition option. Any change in land acquisition requirements that exceeds 5% of the original acreage requirement or that is inconsistent with the criteria above is considered an amendment.

A change in the Habitat Plan study area (either a decrease or an increase) in response to a change in the planning limit of urban growth or city limit is also considered a minor modification, as long as the change meets the five conditions listed below.

- There is no change in the permit area.
- It is compatible with the conservation goals and Reserve System configuration of the Plan.
- It is consistent with the urban development covered activities in the Plan as defined in Chapter 2.
- It is consistent with the impact analysis of the Plan (Chapter 4).
- It addresses activities that are already covered by the Plan.

## **Minor Modification Process for Section 10(a)(1)(B) Permit**

Minor modifications to the federal permit may be proposed by one or more Permittees, the Implementing Entity, or the USFWS. While the USFWS does not have the right to amend its own permit unilaterally, they may propose minor modifications to the Permittees for consideration. Minor modifications shall take the form of a proposal that includes the following elements:

- Description of proposed minor modification.
- Rationale for proposed minor modification.
- Analysis of the environmental effects of the proposed minor modification, including impacts to covered species and implications for the conservation strategy.
- Description and declaration of how the proposed minor modification conforms to the conditions disclosed above (i.e., compatible with conservation goals) and the terms of the Plan as it was originally adopted.

All minor modifications must first be approved by the Implementing Entity Governing Board in a public meeting, and are subject to final approval by the Wildlife Agencies. To modify the Plan without amending the permits, the Implementing Entity Governing Board will submit to the Wildlife Agencies a written description of the proposed change and an explanation of why its effects are not believed to be significantly different from those described in the original Plan.

Upon receiving the proposal for a minor modification, the Wildlife Agencies may authorize the modification, request additional information, or deny the modification. If the Wildlife Agencies concur with the proposal, they will authorize the modification in writing, and the modification shall be considered effective on the date of the Wildlife Agencies' written authorization. If the Wildlife Agencies feel that the proposal lacks specific information, the Wildlife agencies may request additional information in order to authorize or deny the modification. If the Wildlife Agencies deny the modification, they will provide explanation for the denial.

The Wildlife Agencies will not approve minor modifications to the Plan if they determine that the modifications would result in adverse effects on covered species or natural communities that are significantly different from those analyzed in the Plan. If any Wildlife Agency denies a proposed modification, it may be proposed as an amendment as described below.

## **Minor Modification Process for NCCP Act Permit**

There is no established procedure to amend an NCCP Act permit through a minor modification. However, the minor modification process described above for the federal permit is proposed to also apply to the NCCP Act permit. The Implementing Entity will submit the same proposal to CDFG as to USFWS. CDFG will review the proposal and choose to accept the proposal, request additional information, deny the proposal, or require that the modification be processed as an amendment, as described below.

### **10.3.3 Amendments**

An amendment is a change in the Plan that may affect the impact analysis or conservation strategy in the Plan. Amendments to the Habitat Plan and the incidental take permits follow the same formal review process as the original Plan and permits, including NEPA/CEQA review, Federal Register notices, an internal Section 7 consultation with USFWS, and formal NCCP findings by CDFG. An internal Section 7 consultation with NMFS would be required if anadromous fish are added to the Plan. The Implementing Entity's Implementing Board will submit a proposed amendment to the Wildlife Agencies in a report that includes a description of the need for the amendment, an assessment of its impacts, and any alternatives by which the objectives of the proposal might be achieved.

Examples of changes that would require an amendment include but are not limited to those listed below.

- Revisions of the permit area boundary.
- Addition of species to the covered species list.

- Increasing the allowable take limit of existing covered activities or adding new covered activities to the Plan.
- Modifications of any important action or component of the conservation strategy under the Habitat Plan, including funding, that may substantially affect levels of authorized take, effects of the covered activities, or the nature or scope of the conservation program. This includes a reduction in the conservation strategy in the event that covered activities and fee funding do not occur as expected (see below for additional explanation).
- A major change to a conservation strategy milestone (e.g., extend a deadline beyond one or two years).
- A major change in biological goals and objectives or conservation measures if monitoring or research indicates that they are not attainable because technologies to attain them are either unavailable or infeasible.
- Extending the permit term beyond 50 years.
- Increasing the land acquisition requirements in excess of 5% of the original acreage requirement.

As described in Chapter 9, it is possible that, even over the full 50-year term of the permits, covered activities and authorized take might not occur to the extent projected in the Plan. If this occurs, fee revenues would likely fall short of projections. A shortfall of fee revenues could make it difficult or impossible for the Implementing Entity to complete the Reserve System, habitat restoration and creation requirements, and other components of the conservation strategy within the milestones described in Chapter 5 and Chapter 8, Section 8.12 *Schedule and Milestones* and within term of the permits. If this situation appears likely, the Permittees and the Wildlife Agencies will meet and confer to develop mutually agreeable terms, which could include, but are not limited to, the following:

- extend the term of the permits to allow completion of the conservation strategy, or
- reduce the amount of take authorized and reduce the conservation obligations of the Permittees.

## Amendment Process for the Section 10(a)(1)(B) Permits

To amend the Section 10(a)(1)(B) permits, the Implementing Entity Governing Board will submit a formal application to USFWS (or to NMFS if anadromous fish are proposed to be added to the Plan). This application must include a revised Habitat Plan, a permit application form, any required fees, a revised Implementing Agreement, and the required compliance document under NEPA. The appropriate NEPA compliance process and document will depend on the nature of the amendment being proposed. A new scoping process may be required, dependent upon the nature of the amendment. If additional scoping is deemed appropriate and necessary, USFWS and/or NMFS will publish a Notice of Intent in the Federal Register to initiate the scoping process. Upon submission of a completed application package, USFWS and/or NMFS will publish a notice

of the proposed application in the Federal Register, initiating the NEPA and HCP amendment review process. After public comment, USFWS or NMFS may approve or deny the permit amendment application.

## **Amending the NCCP Permit**

Procedures for applying for an amendment to the NCCP permit are included in the Implementing Agreement and will be processed in accordance with applicable NCCP Act requirements. The NCCP permit amendment will be subject to the requirements of CEQA, including a public review period. At the conclusion of the public review period, CDFG will either approve or deny the permit amendment. To approve the permit amendment, CDFG must make appropriate NCCP Act and CEQA findings.

## **Amendment Guidelines for Pacheco Dam Reconstruction and Reservoir Enlargement Project**

This section provides guidance for an amendment of the Habitat Plan to add the Pacheco Dam Reconstruction and Reservoir Enlargement project as a covered activity. This project is currently not a covered activity in the Plan (see Chapter 2) because it will take water from the Central Valley Project operated by the Bureau of Reclamation. A project description of the Pacheco Dam Reconstruction and Reservoir Enlargement Project adequate to complete an impacts analysis was also not available at the time of permit issuance for this Plan. Therefore, the permits for this Plan do not authorize take associated with this project. However, if SCVWD proceeds with this project, incidental take authorization could be obtained through an amendment of this Plan. Whether this Plan is amended to cover this project or not, the conservation strategy for the Pacheco Dam Reconstruction and Reservoir Enlargement Project will be consistent with the conservation strategy in this Plan.

If take authorization for this project is obtained through an amendment of the Habitat Plan the Permittees must follow all of the general requirements described above for amendments. To compensate for the additional impacts, the amendment must supplement the operating conservation strategy of this Plan.

The SCVWD will provide adequate funding to implement the modified conservation strategy and is expected to own and operate the expanded reservoir. Preserved lands will be enhanced, managed, and monitored consistent with the conservation strategy and monitoring and adaptive management program of this Plan. Land management and monitoring may be conducted by the Implementing Entity, SCVWD, or another Permittee.

The Wildlife Agencies have not provided assurances to accepting the specific terms of this amendment and will base their determination of whether or not to approve an amendment based on the conditions and analysis available at the time of application.

**Table 10-1.** Thresholds and Remedial Actions for Changed and Unforeseen Circumstances Addressed by the Plan

<b>Thresholds</b>				
<b>Circumstance</b>	<b>Changed (Funded)</b>	<b>Changed (Unfunded)</b>	<b>Unforeseen (Unfunded)</b>	<b>Remedial Actions</b>
Covered Species Listed	<ul style="list-style-type: none"> <li>Covered species listed</li> </ul>	<ul style="list-style-type: none"> <li>N/A</li> </ul>	<ul style="list-style-type: none"> <li>N/A</li> </ul>	<ul style="list-style-type: none"> <li>No changes to the terms and conditions of the Implementing Agreement or modifications to conservation measures are required.</li> </ul>
Non-covered species listed	<ul style="list-style-type: none"> <li>Non-covered species listed</li> </ul>	<ul style="list-style-type: none"> <li>N/A</li> </ul>	<ul style="list-style-type: none"> <li>N/A</li> </ul>	<ul style="list-style-type: none"> <li>Evaluate potential impacts of covered activities on the newly listed species, including an assessment of the presence of suitable habitat in impact areas.</li> <li>Develop measures to fully avoid impacts on the newly listed species until the Plan is amended to cover the species or comply with ESA and CESA via other means (i.e., individual Section 7 consultations, consistency determinations).</li> </ul>
Global Climate Change	<ul style="list-style-type: none"> <li>Increase in temperature of up to 2.8°C for any of the three baseline periods measured as a 10-year running average</li> </ul>	<ul style="list-style-type: none"> <li>N/A</li> </ul>	<ul style="list-style-type: none"> <li>increase in temperature greater than 2.8°C for any of the three baseline periods measured as a 10-year running average</li> </ul>	<ul style="list-style-type: none"> <li>Enhance monitoring to detect ecological responses to climate change (see Chapter 7).</li> <li>Identify target species most vulnerable to climate change and increase status-and-trend monitoring for those species.</li> <li>Alter conceptual ecological models for natural communities and covered species as a tool to devise improved management actions (see Chapter 7).</li> <li>Alter or conduct more intensive management actions on target/vulnerable species to facilitate shifts in species distribution (e.g., more active population management of covered species).</li> <li>Conduct more aggressive control of invasive species that respond positively to climate change.</li> <li>Implement other measures through the Adaptive Management Program (see Chapter 7) in ways consistent with permit obligations and with the consent of the Implementing Entity.</li> </ul>
Fire	<ul style="list-style-type: none"> <li>A single fire burning 2,235-7,599 acres in the Reserve System</li> <li>Any number of fires of any size that impact enhancement, restoration or creation projects<sup>1</sup></li> </ul>	<ul style="list-style-type: none"> <li>N/A</li> </ul>	<ul style="list-style-type: none"> <li>A single fire exceeding 7,599 acres in the Reserve System</li> <li>More than one fire in the Reserve System burning an excess of 7,599 acres</li> <li>Burned areas not containing enhancement,</li> </ul>	<ul style="list-style-type: none"> <li>Initiate a post-fire damage assessment within six months following the end of a fire in order to identify the appropriate post-fire restoration and rehabilitation actions.</li> <li>Initiate the appropriate actions, such as habitat restoration, invasive-species control and/or erosion control, in affected reserves to ensure the reestablishment of covered plants and other native vegetation through active or passive means, as appropriate, within one year post-fire.</li> </ul>

<sup>1</sup> For any individual fire exceeding 7,599 acres, remedial actions would be limited to enhancement, restoration and/or creation project sites (i.e., the entire burned area would not be subject to remedial actions).

**Table 10-2.** Natural Community-Specific Fire Return Intervals

Natural Community	Fire to Return Interval <sup>1</sup> (Average Years)				Return Intervals (years) Defining Unforeseen Circumstance
	Classification <sup>2</sup>	Pre-Historic <sup>3</sup>	Historic <sup>3</sup>	Current <sup>4</sup>	
Grassland	Truncated short-short	1 to 2	10 to 30	25 to 35	< 5
Chaparral/coastal scrub	Truncated short-medium	1 to 2 1 to 15 10 to 35	10 to 30 20 to 30 7 to 29	25 to 35 125 to 250	< 5
Oak woodland	Truncated short-medium	1 to 2 10 to 35 30 to 135	50 to 75 10 to 30	150 to 250 25 to 35	< 10
Riparian forest and scrub	Long	–	–	Over 100 years	< 25
Conifer woodland	Short-long	135	20 to 50 4 to 12	50, 9 to 16 100 to 150	< 5
Wetland <sup>5</sup>	Short	1 to 2	10 to 30	25 to 35	< 5

<sup>1</sup> Multiple fire return intervals are stated for some of the natural communities due to variable fire return intervals stated for the land cover types within each natural community grouping. In addition, fire return intervals are highly variable for individual land cover types (e.g., redwood) depending on site specific variables (e.g., location, topographical isolation).

<sup>2</sup> Sugihara et al. (2006) identified six conceptual fire-return interval patterns occurring in California ecosystems. Ecosystems with a *truncated short fire return interval* experience all-area burns reoccurring at short interval. Longer return intervals for these ecosystems result in type conversion. Ecosystems with a *short fire return interval* experience large-area burns reoccurring at a short interval; however, there is a wide range including a small portion with longer intervals. Long intervals punctuated by short interval burns allow for greater complexity of non-dominate species. *Truncated medium fire-return interval* ecosystems experience a range of area burns. Upper and lower limits are defined by characteristic species life histories. Intervals outside range result in type conversion. *Medium fire-return interval* ecosystems experience area burns at medium-return intervals; however, deviation from interval does not usually result in type conversion. Ecosystems with a *truncated long fire-return interval* experience all-area burns at long intervals, typically 70 or more years; however, repeat fires within a few years or decades do not result in type conversion. *Long fire-return interval* ecosystems have long partial-area or all-area fire-return intervals. Shorter, reoccurring fires may occur in small areas without type conversion occurring.

<sup>3</sup> Return interval influenced by burning conducted by Native Americans (pre-historic) and Europeans (historic).

<sup>4</sup> Return interval influenced by fire suppression.

<sup>5</sup> Assumed to be the same as grassland.

**Table 10-3.** Modeled Habitat for Eligible Covered Species found on Eligible Neighboring Lands<sup>1</sup>

	Primary Habitat	Secondary Habitat	Dispersal Habitat	Total
California red-legged frog	51 acres	0 acres <sup>2</sup>	17,951 acres	18,002 acres
California tiger salamander	0 acres	19,189 acres	N/A	19,189 acres
Western pond turtle	2,421 acres	12,732 acres	N/A	15,153 acres

Notes:

<sup>1</sup> Assumes maximum amount of land eligible for program. This analysis assumes that none of the existing cultivated agriculture eligible for the program will be lost to covered activities.

<sup>2</sup> Refugia habitat.

## Chapter 11

# Alternatives to Take

The ESA requires that applicants for incidental take permits specify in an HCP what alternative actions to the take were considered and the reasons why those alternatives were not selected. The *Endangered Species Consultation Handbook* (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1998) identifies two alternatives commonly used in HCPs: (1) an alternative that would reduce take below levels anticipated for the proposed project and (2) an alternative that would avoid take and hence not require a permit from USFWS. The NCCP Act requires that project alternatives be considered in the EIR prepared for the NCCP (Section 2820[e]) but not in the NCCP itself.

This chapter identifies alternative measures considered that would avoid or minimize the potential for take of each wildlife species covered in this Plan. The following discussion is limited to wildlife species because the ESA requires alternatives to *take*. Take of listed plants is not prohibited by the ESA, and projects subject to Section 7 consultations will evaluate listed plants in the Biological Assessment and Biological Opinion associated with that consultation. As of the effective date of the Federal permit, take of covered species that are currently federally listed will be authorized as described in the Plan. Project alternatives are considered in more detail in the draft EIR/EIS that accompanies this draft Plan. This chapter evaluates alternatives to take for all of the wildlife species covered by the Plan:

- Bay checkerspot butterfly (threatened)
- California red-legged frog (threatened)
- California tiger salamander (threatened)
- Foothill yellow-legged frog
- Western pond turtle
- Least Bell's vireo (endangered)
- Western burrowing owl
- Tricolored blackbird
- San Joaquin kit fox (endangered)

## 11.1 Alternatives to Take of Bay Checkerspot Butterfly

The only known extant populations of Bay checkerspot butterfly occur within the study area. Primary impacts to this species include the expansion of urban areas or rural residential development that removes or isolates serpentine grassland habitat. These changes in land use can also increase recreational use on or limit the management of serpentine grasslands, which could also adversely affect the butterfly. Additionally, covered activities that facilitate future growth along the U.S. 101 corridor could lead to an increase in the amount of vehicle traffic and increase the rate of nitrogen deposition on serpentine grasslands in the permit area. Increased nitrogen deposition is known to change the alkalinity of serpentine soils, which reduces the competitive advantage that native plants experience in these areas, resulting in decreased abundance of the native host and larval plants of the Bay checkerspot butterfly (see discussion in Chapter 4 *Impact Assessment and Level of Take*).

Also, certain management actions for Bay checkerspot butterfly under the Plan could result in take of the species. Management actions will include livestock grazing and, in some areas, controlled burning to reduce the cover of nonnative plant species. Targeted use of herbicides, mowing, hand-weeding, or other aggressive removal techniques will be necessary in small areas to combat infestations of noxious weeds in serpentine grasslands such as barbed goatgrass. All of these actions could kill individual butterflies or their larvae. If Bay checkerspot butterflies do not disperse to new suitable habitat on their own the Implementing Entity may translocate butterflies to establish new populations in these areas, upon approval by the Wildlife Agencies. If translocation is implemented, butterfly mortality could occur during or after movement. Given these risks of mortality, one alternative is not to implement the management actions as described in the conservation strategy (see Chapter 5). This alternative is not preferred because active management is essential for the maintenance of the suitable habitat for the species. The benefits of this active management far outweigh the negative effects it may have on a small number of individuals. The management actions described in the conservation strategy will greatly benefit the species and will contribute substantially to its recovery.

An alternative prohibiting development on serpentine soils within the permit area would reduce but not eliminate take of the species, since nitrogen deposition from existing road traffic would continue to alter plant composition to the detriment of Bay checkerspot butterfly. This alternative is inconsistent with the currently adopted general plans of local jurisdictions and would therefore be infeasible.

In addition, because nonnative plants threaten to outcompete the host and nectar plants necessary for Bay checkerspot butterfly survival, some form of management is needed to maintain and increase viable habitat for the species. An alternative that eliminates take does not create a mechanism by which land is managed for the benefit of the butterfly and therefore is biologically inferior to the approach proposed by the Habitat Plan.

An alternative that limits growth or reduces traffic along the U.S. 101 corridor could reduce impacts to Bay checkerspot butterfly. However, this approach is infeasible because much of the traffic on U.S. 101 comes from outside the jurisdictions participating in this Plan. Furthermore, limiting growth along U.S. 101 is inconsistent with the approved general plans of the County and the Cities of San José, Morgan Hill and Gilroy.

In summary, implementation of this Plan is expected to provide a substantial net benefit to, and contribute to the recovery of, Bay checkerspot butterfly in the permit area. Serpentine grasslands will be protected and managed to the benefit of the species. Up to 300 acres (4%) of modeled primary habitat will be permanently affected by covered activities, but impacts would be limited to no more than 3% of the unprotected portion of each core and satellite habitat unit targeted for conservation (as defined in **Table 5-7**) with the exception of the Kirby/East Hills core unit which has a 11% allowance to accommodate the Kirby Landfill expansion (80 acres). The Reserve System will protect an estimated 3,800 acres of modeled primary habitat, all of which will be enhanced. An additional 754 acres of modeled primary habitat will be added to the Reserve System from existing open space, within which, degraded habitat will also be enhanced. This will result in a 341% increase of lands managed as primary habitat in type 1 open space and a total of 62% of existing modeled habitat preserved in type 1 open space. New reserves will ensure protection of the ranges of slopes, aspects, and microhabitats important to the species. Reserve management of habitat will enhance populations of larval host plants and adult nectar sources to allow for natural migration across reserves. These and additional management actions (see Chapter 5 *Conservation Strategy*) along with avoidance and minimization measures (see Chapter 6 *Conditions on Covered Activities and Application Process*) are expected to benefit the species in the permit area to a greater degree than any alternatives that may reduce take.

## 11.2 Alternatives to Take of California Red-Legged Frog

California red-legged frogs utilize several land cover types for breeding and summer refugia, including riverine habitats, seasonal wetlands, freshwater marshes, and ponds. Frogs also aestivate in a variety of upland land cover types including annual grassland and oak woodland. As a result, impacts to California red-legged frog could occur from numerous covered activities that remove aquatic or upland habitats or that temporarily disturb areas utilized by the frog. These covered activities include urban and rural development as well as implementation of in-stream capital projects, rural water-supply projects, related operations and maintenance, and, to a lesser extent, implementation of the conservation strategy.

Take of California red-legged frog could be minimized or avoided if these covered activities did not encroach on habitat for this species; fill or disturb breeding or summer refugia sites (e.g., ponds, seasonal wetlands, streams); or

remove aestivation or movement habitat connecting breeding sites. Because habitat for the species is widespread (especially upland aestivation or dispersal habitat), avoidance of all take is infeasible. Similarly, in-stream capital projects, water-supply projects and related operations and maintenance have the potential to take red-legged frogs. However, failing to carry out flood control, as well as other needed services would jeopardize human health and safety and would not be feasible.

Conservation and management actions that take place on the Reserve System, particularly those that enhance, restore, or create habitat, have the potential to take California red-legged frogs. Increasing the connectivity between breeding sites and increasing the frequency of monitoring surveys in the study area have the potential to facilitate the spread of detrimental environmental factors (e.g., chytrid fungus, nonnative predators). Although these actions could harm individual frogs, they are designed to provide a substantial net benefit to the species on the reserves. Ultimately the benefits gained from Plan implementation are expected to strongly outweigh any potential impacts or take. Under the Plan, take will be minimized or avoided through implementation of the following conditions on development discussed in Chapter 6:

- Condition 3. *Maintain Hydrologic Conditions and Protect Water Quality.*
- Condition 4. *Avoidance and Minimization for In-Stream Projects.*
- Condition 5. *Avoidance and Minimization Measures for In-Stream Operations and Maintenance.*
- Condition 11. *Stream and Riparian Setbacks.*
- Condition 12. *Wetland and Pond Avoidance and Minimization.*

Take of California red-legged frog as a result of urban development could be avoided entirely if projects did not encroach on or near habitat for red-legged frog. However, this alternative is not feasible because it is inconsistent with adopted local General Plans and fails to meet the purpose and need of the Permittees to achieve reasonable amounts of urban development and growth within their jurisdictions.

Another alternative to take from urban expansion is to require all development projects to avoid direct impacts to suitable habitat for this species. Presumably each project would be able to build on a portion of the site while setting aside the portion of the site suitable for the species. This alternative approach, however, would result in a patchwork of habitat that would not function well biologically on a regional scale because it would be interspersed with urban and rural development. In addition, this alternative would not address the indirect effects associated with development (e.g., decreased water quality, increased harm and harassment from humans and their pets). Therefore, this alternative was rejected because it would result in a biologically inferior outcome. The Plan is designed to accept a limited amount of take of red-legged frog habitat in exchange for protection, enhancement, and restoration of high-quality habitat outside urban and urbanizing areas. Most of the take will be in lower-quality habitat, although some of it will occur in higher-quality habitat as well.

Implementation of this Plan is expected to provide a net benefit to, and contribute to the recovery of, California red-legged frog in the permit area. The red-legged frog is threatened by loss of habitat and extensive fragmentation both between summer refugia and breeding sites and among wetland/pond complexes. Up to 415 acres (4%) of modeled primary habitat and 14,426 acres (4%) of secondary habitat will be affected by covered activities. The Reserve System will acquire, protect and enhance an estimated 1,300 acres of primary habitat and 30,000 acres of secondary habitat. In addition, 130 acres of primary habitat, 11,800 acres of secondary habitat will be added to the Reserve System from existing open space. Degraded habitat within existing open spaces added to the Reserve System will also be enhanced. This will result in an increase of 93% of modeled habitat in type 1 open space and a total of 26% of modeled habitat in type 1 open space. In addition to the Plan's requirements for California red-legged frog habitat acquisition, an estimated 117 acres of perennial wetlands and ponds and 10.4 miles of stream will be created or restored in the Reserve System if all impacts under the Plan occur. Some of these creation and restoration sites may be suitable habitat for the California red-legged frog. A network of core reserves will protect large blocks of breeding and non-breeding habitat. New linkages will be created in blocks of modeled habitat to facilitate dispersal and colonization throughout the study area and movement between breeding sites. Habitat management will improve quality of breeding habitat (e.g., predator eradication, woody debris and native vegetation installation, stream and riparian restoration) and upland habitat. These and additional management actions (see Chapter 5 *Conservation Strategy*) and conditions on covered activities (see Chapter 6 *Conditions on Covered Activities and Application Process*) are expected to benefit California red-legged frog in the permit area to a greater degree than any considered alternatives.

## 11.3 Alternatives to Take of California Tiger Salamander

California tiger salamanders utilize seasonal wetlands, marshes, and ponds during different times of the year, and upland habitat in close proximity to water habitat. Ponds and wetlands in the study area provide breeding habitat for California tiger salamander and adjacent uplands habitat accommodate year-round uses (e.g., upland refugia and dispersal).

California tiger salamander could be taken by rural development; a small portion of urban development; conversion of habitat to agriculture (e.g., vineyards); implementation of in-stream capital projects, rural water-supply capital projects and related operations and maintenance; and implementation of the conservation strategy. These projects could impact suitable breeding ponds and wetlands or suitable upland refugia. Rural development could also cause fragmentation of breeding habitat.

Take of California tiger salamander by rural development could be reduced by requiring all development projects to avoid all suitable habitat for this species.

However, as for the California red-legged frog, this alternative approach would result in a patchwork of habitat that would not function well biologically. Therefore, this alternative conservation approach was rejected because it would result in a biologically inferior outcome. The Plan is designed to accept a limited amount of impacts to tiger salamander habitat in exchange for protection, enhancement, and restoration of higher-quality habitat outside urban areas. Most of the take will be in lower-quality habitat, although a limited amount will be in higher-quality habitat. In addition, ancillary benefits for the California tiger salamander are gained through water quality protections required by Condition 3 and stream setbacks required by Condition 11 (see Chapter 6 *Conditions on Covered Activities and Application Process*).

Another alternative that may reduce take of California tiger salamander in the study area is the prohibition of irrigated agriculture on suitable breeding or movement/upland refugia habitat. However, only agricultural activities that require a County permit are covered by this Plan. Irrigation that is part of routine and ongoing agriculture does not require a permit from the County, and therefore is not subject to the restrictions of this Plan. In addition, most agriculture in the study area occurs on the valley floor, while known occurrences of California tiger salamander are generally in the foothills outside the valley floor. In addition, a “freedom to farm” policy in the County makes regulation of agriculture difficult to implement. Therefore, this alternative was rejected.

Some of the management actions prescribed by this Plan may cause take of some individual California tiger salamanders. Specifically, increasing the connectivity between breeding sites and increasing the frequency of monitoring surveys in the study area have the potential to facilitate the spread of detrimental environmental factors (e.g., chytrid fungus, nonnative predators). It is also possible that increasing connectivity and the number of California tiger salamander populations could further facilitate hybridization between the California tiger salamander and the Texas salamander. However, the conservation strategy includes management and research actions to prevent or reduce these threats. Ultimately the benefits gained from Plan implementation are expected to strongly outweigh any potential impacts or take.

Implementation of this Plan is expected to provide a substantial net benefit to, and contribute to the recovery of, California tiger salamander in the permit area. The tiger salamander is threatened by loss of habitat and extensive fragmentation both between upland and breeding sites and among wetland/pond complexes. Up to 91 acres (9%) of modeled breeding habitat and 14,384 acres (4%) of modeled non-breeding habitat will be affected by covered activities. The Reserve System will acquire and protect an estimated 150 acres of breeding habitat and 30,000 acres of non-breeding habitat. In addition, 45 acres of breeding habitat and 11,700 acres of non-breeding habitat will be added to the Reserve System from existing open space. This will result in an increase of 91% of lands managed as species habitat in type 1 open space and a total of 27% of existing modeled habitat preserved in type 1 open space. Within the Reserve System an estimated 147 acres of perennial wetlands, seasonal wetlands, and ponds will be created or restored if all impacts under the Plan occur. Some of these creation and restoration sites may be suitable habitat for the California tiger salamander.

A network of core reserves will protect large blocks of breeding and non-breeding habitat. New linkages will be created in blocks of modeled habitat to facilitate dispersal and colonization throughout the study area and movement between breeding sites. Habitat management will improve the quality of breeding habitat (e.g., predator eradication and wetland enhancement and restoration) and upland habitat. These and additional management actions (see Chapter 5 *Conservation Strategy*) and conditions on covered activities (see Chapter 6 *Conditions on Covered Activities and Application Process*) are expected to benefit the species in the permit area to a greater degree than any considered alternatives.

## 11.4 Alternatives to Take of Foothill Yellow-Legged Frog

Foothill yellow-legged frogs require shallow, flowing water in small to moderate-sized streams with at least some cobble-sized substrate. This species would be affected by projects implemented in the stream channel or that result in the removal of cobblestone substrate or riparian vegetation, particularly in reaches above reservoirs. Ground-disturbing activities, such as maintenance of stream banks, levees, and channel rights-of-way (e.g., bank repair, vegetation management), could increase erosion and sediment discharge that could disrupt breeding of foothill yellow-legged frogs. Projects that place structures in the channel (e.g., culvert installation) or that require stream access may crush individuals and expose adults, metamorphs, and tadpoles. If water pulses from reservoirs are released during the foothill yellow-legged frog egg-laying period, they could dislodge egg masses, causing mortality.

One alternative to take of yellow-legged frog would be to refrain from implementing flood-control and other in-stream capital projects. However, this alternative would not provide flood protection to many neighborhoods and areas that are currently vulnerable to flooding. In addition, many of these flood-control projects are part of the SCVWD Clean, Safe Creeks and Natural Flood Protection Plan or the Coyote Watershed Stream Stewardship Plan. The former is a 15-year, countywide plan funded by a special tax that directs the SCVWD to protect public health and safety, in part through the construction of flood-control projects. The latter plan was developed by the SCVWD to address flooding and environmental issues in the Coyote watershed through an integrated approach to watershed management. The alternative of not implementing in-stream capital projects is infeasible because it would not provide needed flood protection and because it is inconsistent with the adopted and funded plans of SCVWD.

Another alternative to take of yellow-legged frog is to refrain from levee improvements within the study area. However, this would be out of compliance with levee-recertification requirements being developed by the Federal Emergency Management Agency and would affect public safety. Therefore this is not a feasible alternative.

Implementation of this Plan is expected to provide a substantial net benefit to, and contribute to the recovery of, foothill yellow-legged frog in the permit area. Up to 8.7 stream miles (<1%) of modeled primary and secondary habitat will be affected by covered activities. The Reserve System will protect an estimated 30 stream miles of modeled primary habitat and 50 miles of modeled secondary habitat. In addition, 7 stream miles of modeled primary habitat and 17 stream miles of modeled secondary habitat will be added to the Reserve System from existing open space. This will result in an 88% increase of protected modeled primary and secondary habitat in type 1 open space and protection of a total of 32% of modeled primary and secondary habitat in type 1 open space. In addition to the Plan's acquisition requirements of primary foothill yellow-legged frog habitat, the Reserve System will contain an estimated 10.4 miles of restored streams if all impacts under the Plan occur. Some of these 10.4 miles of restored streams may also be suitable for the foothill yellow-legged frog. Protection of streams with perennial flows will target reaches with high habitat value or restoration potential. Restoration and enhancement of perennial streams will ensure improvement of habitat quality and breeding success. These and additional management actions (see Chapter 5 *Conservation Strategy*) and conditions on covered activities (see Chapter 6 *Conditions on Covered Activities and Application Process*) are expected to benefit the species in the permit area to a greater degree than any considered alternatives.

## 11.5 Alternatives to Take of Western Pond Turtle

Western pond turtles utilize riverine habitats as well as seasonal wetlands, marshes, ponds, and upland habitat in close proximity to water. Uplands in the study area adjacent to ponds and wetlands with the appropriate soil substrate provide breeding habitat for western pond turtle, and adjacent upland habitat also accommodates year-round uses (e.g., aestivation, refugia, dispersal). In addition, this species requires basking sites in the water for year-round use.

Western pond turtle could be affected by rural development; a small portion of urban development; conversion of habitat to agriculture (e.g., vineyards); implementation of in-stream capital projects, rural water-supply capital projects and related operations and maintenance; and implementation of the conservation strategy. These projects could impact suitable breeding uplands adjacent to ponds and wetlands or suitable upland aestivation habitat. Rural development could also cause fragmentation of breeding habitat.

Take of western pond turtle by rural development could be reduced by requiring all development projects to avoid all suitable habitat for this species. However, as discussed above for the California red-legged frog, this alternative approach would result in a patchwork of habitat that would not function well biologically. Therefore, this alternative conservation approach was rejected because it would result in a biologically inferior outcome. The Plan is designed to accept a limited amount of impact to pond turtle habitat in exchange for protection, enhancement, and restoration of higher-quality habitat outside urban areas. Most of the take will be in lower-quality habitat, although a limited amount will be in higher-

quality habitat. In addition, indirect impacts to riverine habitat are avoided and minimized through water-quality protections required by Condition 3 and stream setbacks required by Condition 11 (see Chapter 6 *Conditions on Covered Activities and Application Process*).

Another alternative that may reduce take of western pond turtle in the study area is the prohibition of irrigated agriculture on suitable breeding or movement/aestivation habitat. However, only agricultural activities that require a County permit are covered by this Plan. Irrigation is part of routine and ongoing agriculture, does not require a permit from the County, and therefore is not subject to the restrictions of this Plan. In addition, most agriculture in the study area occurs on the valley floor, while known occurrences of western pond turtle are generally in the foothills outside the valley floor. Also, a “freedom to farm” policy in the County makes regulation of agriculture difficult to implement. Therefore, this alternative was rejected.

Implementation of this Plan is expected to provide a substantial net benefit to, and contribute to the recovery of, western pond turtle in the permit area. Up to 2,264 acres (3%) of modeled primary habitat and 8,811 acres (4%) of secondary habitat will be affected by covered activities. The Reserve System will acquire and protect an estimated 7,000 acres of modeled primary habitat and 20,000 acres of modeled secondary habitat. In addition, 2,800 acres of primary habitat and 9,100 acres of secondary habitat will be added to the Reserve System from existing open space. This will result in an 87% increase of lands managed as species habitat in type 1 open space and preservation of a total of 27% of existing modeled habitat in type 1 open space. Within the Reserve System, a minimum of 20 acres of ponds will be created and 1 stream mile restored, regardless of impacts. If all impacts under the Plan occur, up to 72 acres of ponds and 10.4 miles of streams will be created or restored. Some of these creation and restoration sites may be suitable habitat for the western pond turtle. A network of core reserves will protect large blocks of breeding and non-breeding habitat. New linkages will be created in blocks of modeled habitat to facilitate dispersal and colonization throughout the study area and movement between breeding sites. Habitat management will improve quality of breeding habitat (e.g., predator eradication and access control programs, woody debris and native vegetation installation) and upland habitat (e.g., grassland management). These and additional management actions (see Chapter 5 *Conservation Strategy*) and conditions on covered activities (see Chapter 6 *Conditions on Covered Activities and Application Process*) are expected to benefit the species in the permit area to a greater degree than any considered alternatives.

## 11.6 Alternatives to Take of Least Bell’s Vireo

Least Bell’s vireo is currently not known to breed in the study area, but it has been observed foraging on both Llagas and Coyote Creeks in the study area in recent years. It has also been documented successfully breeding east of the study area, in the San Joaquin River National Wildlife Refuge, for two consecutive years. It is reasonable to assume that the species breeding and foraging range

will expand northward into the study area, especially given that riparian habitat will be preserved, enhanced, and restored during the permit term. Therefore, the Plan anticipates impacts to and conservation of the species and its habitat.

Least Bell's vireos breed in the early successional riparian habitat during the spring and summer months.

Take of least Bell's vireo could result from covered activities that remove or alter early successional riparian habitat within the study area, particularly in the southern part of the study area. Impacts could also occur from any activity that diminishes dynamic riverine events (i.e., floods) that create early successional habitats, although such action may not rise to the level of take. Additional direct and indirect impacts could occur from adjacent land uses that alter associated riverine habitat or increase nearby populations of nest predators (e.g., domestic cats) or nest parasites (e.g., brown-headed cowbirds). While take of most migratory birds is prohibited under the Migratory Bird Treaty Act of 1918, take of least Bell's vireo would be permitted under a Special Purpose Permit for ESA-listed species (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1998: Appendix 5).

Alternative covered activities that do not include in-stream capital flood-control projects or vegetation removal for stream maintenance could reduce or eliminate impacts to least Bell's vireo. However, this alternative would put the upstream communities of Gilroy and Morgan Hill and unincorporated portions of the County at greater risk of flooding. It would also be incompatible with the Clean, Safe Creeks and Flood Protection Plan, a 15-year, countywide, special-tax-funded plan, which directs the SCVWD to protect public health and safety, in part through the construction of flood-control projects. Because the vireo requires early successional habitats, some vegetation removal is likely necessary to maintain suitable habitat. For these reasons, this alternative was rejected.

Implementation of this Plan is expected to provide a net benefit to least Bell's vireo in the permit area. Up to 115 acres (4%) of modeled primary habitat will be affected by covered activities. The Reserve System will acquire and protect a minimum of 460 acres of modeled primary habitat. In addition, 2 acres of modeled primary habitat will be added to the Reserve System from existing open space. All species habitat will be enhanced. This will result in a 865% increase of preserved modeled habitat as type 1 open space and a total of 20% of modeled habitat preserved as type 1 open space. In addition to the Plan's acquisition requirements of least Bell's vireo primary habitat, the Reserve System will include a minimum of 50 acres of restored riparian forest and scrub, regardless of impacts. If all impacts under the Plan occur, up to 353 acres of riparian forest and scrub and Central California alluvial sycamore woodland will be restored, some of which may be primary habitat for the least Bell's vireo. New reserves will increase habitat connectivity by targeting areas along rivers. Habitat management will ensure improvement of habitat quality and favor increased reproductive success through riparian woodland and forest enhancement and restoration. The Plan also requires 1:1 restoration for any loss of riparian forest and scrub communities (including *willow riparian forest and scrub* and *mixed riparian forest and woodland*, see **Table 5-12** and text in Chapter 5 *Conservation*

*Strategy*) These and additional management actions (see Chapter 5 *Conservation Strategy*) and conditions on covered activities (see Chapter 6 *Conditions on Covered Activities and Application Process*) are expected to benefit the species in the permit area to a greater degree than any considered alternatives.

## 11.7 Alternatives to Take of Western Burrowing Owl

Western burrowing owl habitat includes annual grassland, serpentine bunchgrass grassland, valley oak woodland, agricultural, barren land cover types with flat (0–5%) or moderate (5–25%) slopes, and ruderal habitats on the valley floor. Only a few of these sites, primarily in San José, are occupied by breeding owls on a consistent basis, but there is the potential for these small pockets of habitat to support breeding pairs. Specific sites that support the owl are targeted for nearby land acquisition to protect this species and provide additional habitat for fledging young birds. Western burrowing owls use the ground squirrel burrows for shelter and breeding. Primary threats to this species by covered activities include development of their habitat in suburban and rural areas and ground squirrel control along levees and dams and in rural areas. While take of most migratory birds is prohibited under the Migratory Bird Treaty Act of 1918, take of western burrowing owl would be permitted under a Special Purpose Permit in the event that this species was federally listed (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1998: Appendix 5).

An alternative to covered activities that eliminate or greatly reduce suburban or rural development could reduce take of the western burrowing owls and their habitat. However, based on general conservation biology principles development within already developed areas is preferable in order to reduce impacts to other covered species. Areas that are near known owl populations are targeted for protection and/or management within the Reserve System (see Section 5.4.6 *Western Burrowing Owl*). Therefore, an alternative to eliminate development in burrowing owl habitat was rejected.

An alternative to rodent control on levees was also considered. However, ground squirrel burrows can destabilize levees and dams, and eliminating ground squirrel control measures would not be consistent with the SCVWD Dam Maintenance Program or SCVWD stream maintenance needs. Therefore, this alternative was rejected.

Implementation of this Plan is expected to provide a substantial net benefit to, and contribute to the recovery of, western burrowing owl in the permit area. Up to 10,443 acres (8%) of modeled overwintering habitat will be affected by covered activities. The Reserve System will acquire and protect an estimated 17,000 acres of modeled species overwintering habitat and acquire or manage 5,300 acres of western burrowing owl nesting habitat (occupied and potential). Of the 5,300 acres, a minimum of 600 acres of occupied nesting habitat must be protected in fee title or conservation easement. For the remaining 4,700 acres, land acquisition (fee title or easement) or management agreements may be used,

with land acquisition prioritized over management agreements. In addition, 4,310 acres of modeled overwintering habitat will be added to the Reserve System from existing open space. The geographic breakdown of these newly managed areas for burrowing owls would include the following minimum acreages: 3,700 acres in the North San José/Baylands region, 800 acres in the Gilroy region, 530 acres in the Morgan Hill region, and 270 acres in the South San José region as shown in **Figure 5-10**. The conservation strategy will ensure management of both breeding and overwintering habitat. These and additional management actions (see Chapter 5 *Conservation Strategy*) and conditions on covered activities (see Chapter 6 *Conditions on Covered Activities and Application Process*) are expected to benefit the species in the permit area to a greater degree than any considered alternatives.

## 11.8 Alternatives to Take of Tricolored Blackbird

Tricolored blackbirds breed colonially in freshwater marshes and other wetland habitats with reeds, cattails, or other emergent or non-emergent wetland vegetation (such as blackberry). This species also requires foraging habitat that includes agricultural fields, wetlands, marshes, annual grassland, and riparian scrub. Potential tricolored blackbird breeding sites will be directly affected by any covered activities that result in the removal or permanent alteration of wetland or marsh habitat and/or adjacent foraging habitat. Conversion of lands from native or agricultural land cover to rural, suburban or urban use could result in the degradation of foraging habitat for this species. While take of most migratory birds is prohibited under the Migratory Bird Treaty Act of 1918, take of tricolored blackbird would be permitted under a Special Purpose Permit in the event that this species was federally listed (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1998: Appendix 5).

An alternative that prohibits development in or closely adjacent to marshes, wetlands and wetland vegetation would reduce take of tricolored blackbird habitat. Currently, the Plan includes extensive avoidance and minimization measures for these habitats (see Conditions 11 and 12 in, Chapter 6 *Conditions on Covered Activities and Application Process*) as well as specific conditions to survey for and avoid tricolored blackbird populations and individuals (see Condition 17 in Chapter 6 *Conditions on Covered Activities and Application Process*). The Plan also includes required conservation measures for habitat creation and preservation to ensure at least 2 acres of freshwater wetlands are preserved and one acre restored for each acre of freshwater wetlands lost to covered activities. Similarly, impacts to streams require 3:1 preservation and 1:1 restoration.

Alternative covered activities that do not include in-stream capital flood-control projects or vegetation removal for stream maintenance could reduce or eliminate impacts to tricolored blackbird. However, this alternative could put the upstream areas at greater risk of flooding and it would also be incompatible with the Clean, Safe Creeks and Flood Protection Plan of SCVWD. Therefore, this alternative was rejected.

Alternatives that entirely eliminate conversion of native or agricultural land to rural, suburban or urban use could prevent some take of tricolored blackbird foraging habitat, however this option is incompatible with the County General Plan and the General Plan of the cities of Gilroy and Morgan Hill (there will be little agricultural conversion in San José) and was therefore rejected. Further, surveys during the design phase of a project will require avoidance and minimization of impacts to tricolored blackbird (see Condition 17 in Chapter 6 *Conditions on Covered Activities and Application Process*).

Implementation of this Plan is expected to provide a substantial net benefit to, and contribute to the recovery of, tricolored blackbird in the permit area. Up to 11,454 acres (8%) of modeled habitat will be affected by covered activities. The Reserve System will acquire and protect an estimated 19,000 acres of modeled species habitat. In addition, 3,840 acres of modeled species habitat will be added to the Reserve System from existing open space. All species habitat within the Reserve System will be enhanced. This will result in a 207% increase of lands managed as species habitat and the protection of a total of 24% of existing modeled habitat as type 1 open space. Within the Reserve System, a minimum of 40 acres of ponds and perennial wetlands will be created or restored, regardless of impacts. If all impacts under the Plan occur, up to 117 acres of ponds and perennial wetlands will be created or restored. Some of these creation and restoration sites may be suitable habitat for the Tricolored blackbird. New reserves will ensure protection of at least four currently occupied or historic breeding sites and nearby foraging habitat. These and additional management actions (see Chapter 5 *Conservation Strategy*) and conditions on covered activities (see Chapter 6 *Conditions on Covered Activities and Application Process*) are expected to benefit the species in the permit area to a greater degree than any considered alternatives.

## 11.9 Alternatives to Take of San Joaquin Kit Fox

The primary impact to San Joaquin kit fox from covered activities is additional habitat fragmentation and associated reduction of adequate corridors in the southern portion of the study area near the Pajaro River and Pacheco Creek. The primary mechanism of this impact is human population growth in Gilroy and increased urbanization in southeastern Gilroy and limited rural development along the SR 152 corridor east of Gilroy (within unincorporated Santa Clara County). San Joaquin kit fox may move through the southeastern portion of the study area from San Benito County to adjacent Merced and Stanislaus Counties. This loss of habitat or movement corridors could result in harm to San Joaquin kit fox and hence constitute take. Another potential cause of take is construction of rural roads or increases in rural vehicle traffic along SR 152 that could result in mortality.

One alternative to take is the prohibition of rural development along the SR 152 corridor east of Gilroy. However, this is inconsistent with the County General Plan. Rural development along SR 152 east of Gilroy is expected to occur at very low densities and is not expected to increase substantially during the permit

term due to its distance from public services, large parcel sizes, and strong local tradition of agriculture in the Pacheco Creek valley and ranching in the adjacent hills. As such, threats to kit fox in this area from rural development are relatively low. Because habitat in the study area is not known to be occupied by kit fox, it is legally and practicably infeasible to preclude growth in all areas of unoccupied but suitable habitat for the species, so this alternative was rejected.

An alternative that limits traffic on rural roads within suitable secondary habitat (movement corridors) for San Joaquin kit fox may reduce the incidence of mortality on roads and therefore reduce take in the study area. This alternative was deemed infeasible and rejected because limiting traffic on rural roads is not under the control of the Permittees or the Plan. Furthermore, SR 152 is the only route that crosses from south Santa Clara County to the San Joaquin Valley. Directing traffic to other routes would be infeasible and would divert heavy traffic to other routes, some of which already receive heavy use. This alternative could have severe impacts on traffic elsewhere in the region and could negate the benefits provided to San Joaquin kit fox in the south part of the study area by increasing vehicle mortality of kit foxes elsewhere in its range. It could also increase impacts to Bay checkerspot butterfly by increasing vehicular emissions in the study area from slower traffic. Because San Joaquin kit fox have not been sighted in the study area in recent years, take from vehicular collision is highly unlikely at this time. As described in Chapter 5, there are several wide undercrossings available to kit fox and other species under SR 152 that would already limit the risk of vehicle collisions.

Implementation of this Plan is expected to provide a net benefit to San Joaquin kit fox in the permit area. The study area is outside the core range of the kit fox but is important as a movement route, although that may change with the habitat acquisition and management proposed by the conservation strategy. As such, the corridor study proposed by the Plan as well as actions that enhance key corridor routes are likely to benefit the species.

Up to 278 acres (<1%) of modeled habitat will be affected by covered activities. The Reserve System will acquire and protect an estimated 4,100 acres of modeled secondary habitat. Within the Reserve System all habitat will be enhanced. This will result in an increase of 81% of protected modeled habitat in type 1 open space and a total of 22% of modeled habitat protected in type 1 open space. A network of core reserves and movement routes will protect a critical linkage for San Joaquin kit fox through the study area to adjacent populations in Alameda and Contra Costa Counties. Grassland and oak woodlands will be managed to support a sustainable prey population. Barriers to passage will be removed and structural improvements to facilitate movement will be implemented to improve species passage across SR 152. A public-awareness campaign will encourage species-compatible land uses outside the Reserve System. These and additional management actions (see Chapter 5 *Conservation Strategy*) and conditions on covered activities (see Chapter 6 *Conditions on Covered Activities and Application Process*) are expected to benefit the species in the permit area to a greater degree than any considered alternatives.

## 13.5.2 Personal Communications

Coletto, Henry. Santa Clara County game warden, California Department of Fish and Game (retired). Winter/spring 2007—phone conversations with Troy Rahmig, Jones & Stokes.

Diamond, Tanya. M.S. candidate. Department of Biological Sciences, San José State University. Phone conversations with Troy Rahmig, Jones & Stokes. Winter/spring 2007.

Fields, Justin. Tulare Hill/Coyote Ridge rancher. SCC Cattlemen's Association. March 2007—telephone conversation.

Gonsolin, E. 2010. Biologist. San José State University. March 2010—telephone conversation with Cori Mustin, U.S. Fish and Wildlife Service.

Gray, George. Senior state park resource ecologist, Monterey District. California Department of Parks and Recreation, Monterey, CA. July 2006—meeting with David Zippin and Ken Schreiber.

Hillman, Janell. 2006. Botanist. Santa Clara Valley Water District. December 2006, February 2007, and January 2010—meetings and e-mails.

Hillman, Janell. 2007. Botanist. Santa Clara Valley Water District. December 12, 2007—e-mail to Terah Donovan of Jones & Stokes.

Hillman, Janell. 2009. Botanist. Santa Clara Valley Water District. May 8, 2007—email correspondence with Kate Bode of ICF Jones & Stokes.

Hillman, Janell. 2010. Botanist. Santa Clara Valley Water District. September 15, 2010—e-mail to Rebecca Sloan of ICF.

Koopmann, Tim. Range manager. San Francisco Public Utility Commission, San Francisco, CA. July 7, 2003—conversation with Joel Gerwein (Jones & Stokes).

- Marker, Timothy. Manager of environmental engineering. Pratt & Whitney Rocketdyne. January 22, 2007—Monitoring data provided in a letter to Jones & Stokes from United Technologies Corporation-Pratt & Whitney Rocketdyne.
- Niederer, Christal. Botanist. Creekside Center for Ecosystem Observations, Menlo Park, CA. July 27<sup>th</sup>, 2010—E-mail exchange with Rebecca Sloan (Jones & Stokes).
- Patrie, Bob. President of the Pine Ridge Association. February 16, 2008—conversation with Troy Rahmig (Jones & Stokes).
- Rocha, Don. County of Santa Clara Parks & Recreation Department. April 27, 2010—e-mail to Kathryn Gaffney, ICF International.
- Serpa, Larry. Ecologist. The Nature Conservancy, Central Coast Region. May 10, 2007—Conversation with Troy Rahmig (Jones & Stokes).
- Weiss, Stuart. Biologist. Creekside Center for Earth Observation. February 2006 phone conversation and December 2006 meeting.
- Whittall, Justin. Biology Professor, Santa Clara University. February 4, 2010 Phone conversation with Kate Bode, Plant Ecologist, ICF international.

## Appendix A

# Glossary

## Definitions of Key Terms and Concepts

**Adaptive management.** A method for examining alternative strategies for meeting measurable biological goals and objectives, and then if necessary, adjusting future conservation management actions according to what is learned (65 Federal Register 106 35242–35257, June 1, 2000).

**Anthropogenic.** Caused or produced through human agency.

**Bankfull.** The incipient elevation on the bank where flooding begins. In many stream systems, the bankfull stage is associated with the flow that just fills the channel to the top of its banks and at a point where the water begins to overflow onto a floodplain (Leopold et al. 1964). The bankfull stage and its attendant discharge serve as consistent morphological indices which can be related to the formation, maintenance and dimensions of the channel as it exists under the modern climatic regime.

**Baseline.** The existing environmental state, which includes past and present impacts as well as the anticipated impacts of all permitted projects in the inventory area.

**Biodiversity.** The variety of organisms considered at all levels, from genetic variants of a single species through arrays of species to arrays of genera, families, and higher taxonomic levels; includes the variety of natural communities and ecosystems.

**Biological opinion (BO).** The document stating the opinion of the U.S. Fish and Wildlife Service and/or the National Oceanic and Atmospheric Administration's National Marine Fisheries Service as to whether or not a federal action is likely to jeopardize the continued existence of listed species or result in the destruction or adverse modification of critical habitat (50 Code of Federal Regulations 402.02). A biological opinion is one of the decision documents of a consultation under Section 7 of the federal Endangered Species Act.

**Biological goals.** Guiding principles for conservation within the study area based on the conservation needs of the covered species and natural communities. The goals describe the vision for the covered species and natural communities to be achieved through implementation of a successful conservation program. Biological goals are typically qualitative rather than quantitative (65 Federal Register 106 35242–35257, June 1, 2000).

**Biological objectives.** Measurable targets that will be sought to achieve the biological goal. Biological objectives are typically quantitative or at least measurable (65 Federal Register 106 35242–35257, June 1, 2000).

**Broad goals (or program goals).** Broad guiding principles for the entire Plan. These goals represent a summary of the “project purpose and need” for the Plan and may be incorporated as a mission statement for the process and the plan. These are a different set of goals than the biological goals and objectives.

**Building permit.** A permit issued by a city or county under the applicable construction code (e.g., Uniform Building Code) that authorizes the construction of new or expanded structures. A building permit does not include permits issued under plumbing, electrical, mechanical or other regulations for construction work in new or expanded structures.

**CEQA species.** Plant and animal species that are considered endangered, threatened, or rare under the California Environmental Quality Act (CEQA) and thus must be considered in CEQA documents, but are not species covered by the Plan (670.2 or 670.5, Title 14, California Code of Regulations). See also *Endangered species* and *Threatened species*.

**Changed circumstances.** Changes in conditions or other circumstances affecting a covered species or the geographic area covered by the Plan that can reasonably be anticipated by the Permittees and that can reasonably be planned for in the Plan (e.g., new species listings, fire, or other reasonably foreseeable natural catastrophic events).

**City limits.** Official jurisdictional boundary of a city.

**Coastal and valley freshwater marsh.** Wetlands dominated by emergent herbaceous plants (reeds, sedges, grasses) with either intermittent flooded or perennially saturated soils. Freshwater marshes are found throughout the coastal drainages of California wherever water slows down and accumulates, even on a temporary or seasonal basis.

**Compliance monitoring.** Monitoring that tracks the status of plan implementation, ensuring that planned actions are executed, including reserve design and creation, implementation of management activities, and implementation of monitoring activities (Atkinson et al. 2004).

**Conservation.** According to the federal Endangered Species Act, *conserve*, *conserving*, and *conservation* are the methods and procedures necessary to bring any endangered or threatened species to the point at which the measures provided under the Act are no longer necessary. Such methods and procedures include, but are not limited to, activities associated with resource management such as research, census, law enforcement, habitat acquisition and maintenance, propagation, live trapping, and transportation (16 U.S. Government Code 1532 [3]). According to the Natural Community Conservation Planning Act, *conserve*, *conserving*, and *conservation* are the use of methods and procedures within the Plan area that are necessary “to bring any covered species to the point

at which the measures provided pursuant to [the California Endangered Species Act] ... are not necessary, and for covered species that are not listed pursuant to [the California Endangered Species Act] ..., to maintain or enhance the condition of a species so that listing pursuant to [the California Endangered Species Act] ... will not become necessary.” In other words, the Natural Community Conservation Planning Act defines *conservation* as the steps necessary to remove a species from the California threatened or endangered species list (California Fish and Game Code 2085[d]).

**Conservation actions.** Specific activities that will be carried out to meet the conservation needs of the covered species and natural communities in order to achieve the biological goals and objectives.

**Conservation strategy.** The Plan’s overall and unified approach for achieving the biological goals and objectives. The conservation strategy is the collection of all conservation actions that will be implemented.

**Construction monitoring.** Monitoring by biologists of construction activities to ensure that conservation actions are implemented and impacts to biological resources are avoided or minimized in accordance with Plan requirements.

**Contribute to recovery.** Actions that measurably increase the baseline conditions necessary to support covered species and that contribute to the eventual delisting of a listed species or prevention of listing of a nonlisted species. A contribution to recovery does not include actions necessary to avoid, minimize, or mitigate impacts of covered activities.

**Cover (also canopy cover, areal cover).** The area of ground covered by vegetation of particular species or vegetation type, generally expressed as a percentage.

**Covered activities.** Those activities addressed in the Plan and for which the Permittees will seek a Natural Community Conservation Planning Act take permit pursuant to Section 2835 of the California Natural Community Conservation Planning Act, and an incidental take permit pursuant to Section 10 of the federal Endangered Species Act.

**Covered species.** Those species addressed in the Plan for which conservation actions will be implemented and for which the Permittees will seek authorization for take under Section 2835 of the California Natural Community Conservation Planning Act and Section 10 of the federal Endangered Species Act.

**Creation.** See *Habitat creation*.

**Critical habitat.** An area designated as critical habitat by the U.S. Fish and Wildlife Service or by the National Marine Fisheries Service pursuant to the federal Endangered Species Act. Critical habitat areas are specific geographic areas that may or may not be occupied by listed species or not, that are determined to be essential for the conservation and management of listed species, and that have been formally described and designated in the Federal Register (16 U.S. Government Code 1532 [5]).

**Cumulative impacts.** Result from the proposed actions' incremental impact when viewed together with past, present, and reasonably foreseeable future actions. Cumulative impacts are defined under both the ESA and NEPA. HCPs do not require a discussion of cumulative effects as analyzed under NEPA. However, as stated in the HCP handbook, "the applicant should help ensure that those considerations required of the Services by Section 7 have been addressed in the HCP" (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1996:3–15). Accordingly, the Plan addresses the cumulative effects of public or private activities that could result from individually minor but collectively significant actions that take place over time. Cumulative effects of all projects with a federal nexus will be analyzed under NEPA and will not be addressed in the Plan in accordance with the ESA regulatory guidelines.

**Direct impacts.** Defined as activities or projects that remove or alter land cover types, or covered species habitat, populations, or occurrences (or portions of thereof). Direct impacts are caused by the project and occur at the time and place of project implementation (e.g., ground disturbance, inundation). Direct impacts can be either permanent or temporary (see definitions of permanent and temporary impacts immediately below).

**Dominance.** The extent to which a given species predominates a community by virtue of its size, abundance, or coverage.

**Effectiveness monitoring.** The measurement of variables that allow the program to assess the success of the Habitat Plan in meeting its stated biological objectives (Atkinson et al. 2004).

**Ecological integrity.** Ecosystems have *ecological integrity* when their native components are intact, including abiotic components, biodiversity, and ecosystem processes.

**Ecosystem.** A community of organisms and their physical environment interacting as an ecological unit.

**Ecosystem function.** The sum total of processes operating at the ecosystem level, such as the cycling of matter, energy, and nutrients.

**Ecosystem restoration.** The reestablishment of ecological functions within an area that historically supported those functions.

**Ecosystem services.** The benefits that people derive from ecosystems, including both commodities and regulating, supporting, and cultural services.

**Endangered species.** A native species, subspecies, variety of organism, or distinct population segment (DPS) which is in serious danger of becoming extinct throughout all or a significant portion of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease (16 U.S. Government Code 1532[6]; California Fish and Game Code Section 2062).

**Endemic.** A species, subspecies, or variety found only in the region defined.

**Enhance.** See *Habitat enhancement*.

**Environmental gradient.** A shift in physical and ecological parameters across a landscape, such as changes in topography, climate, land cover types, or natural communities.

**Ephemeral stream.** A stream that flows only in response to rain events and receives no groundwater input. As defined in the Habitat Plan, ephemeral streams will not include irrigation ditches, underground streams, or drainages and swales that have neither defined bed and bank nor evidence of scour or sediment transport. All other ephemeral drainages that qualify as streams will be considered under the Habitat Plan.

**Exception.** An allowance for reductions in mandated setback distances necessary to allow reasonable use and development of a property based on the variety of constraints and factors that may affect the property. Stream setback policies that apply to a large number of parcels with varying characteristics require a clear and practical set of setback exceptions. Exceptions will be used in a minority of cases where special circumstances apply that limit or restrict the ability of a landowner to fully apply the stream setback.

**Extinct species.** A species no longer in existence.

**Extirpated species.** A species no longer surviving in regions that were once part of its range.

**Geographic Information Systems (GIS).** Computer-based mapping technology that manipulates geographic data in digital layers and facilitates a wide array of environmental analyses.

**Greenline.** San José's urban growth boundary, beyond which urban development is prohibited (City of San José 2005).

**Habitat.** The environmental conditions that support occupancy of a given organism in a specified area (Hall et al. 1997). In scientific and lay publications, habitat is defined in many different ways and for many different purposes. For the purposes of the Plan, habitat is defined as the specific places where the environmental conditions (i.e., physical and biological conditions) are present that are required to support occupancy by individuals or populations of a given species. Habitat may be occupied (i.e., individuals or a population of the species are or have recently been present) or unoccupied. See also *Unoccupied habitat*.

**Habitat creation.** The manipulation of the physical, chemical, or biological characteristics present to develop a land cover type in an area that did not previously support it. Similar to restoration, creation results in establishment of new ecological function, value, and acreage of a natural community or land cover types.

**Habitat enhancement.** The manipulation of the physical, chemical, or biological characteristics of a land cover type to heighten, intensify, or improve one or more specific existing ecological function(s). Enhancement results in the gain of selected existing ecological function(s), but may also lead to a decline in other ecological function(s). Habitat enhancement implemented in the Reserve System will result in an increase or improvement in specific ecological function without a change in the amount of land cover types.

**Habitat quality.** The ability of the environment to provide conditions that support the persistence of individuals and populations (Hall et al. 1997). The precise meaning of habitat quality varies by species and depends on the subject species' specific needs in the context of a particular area. High-quality habitat for some species comprises only foraging and resting elements; for others it comprises foraging, resting, and nesting elements; for still others it may encompass all elements needed for the species to complete its lifecycle. Low-quality habitat would include only the minimal elements that support occurrence of the species. High-quality habitat tends to support larger numbers of species than low-quality habitat.

**Habitat restoration.** The manipulation of the physical, chemical, or biological characteristics of a site with the goal of returning natural or historic functions to a site that historically supported such functions, but no longer does because of the loss of one or more required ecological factors or as a result of past disturbance.

**Harass.** An intentional or negligent act or omission that creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding, or sheltering (50 Code of Federal Regulations 17.3). One component of the legal definition of "take" under the federal Endangered Species Act.

**Harm.** An act that kills or injures wildlife. Such an act may include significant habitat modification or degradation which results in injury of or death to wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering (50 Code of Federal Regulations 17.3). Harm is one component of the legal definition of "take" under the federal Endangered Species Act.

**Hydrology.** The movement of surface and subsurface water flows in a given area. The hydrology of an area is intimately connected with its precipitation, soils, and topography.

**Impacts.** Those actions affecting biological resources, specifically undeveloped land cover types and covered species, in the permit area. Impacts can be direct or indirect; they can also be cumulative.

**Implementing Entity.** The Implementing Entity is the agency or organization that will be responsible for fully implementing the Plan. The Implementing Entity will be identified later in the planning process.

**In-stream.** The stream bed and bank and the adjacent riparian corridor.

**Incidental take.** Any take otherwise prohibited, if such take is incidental to and not the purpose of the carrying out of an otherwise lawful activity (50 Code of Federal Regulations 17.3).

**Intermittent stream.** A stream that is supplied by both rainfall runoff and groundwater. Intermittent streams tend to be seasonal, with flow during the rainy season and into the late spring or early summer.

**Indicator species.** A species, the presence or absence of which is indicative of a particular habitat, community, or set of environmental conditions (Lincoln et al. 1998).

**Indirect impacts.** Defined by USFWS as “those that are caused by the proposed action and are later in time, but are still reasonably certain to occur” (50 CFR 402.02). Indirect impacts in the context of this Plan also include those impacts that occur at the time of the proposed action but beyond the footprint of a project or activity (i.e., beyond the area of land cover disturbance). While more difficult to detect and track, indirect impacts can undermine species viability or habitat quality, especially if multiple indirect or direct impacts work cumulatively to impair the species or to degrade the habitat.

**Interim project.** A project within the Plan study area that is proposed before adoption of the Plan and that has the potential to conflict with preliminary conservation objectives stated in the Planning Agreement.

**Invasive species.** A species that is non-native to the ecosystem and whose introduction causes or is likely to cause economic or environmental harm or harm to human health (Atkinson et al. 2004; Executive Order 13112).

**In-kind/like-value creation.** Establishing a vegetative community or habitat that would provide the same ecological values over time as the vegetation community or habitat affected. For example, creating an artificial vernal pool that supports species similar to those found in an affected vernal pool would be in-kind/like-value creation.

**Intermittent stream.** A stream that is supplied by both rainfall runoff and groundwater. Intermittent streams tend to be seasonal, with flow during the rainy season and into the late spring or early summer.

**Keystone predator.** The dominant predator, often the top predator in a given food web; a predator having a major influence on community structure, often in excess of that expected from its relative abundance (Lincoln et al. 1998).

**Keystone species.** A species whose impacts on its community or ecosystem are large, and much larger than would be expected from its abundance (Groom et al. 2006).

**Land-cover type.** The dominant feature of the land surface discernible from aerial photographs and defined by vegetation, water, or human uses.

**Land-use designation.** The designation, by parcel, in an adopted city or county General Plan of the allowable uses.

**Local Partners.** The jurisdictions preparing the Plan and applying as Permittees: the County of Santa Clara, Cities of Gilroy, Morgan Hill, and San José; Santa Clara Valley Water District; and the Santa Clara Valley Transportation Authority. Also referred to as *Local Agencies* in the Planning Agreement.

**Metapopulation.** A group of partially isolated populations belonging to the same species that are connected by pathways of immigration and emigration. Exchange of individuals occurs between such populations, enabling recolonization of sites from which the species has recently become extirpated (Lincoln et al. 1998).

**Mitigation.** Actions or project design features that reduce environmental impacts by avoiding, minimizing, or compensating for adverse effects (Fulton 1999).

**Natural community.** A collection of species that co-occur in the same habitat or area and interact through trophic and spatial relationships. Communities are typically characterized by reference to one or more dominant species.

**Non-native species.** A species that is not native to the ecosystem under consideration.

**“No surprises assurances.”** Assurances to permit holders that if unforeseen circumstances arise, the U.S. Fish and Wildlife Service will not require more land, water, or money or additional restrictions on the use of land, water, or other natural resources beyond the level stated in the Habitat Plan without the consent of the Permittee (63 Federal Register 35, February 23, 1998). Applies as long as Permittee is implementing terms and conditions of the Habitat Plan properly. See also *Unforeseen circumstances*.

**Occurrence, plant.** A group of individuals of the same species or subspecies that are separated by at least 0.25 mile from other groups of individuals of the same species or subspecies.

**Open water.** Aquatic habitats such as lakes, reservoirs, water-treatment ponds, sloughs, and ponds (including percolation and stock ponds) that do not support emergent vegetation. Open water habitat in the study area is classified as pond or reservoir. Open water is used in the Plan to refer to land cover types collectively. Alternatively, ponds and reservoirs may be called out individually.

**Out-of-kind/like-value creation.** Establishing a similar, but not identical, vegetative community or habitat which over time, develops some of the same ecological functions and values as the affected vegetative community or habitat.

**Participating special entity.** A public agency such as a water, school, irrigation, transportation, or other special district that is not subject to the jurisdiction of the Permittees but requests and receives coverage under the Plan during implementation according to the terms of the Plan.

**Perennial stream.** A stream with year-round surface flow that is supplied by both rainfall runoff and groundwater, as well as by substantial dry-season inputs (e.g., runoff).

**Perennial wetlands.** These wetlands have permanent water sources during the dry season in an otherwise arid landscape and thus function as essential habitat for a wide variety of water-dependant wildlife.

**Performance indicator.** An environmental variable that is quantitatively measured over time to determine whether enhanced, created, or restored natural communities have successfully met Habitat Plan biological goals and objectives.

**Performance objective.** In monitoring, the optimal desired value for each performance indicator. Performance objectives establish a higher threshold for each indicator than that established for performance standards. Funding, design, and management objectives for enhanced, created, or restored natural communities are established at levels that are designed to ensure that the performance objectives are achieved. Failure to meet a performance objective would not constitute a changed circumstance or require remedial measures.

**Performance period.** In monitoring, the time over which performance standards must be met.

**Performance standard.** In monitoring, a minimum requirement necessary to achieve biological goals and objectives. Failure to achieve a performance standard could constitute a changed circumstance and require that remedial measures be implemented.

**Permanent impacts.** Direct impacts that permanently remove or alter a land cover, or that affect a land cover for more than one year during covered activity implementation and/or more than one year after completion of the covered activity (e.g., creating a new road through grassland). Permanent impacts also include indirect impacts to wetlands that result in a permanent (i.e., more than one year after completion of the covered activity) change to wetland functions (e.g., development around a wetland that reduces the surface water supply to a wetland that subsequently results in a reduction in the size of the wetland). Impacts that result in reduction of long-term viability of a plant occurrence are also considered permanent.

**Permittees.** The jurisdictions and agencies applying to the Wildlife Agencies for endangered species permits: the County of Santa Clara; Cities of Gilroy, Morgan Hill, and San José; Santa Clara Valley Water District; and the Santa Clara Valley Transportation Authority. See also *Local Partners*.

**Permit Term.** For the Habitat Plan, the length of time for which the incidental take permits are valid and during which Permittees (see also *Permittees*) may undertake activities covered by the permit. The permit term is also the time period in which all land acquisition, habitat restoration, and other mitigation and conservation actions must be accomplished. The permit term of the Habitat Plan is 50 years.

**Planning Agreement.** Document executed by the County of Santa Clara; Cities of Gilroy, Morgan Hill, and San José; Santa Clara Valley Water District; the Santa Clara Valley Transportation Authority; California Department of Fish and Game; and the U.S. Fish and Wildlife Service pursuant to the Natural Community Conservation Planning Act to guide the preparation of the Habitat Plan. It defines the parties' goals and obligations with regard to development of a legally sufficient and approvable Plan that will form the basis for take permits for covered activities and covered species.

**Planning surveys.** Surveys conducted by applicants for Habitat Plan coverage and used in the project-planning process to identify constraints and determine which Habitat Plan conservation actions are applicable. Planning surveys also include surveys conducted by the Implementing Entity on potential reserve lands to evaluate whether these lands will meet Plan requirements. See also *Implementing Entity*.

**Ponds.** Small (less than 20 acres) perennial or seasonal water bodies with little or no vegetation. If vegetation is present, it is typically submerged or floating. Ponds may occur naturally or may be created or expanded for livestock use (stock ponds). All ponds discernible on aerial photographs were mapped.

**Population.** A group of individuals of the same species inhabiting a given geographic area, among which mature individuals reproduce or are likely to reproduce. Ecological interactions and genetic exchange are more likely among individuals within a population than among individuals of separate populations of the same species.

**Practicable.** Referring to an action, available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purpose (45 Federal Register 85344, December 24, 1980: U.S. Environmental Protection Agency, Part 40 Code of Federal Regulations 230.3, Definitions).

**Preconstruction surveys.** Surveys conducted for certain biological resources immediately prior to construction, by applicants for Habitat Plan coverage, to ensure that species are adequately protected and that habitat avoidance and minimization measures can be effectively implemented during construction of covered projects or implementation of covered activities.

**Preservation.** Preventing changes in land use from a natural state by, for example, acquiring land or a conservation easement.

**Protect habitat.** To maintain existing or enhanced species habitat through acquisition of land or water bodies in fee title or with conservation easements, or other mechanisms for bringing unprotected sites under permanent protected status.

**Reach.** A section of a stream. Reaches are defined based on a specific need (e.g., monitoring) and do not necessarily reflect a standard set of characteristics.

**Range.** The geographic area a species is known or believed to occupy.

**Recovery.** The process by which the decline of an endangered or threatened species is arrested or reversed or threats to its survival neutralized so that its long-term survival in nature can be ensured. Recovery entails actions to achieve the conservation and survival of a species (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1996), including actions to prevent any further erosion of a population's viability and genetic integrity, as well as actions to restore or establish environmental conditions that enable a species to persist (i.e., the long-term occurrence of a species through the full range of environmental variation).

**Recovery plan.** A document published by the U.S. Fish and Wildlife Service or by the National Marine Fisheries Service that lists the status of a listed species and the actions necessary to remove the species from the endangered species list.

**Recovery goal.** An established goal, usually quantitative, in a U.S. Fish and Wildlife Service or National Marine Fisheries Service recovery plan that identifies when a listed species is restored to a point at which the protections of the federal Endangered Species Act are no longer required.

**Reserves.** Discrete areas of conserved natural communities managed as single units under the Plan.

**Reserve System.** All Plan reserves considered collectively.

**Reservoirs.** Large open water bodies, greater than 20 acres that are highly managed for water storage, water supply, flood protection, or recreational uses.

**Restore.** See *Habitat Restoration*.

**Restoration.** See *Habitat Restoration*.

**Riparian habitat or vegetation.** Vegetation associated with river, stream, or lake banks and floodplains. Also defined by U.S. Fish and Wildlife Service (1997) as: Plant communities contiguous to and affected by surface and subsurface hydrologic features of perennial or intermittent lotic and lentic water bodies (i.e., rivers, streams, lakes, or drainage ways). Riparian areas have one or both of the following characteristics: 1) distinctively different vegetation than adjacent areas, 2) species similar to adjacent areas but exhibiting more vigorous or robust growth forms due to the greater availability of surface and subsurface water.

**Ruderal.** A species or plant community that occurs on a highly disturbed site.

**Seasonal wetlands.** Freshwater wetlands that support ponded or saturated soil conditions during winter and spring and are dry through the summer and fall until the first substantial rainfall.

**Signature.** Characteristic value, color, or texture on an aerial photograph that correlates to a particular land-cover type.

**Special-status species.** Plants and animals that are legally protected under the federal and State Endangered Species Acts, or other regulations, and species that are considered sufficiently rare by the scientific community to qualify for such listing.

**Sphere of influence.** Line determined by the Local Area Formation Committee (LAFCO) indicating the probable ultimate physical boundaries and service area of a local government agency.

**Stream.** A watercourse that flows at least periodically or intermittently through a bed or channel having banks. This may include watercourses having a surface or subsurface flow that supports or has supported riparian vegetation, fish or other aquatic life. In the context of the Habitat Plan, a watercourse must meet SCVWD “*Criteria to Verify or Identify a Watercourse as a Stream*” (Santa Clara Valley Water Resources Protection Collaborative 2006) to qualify as a stream.

**Study area.** Geographic area studied by the Plan.

**Succession.** The change in the composition and structure of a biological community over time. Successional patterns often shift dramatically following a major disturbance (e.g., fire, flood, anthropogenic clearing of land).

**Suitable habitat.** Habitat that exhibits the characteristics necessary to support a given species.

**Take.** According to the federal Endangered Species Act (16 U.S. Government Code 1532 [19]), *take* means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. According to California Fish and Game Code (California Fish and Game Code Section 86), *take* means to hunt, pursue, catch, capture, or kill, or to attempt to hunt, pursue, catch, capture, or kill.

**Temporary impacts.** Direct impacts that alter land cover for less than one year and that allow the disturbed area to recover to pre-project or ecologically improved<sup>1</sup> conditions within one year (e.g., prescribed burning, construction staging areas) of completing construction. For the purposes of this Plan, all impacts associated with covered activities that have a duration exceeding one year or that take more than one year to restore immediately following construction will be considered permanent<sup>2</sup>.

**Threatened species.** A native species, subspecies, variety, or distinct population segment (DPS) of an organism that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future throughout all of a significant portion of its range (16 U.S. Government Code 1532 [5], California Fish and Game Code Section 2067).

<sup>1</sup> *Ecologically improved* means that the site functions ecologically better than the functions present on the site prior to ground disturbance.

<sup>2</sup> The Plan encourages on-site restoration by allowing project proponents to pay temporary impact fees when sites are restored to pre-project or ecologically improved conditions within 5 years of the end of the covered activity (see Chapter 9 for additional details).

**Unoccupied habitat.** Habitat that exhibits all the constituent elements necessary for a species, but which surveys have determined is not currently occupied by that species. The lack of individuals or populations in the habitat is assumed to be the result of reduced numbers or distribution of the species such that some habitat areas are unused. It is expected that these areas would be used if species numbers or distribution were greater. See also *suitable habitat*.

**Unforeseen circumstances.** Changes in circumstances affecting a covered species or geographic area covered by the Habitat Plan that could not reasonably have been anticipated by the plan developers, and that result in a substantial and adverse change in the status of a covered species. Under the state permit, this refers to changes affecting one or more species, habitat, natural community, or the geographic area covered by a conservation plan that could not reasonably have been anticipated at the time of plan development, and that result in a substantial adverse change in the status of one or more covered species.

**Urban growth boundary (UGB).** An officially adopted and mapped line dividing land to be developed from land to be protected for natural or rural uses, including agriculture. UGBs are regulatory tools, often designated for 20 or more years to provide greater certainty for both development and conservation goals.

**Urban limit line (ULL).** The line that separates current and future urban areas from rural areas. The urban line limit is a longer-term version of the urban growth boundary and is intended to reflect the City of Morgan Hill's long-term policy for growth, beyond the twenty-year timeframe of the urban growth boundary. The purpose of the urban limit line is to encourage more efficient growth patterns, minimize public costs, and protect environmental resources. Some, but not all, of the land outside the urban limit line has been identified as greenbelt. This line is defined as the limits of urban growth for Morgan Hill in the Habitat Plan.

**Urban service area.** The area within a city's sphere of influence where utilities such as gas, water, sewer, and electricity, and public services such as police, fire, schools, and parks and recreation are and will be provided.

**Watercourse.** A body of water that flows at least periodically or intermittently through a bed or channel having banks. This may include bodies of water having a surface or subsurface flow that supports or has supported riparian vegetation, fish or other aquatic life.

**Wetland(s).** Areas subject to seasonal or perennial flooding or ponding, or that possess saturated soil conditions and that support predominantly hydrophytic or "water-loving" herbaceous plant species. Within the plan area, wetland habitats are identified as coastal and valley freshwater marsh (i.e., perennial wetlands) or seasonal wetlands. The term wetland(s) is used to refer to all wetland types.

**Wildland-urban interface.** The area where structures and other human development meet or intermingle with undeveloped wildland (University of Wisconsin n.d.).

**Wildlife Agencies.** U.S. Fish and Wildlife Service and California Department of Fish and Game.

# Implementing Agreement

SANTA CLARA VALLEY HABITAT PLAN

IMPLEMENTING AGREEMENT

August 14, 2012

## TABLE OF CONTENTS

<b>Santa Clara Valley Habitat Plan .....</b>	<b>1</b>
<b>Implementing Agreement .....</b>	<b>1</b>
<b>Table of Contents .....</b>	<b>2</b>
<b>EXHIBITS TO AGREEMENT: .....</b>	<b>10</b>
<b>EXHIBIT A – COVERED SPECIES .....</b>	<b>10</b>
<b>EXHIBIT B – MODEL IMPLEMENTING ORDINANCE .....</b>	<b>10</b>
<b>Agreement.....</b>	<b>11</b>
<b>1. Parties.....</b>	<b>11</b>
<b>2. Recitals .....</b>	<b>11</b>
<b>3. Definitions.....</b>	<b>13</b>
<b>3.1. “Agreement” means this Implementing Agreement. ....</b>	<b>13</b>
<b>3.2. “Annual Report” means the Annual Report prepared by the Implementing Entity about implementation of the SCVHP, as provided in Agreement Section 14 and further described in SCVHP Chapter 8.11.....</b>	<b>13</b>
<b>3.3. “Authorized Take” means the extent of incidental Take of Covered Species authorized by USFWS in the Federal Permit issued to the Permittees pursuant to Section 10(a)(1)(B) of the ESA, and the extent of Take of Covered Species authorized by CDFG in the State Permit issued to the Permittees pursuant to California Fish and Game Code section 2835. ....</b>	<b>13</b>
<b>3.4. “CDFG” means the California Department of Fish and Game, a department of the California Resources Agency. ....</b>	<b>13</b>
<b>3.5. “CEQA” means the California Environmental Quality Act (Pub. Resources Code §21000 et seq.) and all rules, regulations and guidelines promulgated pursuant to that Act. ....</b>	<b>13</b>
<b>3.6. “CESA” means the California Endangered Species Act (Fish &amp; G. Code, §2050 et seq.) and all rules, regulations and guidelines promulgated pursuant to that Act. ....</b>	<b>13</b>
<b>3.7. “Changed Circumstances” as defined at 50 C.F.R. §17.3 means changes in circumstances affecting a Covered Species or the geographic area covered by the SCVHP that can reasonably be anticipated by the Parties and that can reasonably be planned for in the SCVHP. Changed Circumstances and planned responses to Changed Circumstances are more particularly defined in Agreement Section 11.3 and SCVHP Chapter 10.2.1. Changed Circumstances do not include Unforeseen Circumstances.....</b>	<b>13</b>
<b>3.8. “Chapter” means a chapter, subchapter, or section of the SCVHP.....</b>	<b>13</b>
<b>3.9. “Conditions” or “Conditions on Covered Activities” means the avoidance and minimization measures described in SCVHP Chapter 6, and the requirement to pay certain</b>	

fees, or to provide land or implement conservation actions in lieu of such fees, described in SCVHP Chapter 9, which will be incorporated in Covered Activities, as provided in Agreement Section 8.....	13
3.10. “Conserve,” “Conserving,” or “Conservation” means to use, and the use of, methods and procedures within the SCVHP Permit Area that are necessary to bring the federally and state-listed Covered Species to the point at which the measures provided pursuant to the ESA and CESA are not necessary, and to maintain or enhance the condition of the non-listed Covered Species so that listing pursuant to the ESA and CESA will not become necessary.....	14
3.11. “Conservation Measure” means each action detailed in SCVHP Chapter 5 that is a component of the Conservation Strategy.....	14
3.12. “Conservation Strategy” or “SCVHP Conservation Strategy” means the conservation strategy described in SCVHP Chapter 5.....	14
3.13. “Covered Activities” means the otherwise lawful activities and projects described in SCVHP Chapter 2.3 that the Permittees or Third Party Participants may implement in the Permit Area for which incidental Take is authorized by the Wildlife Agencies pursuant to the Permits.	14
3.14. “Covered Species” means the species, listed and non-listed, whose conservation and management are provided for in the SCVHP and for which incidental Take is authorized by the Wildlife Agencies pursuant to the Permits. Covered Species are listed in Exhibit A to this Agreement. ....	14
3.15. “Effective Date” means the date of the first business day after all of the following have occurred: execution of this Agreement by all Parties; issuance of both of the Permits; adoption of an SCVHP implementing ordinance by each of the Cities and the County, as provided in Agreement Section 17.1, and formation of the Implementing Entity described in 3.21 of the Agreement.....	14
3.16. “Evaluation Checklist” means the checklist prepared by the Implementing Entity to guide the County and the Cities’ review of habitat plan application packages submitted by private project proponents.....	14
3.17. “Federal Listed Species” means the Covered Species that are listed as threatened or endangered species under the ESA as of the Effective Date, and the Covered Species that are listed as threatened or endangered pursuant to the ESA during the term of the SCVHP as of the date of such listing. ....	14
3.18. “Federal Permit” means the federal incidental take permit issued by USFWS to the Permittees based on the SCVHP pursuant to Section 10(a)(1)(B) of the ESA.....	14
3.19. “ESA” means the Federal Endangered Species Act of 1973, as amended (16 U.S.C § 1531 et seq.) and all rules, regulations and guidelines promulgated pursuant to that Act.	14
3.20. “Fully Protected Species” means any species identified in California Fish and Game Code sections 3511, 4700, 4800, 5050 or 5515. ....	14

- 3.21. **“Implementing Entity”** means the Santa Clara Valley Habitat Agency, a joint exercise of powers agency composed of the County and the Cities, formed pursuant to the Joint Powers Act, Gov. Code § 6500 et seq. .... 15
- 3.22. **“Independent Conservation Assessment Team”** means the Independent Conservation Assessment Team as provided in Agreement Section 11.2.3 and further described in SCVHP Chapter 7.2.3. .... 15
- 3.23. **“Listed Species”** means a species (including a subspecies, or a distinct population segment of a species) that is listed as an endangered or threatened species under the ESA or as an endangered, threatened or candidate species under CESA. .... 15
- 3.24. **“Migratory Bird Treaty Act”** means the federal Migratory Bird Treaty Act (16 U.S.C. §703 et seq.) and all rules, regulations and guidelines promulgated pursuant to that Act. 15
- 3.25. **“NCCPA”** means the California Natural Community Conservation Planning Act (Fish & G. Code, §2800 et seq.), as amended on January 1, 2012, and all rules, regulations and guidelines promulgated pursuant to that Act. .... 15
- 3.26. **“NEPA”** means the National Environmental Policy Act (42 U.S.C. §4321 et seq.) and all rules, regulations and guidelines promulgated pursuant to that Act. .... 15
- 3.27. **“Neighboring Landowner”** means an owner of specific types of agricultural lands that are within one mile of lands included in the Reserve System who has received a special certificate (Exhibit C) from the Implementing Entity pursuant to Agreement Section 7.4.3 that extends Authorized Take coverage for certain Covered Species resulting from certain agricultural land uses. .... 15
- 3.28. **“Non-listed Species”** means a species (including a subspecies, or a distinct population segment of a species) that is not listed as endangered or threatened under the ESA or as an endangered, threatened, or candidate species under CESA. .... 15
- 3.29. **“Participating Special Entity”** means an entity that is not subject to the City’s or the County’s land use or other regulatory authority that has entered into a special agreement with the Implementing Entity pursuant to Agreement Section 7.4.2 to receive Authorized Take coverage for a project or activity within the Permit Area..... 15
- 3.30. **“Party” and “Parties”** mean the signatories to this Agreement, individually and collectively. .... 15
- 3.31. **“Permit Area”** means the area within which the Permittees are seeking authorization from the Wildlife Agencies for the Take of Covered Species resulting from Covered Activities. The Permit Area is further described in SCVHP Chapter 1.2.2 and is depicted in Figure 1-2 of the SCVHP. .... 15
- 3.32. **“Permits”** means the Federal Permit and the State Permit, which incorporate the SCVHP and the Agreement by reference. .... 15

- 3.33. **“Permittees” means the Implementing Entity, County, Cities, Water District, and VTA. 15**
- 3.34. **“Planning Agreement” means the document executed in 2005, by the County, the Cities, the Water District, the VTA, USFWS and CDFG pursuant to the NCCPA to guide the preparation of the SCVHP. .... 16**
- 3.35. **“Planning Limit of Urban Growth” means the geographical extent of Authorized Take coverage for urban development as described in SCVHP Chapter 2.2.3 and further explained in SCVHP Chapter 2.2.1, and as delineated in Figure 2-2 of the SCVHP. .... 16**
- 3.36. **“Private Project Participant” means a private person or entity that has received Take Authorization coverage from a City or the County pursuant to Agreement Section 7.4.1 for a project or activity within the Permit Area that is subject to the land use or other regulatory authority of the City or the County. .... 16**
- 3.37. **“Reserve Unit Management Plan” means a Reserve Unit Management Plan as provided in Agreement Section 10.1 and as further described in SCVHP Chapter 5.2.5. .... 16**
- 3.38. **“Reserve System” means the land acquired and dedicated in perpetuity through either a fee interest or conservation easement intended to meet the preservation, conservation, enhancement and restoration objectives of the Conservation Strategy of the SCVHP. The Reserve System may also include up to one thousand (1,000) acres of land owned by the Santa Clara Valley Open Space Authority as of the Effective Date, on which the recordation of a conservation easement is precluded by law, without recordation of a conservation easement, provided the lands otherwise meet the requirements for Reserve System lands as further described in SCVHP Chapter 5.2.3 and SCVHP Chapter 9.4.2. .... 16**
- 3.39. **“SCVHP” and “Plan” mean the joint habitat conservation plan and natural community conservation plan prepared by the Permittees and approved by the Wildlife Agencies under Section 10 of the ESA and Section 2820 of the California Fish and Game Code. 16**
- 3.40. **“SCVHP Fees” means the Land Cover Fee, the Serpentine Fee, the Nitrogen Deposition Fee, the Endowment Fee Component, the Plan Preparation Cost Recovery Fee Component, the Wetland Fee, the Temporary Impact Fee, and the Burrowing Owl Fee, as further described in SCVHP Chapter 9.4.1. .... 16**
- 3.41. **“Section” means a section or subsection of this Agreement. .... 16**
- 3.42. **“State Listed Species” means the Covered Species that are listed as threatened or endangered species, or a candidate for such status, under CESA, as of the Effective Date, and the Covered Species that are listed as threatened or endangered, or a candidate for such status pursuant to CESA during the term of the SCVHP, as of the date of such listing. .... 16**
- 3.43. **“State Permit” means the state Take permit issued to the Permittees based on the SCVHP pursuant to Section 2835 of the California Fish and Game Code. .... 16**

3.44.	“Take” and “Taking” have the same meaning provided by the ESA and its implementing regulations with regard to activities subject to the ESA, and also have the same meaning provided in section 86 of the California Fish and Game Code with regard to activities subject to CESA and NCCPA. ....	16
4.	Purposes of this Agreement.....	17
5.	Incorporation.....	18
5.1	Incorporation of the Plan .....	18
5.2	Incorporation into the Permits .....	18
6.	Implementation Roles and Responsibilities.....	18
6.1.	Permittees’ Responsibilities .....	18
6.2.	USFWS Responsibilities .....	18
6.3.	CDFG Responsibilities .....	18
6.4.	Role of Implementing Entity .....	19
6.4.1.	SCVHP Implementation Key Deadlines for Compliance.....	19
6.5.	Collaboration among the Parties.....	19
6.6.	Dispute Resolution .....	20
6.6.1.	Notice of Dispute; Meet and Confer .....	20
6.6.2.	Elevation of Dispute .....	20
7.	Take Authorization .....	21
7.1.	Issuance of the Permits.....	21
7.2.	Ongoing Role of Wildlife Agencies .....	21
7.3.	Authorized Take for Projects and Activities Implemented by Permittees .....	22
7.4.	Extension of Take Authorization to Third Party Participants.....	22
7.4.1.	Private Project Participants.....	23
7.4.1.1.	SCVHP Application Process .....	23
7.4.1.2.	Extension of Authorized Take Coverage to Private Project Participants .....	23
7.4.1.3.	SCVHP Implementing Ordinances.....	24
7.4.2.	Participating Special Entities.....	25
7.4.3.	Neighboring Landowners.....	25
7.4.3.1.	Activities Covered by Neighboring Landowner Take Authorization.....	26
7.4.3.2.	Limitations of Neighboring Landowner Take Authorizations .....	26

7.4.3.3.	Neighboring Landowner Certificates of Inclusion .....	26
7.5.	Contra Costa Goldfields.....	27
7.6.	The Migratory Bird Treaty Act.....	27
7.7.	Activities Not Covered .....	27
7.8.	Relationship of SCVHP to Three Creeks Habitat Conservation Plan .....	27
8.	Conditions on Covered Activities .....	28
8.1.	Avoidance and Minimization of Impacts .....	28
8.1.1.	Avoidance and Minimization of Impacts to Species Protected under Laws other than the ESA or CESA.....	29
8.1.2.	Exemptions from Conditions to Avoid and Minimize Impacts.....	29
8.2.	SCVHP Fees .....	29
8.2.1.	Exemptions from SCVHP Fees.....	30
8.2.2.	Payment and Collection of Fees .....	30
8.3.	SCVHP Fee Credits.....	30
8.4.	Timing of Fee Payment.....	31
8.5.	Adjustment of Fees .....	31
9.	Creation of Reserve System.....	32
9.1.	Criteria for Reserve System Lands.....	32
9.2.	Permanent Protection of Reserve System Lands.....	33
9.2.1.	Conservation Easements .....	33
9.3.	Requirement for a Reserve Unit Management Plan .....	34
9.4.	Stay-Ahead or Rough Proportionality Requirement.....	34
9.4.1.	Reserve System Lands Acquired Using State or Federal Funding .....	35
9.4.2.	Failure to Stay Ahead or to Maintain Rough Proportionality .....	35
9.4.2.1.	NCCPA Procedure for Addressing Failure to Maintain Rough Proportionality .....	35
9.4.3.	Conveyance of Land in Lieu of SCVHP Fees to Maintain Rough Proportionality ....	36
9.5.	Additional Criteria for Lands Conveyed in Lieu of SCVHP Fees.....	37
9.6.	Lands Conveyed by Entities other than Permittees.....	37
9.6.1.	Lands in Private Mitigation Banks .....	37
9.7.	Gifts of Land .....	37
10.	Management of Reserve System Lands .....	37

10.1.	Reserve Unit Management Plans .....	38
10.1.1.	Role of the Wildlife Agencies in Preparation of Reserve Unit Management Plans .....	38
10.1.2.	Preparation and Revision of Reserve Unit Management Plans .....	38
10.2.	Reserve Unit Management Plan Components .....	39
10.3.	Recreational Uses .....	39
10.4.	Monitoring Program .....	39
10.5.	Technical Advisory Committee .....	39
11.	Monitoring, Adaptive Management and Changed Circumstances .....	39
11.1.	Monitoring .....	40
11.2.	Adaptive Management .....	40
11.2.1.	Role of the Wildlife Agencies .....	41
11.2.2.	Role of Science Advisors .....	41
11.2.3.	Role of the Independent Conservation Assessment Team .....	41
11.2.4.	Advice from Other Land Management Agencies .....	42
11.2.5.	Advice from the Public .....	42
11.2.6.	No Increase in Take .....	42
11.3.	Changed Circumstances .....	42
11.3.1.	Initiating Responses to Changed Circumstances .....	42
12.	Regulatory Assurances .....	43
12.1.	ESA Regulatory Assurances .....	43
12.2.	NCCPA Regulatory Assurances .....	43
12.3.	Interim Obligations upon a Finding of Unforeseen Circumstances .....	44
12.4.	Section 7 Consultations regarding Covered Activities .....	44
12.5.	Assurances for Third Party Participants .....	44
13.	Funding .....	45
13.1.	Funding for Management and Monitoring in Perpetuity .....	45
13.2.	Effect of Inadequate Funding .....	45
13.3.	State and Federal Funding .....	46

# AGREEMENT

## 1. PARTIES

This Implementing Agreement (“**Agreement**”), made and entered into by and among the United States Fish and Wildlife Service (“**USFWS**”) of the United States Department of the Interior, the California Department of Fish and Game (“**CDFG**”) of the State of California Natural Resources Agency, the Santa Clara Valley Habitat Agency (the “**Implementing Entity**”), the County of Santa Clara (“**County**”), the City of San Jose (“**San Jose**”), the City of Gilroy (“**Gilroy**”), the City of Morgan Hill (“**Morgan Hill**”), the Santa Clara Valley Water District (“**Water District**”), and the Santa Clara Valley Transportation Authority (“**VTA**”) governs the implementation of the joint habitat conservation plan and natural community conservation plan for the Santa Clara Valley (the “**Santa Clara Valley Habitat Plan**,” the “**Plan**,” or the “**SCVHP**”) as of the Effective Date.

These entities may be referred to collectively as the “**Parties**” and individually as a “**Party**.” The USFWS and CDFG may be referred to collectively as the “**Wildlife Agencies**.” San Jose, Gilroy, and Morgan Hill may be referred to collectively as the “**Cities**” and each individually as a “**City**.” The Implementing Entity, County, Cities, Water District, and VTA may be referred to collectively as the “**Permittees**” and each individually as a “**Permittee**.”

## 2. RECITALS

The Parties have entered into this Agreement in consideration of the following:

**2.1.** In 2001, the preparation of a habitat conservation plan was included as an element of the project description used for a USFWS biological opinion for the Coyote Valley Research Park and four other projects. The habitat conservation plan was included to address the cumulative and indirect effects of urban growth, infrastructure development and operations and maintenance activities in Santa Clara County. In 2004, the County, San Jose, the Water District and the VTA entered into a Memorandum of Understanding that stated their shared intent to develop a joint habitat conservation plan and natural community conservation plan that would address certain existing and future environmental regulatory requirements for their various activities, including requirements pertaining to cumulative and indirect effects.

**2.2.** In 2005, the County, the Cities, the Water District, the VTA, USFWS and CDFG entered into a planning agreement pursuant to the California Natural Community Conservation Planning Act (the “**Planning Agreement**”). The Planning Agreement identified guidelines, criteria and procedures for the preparation of a joint habitat conservation plan and natural community conservation plan that would provide for the comprehensive management and conservation of numerous wildlife species. The SCVHP has been prepared according to the process described in the Planning Agreement.

**2.3.** The SCVHP is a plan to protect and enhance ecological diversity and function in a substantial portion of Santa Clara County, while allowing appropriate and compatible growth and development to occur in accordance with certain environmental laws. The Plan includes measures that provide for the conservation and management of certain “covered” species, and that avoid, minimize, and mitigate impacts on the “covered” species and their habitat resulting from various public and private activities, including urban growth and a variety of road, water, and other needed infrastructure construction and maintenance activities. The primary goal of the Plan is to fulfill the requirements of the federal Endangered Species Act and the California Natural Community Conservation Planning Act in order to obtain authorizations for the incidental take of certain covered species that may result from these activities.

**2.4.** The federal Endangered Species Act (“ESA”) prohibits the “take” of species listed as endangered or threatened under the ESA, as take is defined under federal law. Under Section 10 of ESA, USFWS may issue a permit authorizing the incidental take of endangered or threatened species during otherwise lawful activities if certain statutory requirements are met by the applicant and such take will not appreciably reduce the likelihood of the survival and recovery of the species in the wild. To obtain a federal incidental take permit, the applicant must submit a habitat conservation plan describing, among other things, the steps the applicant will take to minimize and mitigate to the maximum extent practicable the impact of such “taking.” The Permittees submitted the SCVHP to USFWS and applied for a federal permit for incidental take of certain “covered” species within the area encompassed by the Plan. The incidental take permit issued by USFWS will be issued concurrently with its execution of this Agreement.

**2.5.** Like the ESA, the California Endangered Species Act (“CESA”) prohibits the take of species listed as endangered, threatened or candidate species under CESA. The Natural Community Conservation Planning Act (“NCCPA”) allows CDFG to authorize by permit the take of any species other than mountain lions (California Fish and Game Code section 4800 et seq.), including species listed as an endangered, threatened or candidate species under CESA, where the conservation and management of the species is provided for in a natural community conservation plan approved by CDFG. Because the SCVHP was developed to meet the standards of the NCCPA, it will do more than minimize and mitigate the impacts of the activities covered in the Plan, as the ESA requires. The Plan will also contribute to the recovery of listed species and help prevent other species from becoming threatened or endangered. The Permittees submitted the SCVHP to CDFG for approval and permitting for take pursuant to NCCPA. CDFG will issue a permit based on the SCVHP concurrently with its execution of this Agreement.

**2.6.** All of the Permittees intend to receive coverage under the federal incidental take permit, and the state permit issued pursuant to the NCCPA, for certain “covered” activities that they will implement, including infrastructure projects and operations and maintenance activities. In addition, the County and the Cities intend to allow developers, infrastructure project proponents and certain landowners to receive coverage under the permits for certain development and other activities, subject to the conditions in the Permits. The Implementing Entity may also negotiate agreements with other public entities to allow certain activities of such entities to be covered by the permits, subject to the conditions in the Permits.

2.7. The Permittees are agreeing to substantial commitments of land, natural resources, financial resources, human resources and other assets to conserve and manage the "covered" species, their habitats and other natural communities, in exchange for the assurances provided by the Wildlife Agencies in this Agreement.

### 3. DEFINITIONS

The following terms as used in this Agreement will have the meanings set forth below. Terms specifically defined in applicable federal or state statutes, including but not limited to, the ESA, CESA or NCCPA or the regulations adopted by USFWS and CDFG under those statutes will have the same meaning when used in this Agreement. Definitions used in this Agreement may elaborate on, but are not intended to conflict with, such statutory or regulatory definitions.

- 3.1. **"Agreement"** means this Implementing Agreement.
- 3.2. **"Annual Report"** means the Annual Report prepared by the Implementing Entity about implementation of the SCVHP, as provided in Agreement Section 14 and further described in SCVHP Chapter 8.11.
- 3.3. **"Authorized Take"** means the extent of incidental Take of Covered Species authorized by USFWS in the Federal Permit issued to the Permittees pursuant to Section 10(a)(1)(B) of the ESA, and the extent of Take of Covered Species authorized by CDFG in the State Permit issued to the Permittees pursuant to California Fish and Game Code section 2835.
- 3.4. **"CDFG"** means the California Department of Fish and Game, a department of the California Resources Agency.
- 3.5. **"CEQA"** means the California Environmental Quality Act (Pub. Resources Code §21000 et seq.) and all rules, regulations and guidelines promulgated pursuant to that Act.
- 3.6. **"CESA"** means the California Endangered Species Act (Fish & G. Code, §2050 et seq.) and all rules, regulations and guidelines promulgated pursuant to that Act.
- 3.7. **"Changed Circumstances"** as defined at 50 C.F.R. §17.3 means changes in circumstances affecting a Covered Species or the geographic area covered by the SCVHP that can reasonably be anticipated by the Parties and that can reasonably be planned for in the SCVHP. Changed Circumstances and planned responses to Changed Circumstances are more particularly defined in Agreement Section 11.3 and SCVHP Chapter 10.2.1. Changed Circumstances do not include Unforeseen Circumstances.
- 3.8. **"Chapter"** means a chapter, subchapter, or section of the SCVHP.
- 3.9. **"Conditions"** or **"Conditions on Covered Activities"** means the avoidance and minimization measures described in SCVHP Chapter 6, and the requirement to pay certain fees, or to provide land or implement conservation actions in lieu of such fees, described in SCVHP Chapter 9, which will be incorporated in Covered Activities, as provided in Agreement Section 8.

- 3.10. **“Conserve,” “Conserving,” or “Conservation”** means to use, and the use of, methods and procedures within the SCVHP Permit Area that are necessary to bring the federally and state-listed Covered Species to the point at which the measures provided pursuant to the ESA and CESA are not necessary, and to maintain or enhance the condition of the non-listed Covered Species so that listing pursuant to the ESA and CESA will not become necessary.
- 3.11. **“Conservation Measure”** means each action detailed in SCVHP Chapter 5 that is a component of the Conservation Strategy.
- 3.12. **“Conservation Strategy” or “SCVHP Conservation Strategy”** means the conservation strategy described in SCVHP Chapter 5.
- 3.13. **“Covered Activities”** means the otherwise lawful activities and projects described in SCVHP Chapter 2.3 that the Permittees or Third Party Participants may implement in the Permit Area for which incidental Take is authorized by the Wildlife Agencies pursuant to the Permits.
- 3.14. **“Covered Species”** means the species, listed and non-listed, whose conservation and management are provided for in the SCVHP and for which incidental Take is authorized by the Wildlife Agencies pursuant to the Permits. Covered Species are listed in **Exhibit A** to this Agreement.
- 3.15. **“Effective Date”** means the date of the first business day after all of the following have occurred: execution of this Agreement by all Parties; issuance of both of the Permits; adoption of an SCVHP implementing ordinance by each of the Cities and the County, as provided in Agreement Section 17.1, and formation of the Implementing Entity described in 3.21 of the Agreement.
- 3.16. **“Evaluation Checklist”** means the checklist prepared by the Implementing Entity to guide the County and the Cities’ review of habitat plan application packages submitted by private project proponents.
- 3.17. **“Federal Listed Species”** means the Covered Species that are listed as threatened or endangered species under the ESA as of the Effective Date, and the Covered Species that are listed as threatened or endangered pursuant to the ESA during the term of the SCVHP as of the date of such listing.
- 3.18. **“Federal Permit”** means the federal incidental take permit issued by USFWS to the Permittees based on the SCVHP pursuant to Section 10(a)(1)(B) of the ESA.
- 3.19. **“ESA”** means the Federal Endangered Species Act of 1973, as amended (16 U.S.C § 1531 et seq.) and all rules, regulations and guidelines promulgated pursuant to that Act.
- 3.20. **“Fully Protected Species”** means any species identified in California Fish and Game Code sections 3511, 4700, 4800, 5050 or 5515.

- 3.21. **“Implementing Entity”** means the Santa Clara Valley Habitat Agency, a joint exercise of powers agency composed of the County and the Cities, formed pursuant to the Joint Powers Act, Gov. Code § 6500 et seq.
- 3.22. **“Independent Conservation Assessment Team”** means the Independent Conservation Assessment Team as provided in Agreement Section 11.2.3 and further described in SCVHP Chapter 7.2.3.
- 3.23. **“Listed Species”** means a species (including a subspecies, or a distinct population segment of a species) that is listed as an endangered or threatened species under the ESA or as an endangered, threatened or candidate species under CESA.
- 3.24. **“Migratory Bird Treaty Act”** means the federal Migratory Bird Treaty Act (16 U.S.C. §703 et seq.) and all rules, regulations and guidelines promulgated pursuant to that Act.
- 3.25. **“NCCPA”** means the California Natural Community Conservation Planning Act (Fish & G. Code, §2800 et seq.), as amended on January 1, 2012, and all rules, regulations and guidelines promulgated pursuant to that Act.
- 3.26. **“NEPA”** means the National Environmental Policy Act (42 U.S.C. §4321 et seq.) and all rules, regulations and guidelines promulgated pursuant to that Act.
- 3.27. **“Neighboring Landowner”** means an owner of specific types of agricultural lands that are within one mile of lands included in the Reserve System who has received a special certificate (Exhibit C) from the Implementing Entity pursuant to Agreement Section 7.4.3 that extends Authorized Take coverage for certain Covered Species resulting from certain agricultural land uses.
- 3.28. **“Non-listed Species”** means a species (including a subspecies, or a distinct population segment of a species) that is not listed as endangered or threatened under the ESA or as an endangered, threatened, or candidate species under CESA.
- 3.29. **“Participating Special Entity”** means an entity that is not subject to the City’s or the County’s land use or other regulatory authority that has entered into a special agreement with the Implementing Entity pursuant to Agreement Section 7.4.2 to receive Authorized Take coverage for a project or activity within the Permit Area.
- 3.30. **“Party”** and **“Parties”** mean the signatories to this Agreement, individually and collectively.
- 3.31. **“Permit Area”** means the area within which the Permittees are seeking authorization from the Wildlife Agencies for the Take of Covered Species resulting from Covered Activities. The Permit Area is further described in SCVHP Chapter 1.2.2 and is depicted in Figure 1-2 of the SCVHP.
- 3.32. **“Permits”** means the Federal Permit and the State Permit, which incorporate the SCVHP and the Agreement by reference.
- 3.33. **“Permittees”** means the Implementing Entity, County, Cities, Water District, and VTA.

- 3.34. **“Planning Agreement”** means the document executed in 2005, by the County, the Cities, the Water District, the VTA, USFWS and CDFG pursuant to the NCCPA to guide the preparation of the SCVHP.
- 3.35. **“Planning Limit of Urban Growth”** means the geographical extent of Authorized Take coverage for urban development as described in SCVHP Chapter 2.2.3 and further explained in SCVHP Chapter 2.2.1, and as delineated in Figure 2-2 of the SCVHP.
- 3.36. **“Private Project Participant”** means a private person or entity that has received Take Authorization coverage from a City or the County pursuant to Agreement Section 7.4.1 for a project or activity within the Permit Area that is subject to the land use or other regulatory authority of the City or the County.
- 3.37. **“Reserve Unit Management Plan”** means a Reserve Unit Management Plan as provided in Agreement Section 10.1 and as further described in SCVHP Chapter 5.2.5.
- 3.38. **“Reserve System”** means the land acquired and dedicated in perpetuity through either a fee interest or conservation easement intended to meet the preservation, conservation, enhancement and restoration objectives of the Conservation Strategy of the SCVHP. The Reserve System may also include up to one thousand (1,000) acres of land owned by the Santa Clara Valley Open Space Authority as of the Effective Date, on which the recordation of a conservation easement is precluded by law, without recordation of a conservation easement, provided the lands otherwise meet the requirements for Reserve System lands as further described in SCVHP Chapter 5.2.3 and SCVHP Chapter 9.4.2.
- 3.39. **“SCVHP”** and **“Plan”** mean the joint habitat conservation plan and natural community conservation plan prepared by the Permittees and approved by the Wildlife Agencies under Section 10 of the ESA and Section 2820 of the California Fish and Game Code.
- 3.40. **“SCVHP Fees”** means the Land Cover Fee, the Serpentine Fee, the Nitrogen Deposition Fee, the Endowment Fee Component, the Plan Preparation Cost Recovery Fee Component, the Wetland Fee, the Temporary Impact Fee, and the Burrowing Owl Fee, as further described in SCVHP Chapter 9.4.1.
- 3.41. **“Section”** means a section or subsection of this Agreement.
- 3.42. **“State Listed Species”** means the Covered Species that are listed as threatened or endangered species, or a candidate for such status, under CESA, as of the Effective Date, and the Covered Species that are listed as threatened or endangered, or a candidate for such status pursuant to CESA during the term of the SCVHP, as of the date of such listing.
- 3.43. **“State Permit”** means the state Take permit issued to the Permittees based on the SCVHP pursuant to Section 2835 of the California Fish and Game Code.
- 3.44. **“Take”** and **“Taking”** have the same meaning provided by the ESA and its implementing regulations with regard to activities subject to the ESA, and also have the same meaning

provided in section 86 of the California Fish and Game Code with regard to activities subject to CESA and NCCPA.

- 3.45. **"Third Party Participants"** means Private Project Participants, Participating Special Entities, Neighboring Landowners and other persons or entities that that are not Permittees and that receive Authorized Take coverage from a Permittee in accordance with Agreement Section 7.4.
- 3.46. **"Three Creeks Habitat Conservation Plan"** and **"3CHCP"** mean the habitat conservation plan being developed by the Santa Clara Valley Water District to protect and enhance habitats for aquatic species and provide conservation for species affected by the District's on-going water supply operations in the northern Santa Clara Valley.
- 3.47. **"Unforeseen Circumstances"** under the Federal Permit, as defined at 50 C.F.R. §17.3, means changes in circumstances affecting a Covered Species or geographic area covered by the SCVHP that could not reasonably have been anticipated by the Permittees and USFWS at the time of the SCVHP's negotiation and development, and that result in a substantial and adverse change in the status of a Covered Species. **"Unforeseen Circumstances"** under the State Permit means changes affecting one or more species, habitat, natural community, or the geographic area covered by a conservation plan that could not reasonably have been anticipated at the time of plan development, and that result in a substantial adverse change in the status of one or more Covered Species.
- 3.48. **"USFWS"** means the United States Fish and Wildlife Service, an agency of the United States Department of Interior.
- 3.49. **"Wetlands"** means the wetlands types described in SCVHP Chapter 3.3.5, including coastal and valley freshwater marsh and seasonal wetlands.
- 3.50. **"Wildlife Agencies"** means USFWS and CDFG.

#### 4. PURPOSES OF THIS AGREEMENT

This Agreement defines the Parties' roles and responsibilities and provides a common understanding of actions that will be undertaken to avoid, minimize and mitigate the effects on the Covered Species caused by the Covered Activities within the Permit Area, and to provide for the conservation of the Covered Species within the Permit Area. The purposes of this Agreement are:

- To ensure implementation of each of the terms and conditions of the Permits;
- To note the existence of long term assurances to the Permittees that, pursuant to the federal "No Surprises" provisions of 50 Code of Federal Regulations, sections 17.22(b)(5) and 17.32(b)(5), and California Fish and Game Code section 2820, subdivision (f), as long as the terms and conditions of this Agreement, the SCVHP, and the Permits are fully satisfied, the Wildlife Agencies will not require of the Permittees the commitment of additional land, water or financial compensation or additional restrictions on the use of land, water, or other natural resources, either to minimize and mitigate the impacts of Authorized Take, or to

provide for the conservation and management of the Covered Species in the Permit Area, except as provided in this Agreement and the SCVHP; and

- To describe remedies and recourse should any Party fail to perform its obligations as set forth in this Agreement.

## **5. INCORPORATION**

### **5.1 Incorporation of the Plan**

The SCVHP and each of its provisions are intended to be, and by this reference are, incorporated herein. This Agreement is intended to specify the obligations of the Parties under the SCVHP, recognizing that the SCVHP is a conservation plan and was not drafted as a contract. In the event of any direct contradiction, conflict or inconsistency between this Agreement and the SCVHP, the terms of this Agreement will control. In all other cases, the provisions of this Agreement and the SCVHP will be interpreted to be consistent with and complementary to each other.

### **5.2 Incorporation into the Permits**

This Agreement and the SCVHP shall be incorporated as terms and conditions of the Permits. In the event of any direct contradiction among the provisions of the SCVHP, the terms of this Agreement or the terms of the Permits, the terms of the Permits shall control. Each Party acknowledges that no representation, inducement, promise or agreement, oral or otherwise, has been made by the other Party or anyone acting on behalf of the other Party that is not embodied in the SCVHP, this Agreement, or the Permits.

## **6. IMPLEMENTATION ROLES AND RESPONSIBILITIES**

The general roles and responsibilities of the Parties for the implementation of the SCVHP are as follows.

### **6.1. Permittees' Responsibilities**

The Permittees will fully and faithfully perform all obligations assigned to them collectively, and to each of them individually, under this Agreement, the SCVHP, and the Permits.

### **6.2. USFWS Responsibilities**

USFWS will provide timely technical assistance and review, collaboration and consultation to the Permittees regarding implementation of the SCVHP, as provided in this Agreement and the SCVHP, throughout the duration of the Federal Permit. USFWS will also use all reasonable efforts to assist the Permittees to achieve the SCVHP conservation and recovery goals for the Covered Species, as described in SCVHP Chapters 8.7.3 and 9.4.3.

### **6.3. CDFG Responsibilities**

CDFG will provide timely technical assistance and review, collaboration and consultation to the Permittees regarding implementation of the SCVHP, as provided in this Agreement and the SCVHP,

throughout the duration of the State Permit. CDFG will also use all reasonable efforts to assist the Permittees to achieve the SCVHP conservation and recovery goals for the Covered Species, as described in SCVHP Chapters 8.7.3 and 9.4.3.

#### **6.4. Role of Implementing Entity**

The Permittees collectively are ultimately responsible for compliance with all applicable terms and conditions of the Permits. The Implementing Entity will have primary responsibility for implementing the SCVHP on behalf of the other Permittees. The Implementing Entity may delegate the implementation of specific actions to other Parties or qualified third parties, including but not limited to public agencies, private conservation organizations, university scientists, and contractors, but the Implementing Entity itself will remain responsible for ensuring overall implementation of the SCVHP on behalf of the other Permittees in accordance with the Permits. As further described in SCVHP Chapter 8.3, the Implementing Entity's responsibilities generally include, but are not necessarily limited to, implementation and management of all of the following elements of the SCVHP:

- administration of the SCVHP, including staffing, and providing necessary scientific, legal, and financial expertise and consulting services;
- oversight of compliance with the Permits;
- creation of the Reserve System;
- management of Reserve System Lands;
- monitoring, adaptive management and changed circumstances;
- funding; and
- information management.

##### **6.4.1. SCVHP Implementation Key Deadlines for Compliance**

The Parties' agreement about how key elements of the SCVHP will be implemented over time are summarized in the implementation compliance deadlines set forth in Table 8-2 of the SCVHP and further explained in SCVHP Chapter 8.12. The Parties recognize that, under certain circumstances, it might be reasonable and appropriate to modify one or more of the deadlines by modifying or amending the SCVHP, this Agreement, or the Permits, as provided in Agreement Section 15. However, absent such a modification or amendment, the Implementing Entity, on behalf of the Permittees, will meet the implementation deadlines set forth in SCVHP Table 8-2 .

#### **6.5. Collaboration among the Parties**

The Parties agree that successful collaboration among them is important to the success of the SCVHP. Notwithstanding any other Section of this Agreement or Chapter of the SCVHP, each Party will make a reasonable effort to: meet and confer with any other Party upon the request of that Party to address matters pertaining to the SCVHP, the Permits, or this Agreement; provide relevant, non-proprietary, non-confidential information pertaining to the SCVHP upon the request of any Party; and provide timely responses to requests from any Party for advice, concurrence, or review and comment on reports, surveys or other documents, regarding matters pertaining to the SCVHP, the Permits, or this Agreement.

## **6.6. Dispute Resolution**

The Parties recognize that disputes concerning implementation or interpretation of this Agreement, the SCVHP, and the Permits may arise from time to time. The Parties intend to resolve most disputes at the staff or field personnel level. However, the Parties recognize that some disputes might not be resolved at the staff or field personnel level. The Parties agree to work together in good faith to resolve such disputes using the informal dispute resolution procedure set forth in this Section. Any Party may seek any available remedy without regard to this Section if the Party concludes that circumstances so warrant. However, unless the Parties agree upon another dispute resolution process, or unless a Party has initiated administrative proceedings or litigation related to the subject of the dispute in federal or state court, the Parties agree to use the following procedures to attempt to resolve disputes.

### **6.6.1. Notice of Dispute; Meet and Confer**

If a Wildlife Agency objects to any action or inaction by any Permittee on the basis that the action or inaction is inconsistent with the SCVHP, the Permits, or this Agreement, it will so notify the Permittee and the Implementing Entity and when appropriate, other Wildlife Agencies, in writing, explaining the basis of such objection. The Permittee or Implementing Entity will respond to the notice within thirty (30) days of receiving it, stating what actions the Permittee or Implementing Entity proposes to take to resolve the objection or, alternatively, explaining why the objection is unfounded. If the response resolves the objection to the satisfaction of the Wildlife Agency, the agency will so notify the Permittee and the Implementing Entity, and the Permittee or Implementing Entity, as appropriate, will implement the actions, if any, proposed in the response to the agency. If the response does not resolve the objection to the Wildlife Agency's satisfaction, the agency will notify the Permittee or Implementing Entity accordingly, and the agency, the Permittee and the Implementing Entity will meet and confer to attempt to resolve the dispute. The meeting will occur within thirty (30) days after the Permittee or Implementing Entity receives the Wildlife Agency's response, or at such later time as the Permittee, the Implementing Entity and the Wildlife Agency may agree. A representative of the Implementing Entity will take notes at the meeting, summarize the outcome, and distribute meeting notes to each Party in attendance.

The Implementing Entity or any other Permittee will use the same procedure to raise and to resolve objections to any action or inaction of a Wildlife Agency, and the Wildlife Agency will respond in the same manner to notices delivered by any Permittee.

### **6.6.2. Elevation of Dispute**

If the Parties do not resolve a dispute after completing the dispute resolution procedure in Agreement Section 6.6.1, any one of the Parties may elevate the dispute to a meeting of the chief executives of the involved Parties. For purposes of this provision, "chief executive" means the city manager of a city, the county executive of the County, the chief executive officer of the Water District, the general manager of the VTA, the executive director of the Implementing Entity, the CDFG Regional Manager, and the USFWS Field Supervisor. Each Party will be represented by its chief executive in person or by telephone at the meeting, and the meeting will occur within forty-five (45) days of a request by any Party following completion of the dispute resolution procedure.

## **7. TAKE AUTHORIZATION**

As of the Effective Date, the Permittees may Take the Covered Species, provided the Take is incidental to the implementation of Covered Activities in the Permit Area, as further authorized by and subject to the conditions of this Agreement, the SCVHP, and the Permits. The Covered Activities include all activities identified as such in SCVHP Chapter 2.3. The Permits do not authorize Take resulting from projects or activities that are not identified as Covered Activities in SCVHP Chapter 2.3.

The Permittees' Take authority covers all of their respective elected officials, officers, directors, employees, agents, subsidiaries, and contractors who engage in any Covered Activity. Each Permittee will be responsible for supervising compliance with the relevant terms and conditions of the Permits by its own elected officials, officers, etc., and all contracts between a Permittee and any such person or entity regarding the implementation of a Covered Activity will require compliance with the Permits. The Implementing Entity will periodically provide an educational program to fully inform all such persons and entities of the relevant terms and conditions of the Permits. In this context, 'periodically' means at least once every five years or sooner if at least 50% of the targeted positions have new personnel.

### **7.1. Issuance of the Permits**

Concurrent with its execution of this Agreement, and after satisfaction of all other applicable legal requirements, USFWS will issue the Permittees a permit under Section 10(a)(1)(B) of the ESA (the "**Federal Permit**"). The Federal Permit will authorize incidental take of all Federal Listed Covered Species resulting from Covered Activities in the Permit Area. Subject to compliance with all other terms of this Agreement, the Federal Permit will take effect for all Non-listed Covered Species upon the listing of such species under the ESA.

Concurrent with its execution of this Agreement, and after satisfaction of all other applicable legal requirements, CDFG will issue the State Permit.

### **7.2. Ongoing Role of Wildlife Agencies**

As of the Effective Date, the Permittees may implement Covered Activities and extend Authorized Take coverage to Third Party Participants in accordance with the Permits without the prior approval of the Wildlife Agencies, except as provided in Agreement Section 7.2.1. As further described in SCVHP Chapter 8.7.3, the Wildlife Agencies' will monitor implementation of the SCVHP to ensure overall compliance with the Permits. To ensure that the Wildlife Agencies are adequately informed about the Permittees' use and extension of Authorized Take coverage, the Permittees will provide copies of any application and supporting information required in SCVHP Chapter 6.8 for any Covered Activity upon the request of any Wildlife Agency.

As further described in SCVHP Chapter 8.7.3, the Wildlife Agencies' approval is required for certain components of the conservation strategy and specific projects. The Wildlife Agencies will be third-party beneficiaries on conservation easements recorded on Reserve System lands, as further described in SCVHP Chapter 8.6.3. The Wildlife Agencies will also participate in implementation of the SCVHP adaptive management program, as further described in SCVHP Chapter 7.

### **7.3. Authorized Take for Projects and Activities Implemented by Permittees**

Each Permittee will ensure that all Covered Activities it implements comply with the Permits. As further described in SCVHP Chapter 8.7.1, as of the Effective Date, each Permittee will document such compliance and provide a copy of that documentation to the Implementing Entity, which will maintain a record of compliance documentation for all Covered Activities implemented by Permittees.

Within one (1) month after the Effective Date, the Permittees will develop a template to standardize the form in which they document their compliance with the Permits. The template will be substantively similar to the “Habitat Plan Application Package” for Private Project Participants, as described in Agreement Section 7.4 and SCVHP Chapter 6.7 and SCVHP Chapter 6.8. However, the Permittees may adapt the form of the Habitat Plan application package for their use as they deem appropriate. Until the template is developed for Covered Activities implemented by the Permittees, the Permittees will use the Habitat Plan Application Package used for Private Project Participants.

When one or more SCVHP Fees are required for a Covered Activity implemented by a Permittee, the Implementing Entity will calculate the required fee amount, and the Permittee will transfer that amount to the Implementing Entity before initiating the Covered Activity. As further described in SCVHP Chapter 9.4.1, Permittees may use any applicable alternative to fee payment allowed in the SCVHP, including, but not limited to, providing suitable land in lieu of some or all fees. Permittees with the ability to implement actions described in SCVHP Chapter 5, pertaining to the SCVHP Conservation Strategy, or SCVHP Chapter 7, pertaining to the SCVHP monitoring and adaptive management program, that contribute to the successful implementation of the SCVHP Conservation Strategy, may obtain a credit against all or a portion of a required fee amount in exchange for implementation of those actions. The Implementing Entity will prepare a written determination of whether any such credit proposed by a Permittee conforms to the SCVHP and is approved. The written determination will include the amount of any approved credit, as described in SCVHP Chapter 9.4.1.

Take Authorization coverage for any Covered Activity implemented by a Permittee will take effect upon the Permittee’s delivery to the Implementing Entity of its documentation of compliance with this Agreement, the SCVHP, and the Permits, and any required fee amount or any fee alternative approved by the Implementing Entity.

### **7.4. Extension of Take Authorization to Third Party Participants**

As further provided by the Permits, Authorized Take coverage may be extended to “**Third Party Participants**,” which include “**Private Project Participants**,” “**Participating Special Entities**” and “**Neighboring Landowners**.” The Implementing Entity may extend Authorized Take coverage to Participating Special Entities and Neighboring Landowners and will be responsible for determining whether applications or requests from potential Participating Special Entities and Neighboring Landowners comply with all applicable terms and conditions of the Permits. The County and Cities may extend Authorized Take coverage to Private Project Participants and will be responsible for determining whether applications from potential Private Project Participants comply with all such

terms and conditions and will make findings supporting such determination before extending Authorized Take coverage.

#### **7.4.1. Private Project Participants**

The County and the Cities will each require proponents of private projects that are subject to their land use or other regulatory authority and fall within the categories of projects and activities described in SCVHP Chapter 2.3 to comply with all applicable terms and conditions of the Permits, and will extend Authorized Take coverage to such projects, as provided in this Section.

##### **7.4.1.1. SCVHP Application Process**

As further described in SCVHP Chapter 6.7.2, the County and the Cities will require proponents of private projects that are subject to their land use or other regulatory authority and fall within the categories of projects and activities described in SCVHP Chapter 2.3 to submit an application package as described in SCVHP Chapter 6.8 and will review the application package based on an "Evaluation Checklist" that will be prepared by the Implementing Entity. The County's and Cities' review of the application package will occur concurrently with the environmental review of the project pursuant to CEQA, for projects subject to CEQA.

Based on its review of each application package, the applicable City or the County will prepare a written determination regarding whether the private project, as proposed in the application package, includes all applicable terms and conditions of the Permits and that take associated with the implementation of the proposed project is properly authorized through the Permits. If the City or County concludes that the project as proposed does not include all applicable terms and conditions, it will explain the deficiency or omission in writing to the private project proponent and will reject the application. If the City or County concludes that the project as proposed includes all applicable terms and conditions, it will prepare a written determination to that effect (a "Compliance Determination").

The Cities and the County will provide each Compliance Determination to the Implementing Entity and maintain a copy of all SCVHP application packages for which they have prepared a Compliance Determination, which shall be made available to the Implementing Entity as part of annual and other reviews.

Nothing in this Section shall be construed to affect the ability of the County or a City to determine that an application for a private project is incomplete or to deny a private project application for any reason unrelated to the SCVHP or the Permits.

##### **7.4.1.2. Extension of Authorized Take Coverage to Private Project Participants**

If a City or the County prepares a Compliance Determination for a private project following completion of the SCVHP application process, the private project proponent will be eligible for Authorized Take coverage as a Private Project Participant. The City or County will require the private project proponent to comply with all applicable terms and conditions of the Permits. The City or County may enter into an agreement in which the project's proponent assumes the obligation to comply with such terms and conditions or may require such compliance as a condition of project approval. Once the agreement is entered into or the conditions of approval are imposed,

all applicable SCVHP Fees have been paid to the Implementing Entity as provided in Agreement Section 8.2 and further described in SCVHP Chapter 9.4.1, and any lands in lieu of fees have been provided as provided in Agreement Section 8.2 and further described in SCVHP Chapter 8.6.7, and the City or County has otherwise finally approved the project, the applicable City or the County will extend Authorized Take coverage to the project proponent. The project proponent thereafter will have Authorized Take coverage as a Private Project Participant.

Once Authorized Take coverage has been extended to a Private Project Participant, it will remain in effect with regard to the project for as long as the Private Project Participant fully complies with all applicable terms and conditions of the Permits, unless:

- the Wildlife Agencies have suspended or revoked the Permits;
- Take has not yet occurred; and
- the Wildlife Agencies determine that Take caused by the project would result in jeopardy.

If the Private Project Participant does not comply with such terms and conditions, or if the applicable City or County suspends or revokes its approval of the project, the City or County will also suspend or revoke the Authorized Take coverage for the project.

The County and the Cities will not require Private Project Participants to provide any additional mitigation to address impacts to Covered Species beyond what is required in the Permits for purposes of extending Authorized Take; provided, however, that the County and Cities may impose additional requirements for purposes of other state or federal environmental permits, e.g., permits under the Federal Clean Water Act.

#### **7.4.1.3. SCVHP Implementing Ordinances**

Before the Effective Date, the Cities and the County will each consider the adoption of an SCVHP implementing ordinance substantively similar to the model ordinance attached to this Agreement as **Exhibit B** that sets forth the application process for potential Private Project Participants. The implementing ordinance will, among other things: provide for the imposition of SCVHP Fees, as provided in Agreement Section 8.2 and further described in SCVHP Chapter 9.4.1; establish the jurisdiction's procedure for extending Authorized Take coverage to Private Project Participants, as provided in this Agreement Section 7.4.1; and provide for the conveyance of land in lieu of SCVHP Fees, in accordance with Agreement Section 8.3 and SCVHP Chapter 8.6.7. The Cities and the County may extend Authorized Take coverage to Private Project Participants only after adopting an SCVHP implementing ordinance in accordance with this Section. In addition, the Permittees recognize that the Wildlife Agencies' findings regarding the adequacy of funding for SCVHP implementation will be based, in part, on the expectation that the Cities and the County will adopt implementing ordinances that require the payment of SCVHP Fees and that failure by a City or the County to adopt an implementing ordinance will prevent the Permits from taking effect.

The model ordinance in **Exhibit B** is intended to exemplify the necessary substantive terms of an SCVHP implementing ordinance; it is not intended to dictate the precise terms of each such ordinance. The County and each City may each adapt the model ordinance to reflect its independent findings, to maximize administrative efficiency, or for other reasons, provided the

substance of the operative terms in the model ordinance is reflected in each implementing ordinance.

#### **7.4.2. Participating Special Entities**

As further described in SCVHP Chapter 8.4, the Implementing Entity may extend Authorized Take coverage to public entities that are not Permittees, including, but not limited to, school, water, irrigation, transportation, park and other districts and utilities, pursuant to a contractual agreement that defines all planning, implementation, management, enforcement and funding responsibilities necessary for the entity to comply with the Permits. Such public entities thereafter will have Authorized Take coverage as Participating Special Entities.

The Implementing Entity may, with Wildlife Agency approval, enter into an agreement with a Participating Special Entity if the Participating Special Entity explains how it will comply with all applicable terms and conditions of the Permits in an application satisfying the criteria detailed in SCVHP Chapter 6.8. Among other things, the agreement must adequately address the legal and equitable remedies available to the Implementing Entity if the Participating Special Entity fails to perform its contractual obligations. As provided in SCVHP Chapter 8.4, after execution of such an agreement and the payment of all fees specified by the Implementing Entity, the Implementing Entity may issue a "Participating Special Entity Certificate of Inclusion" to the Participating Special Entity that describes the scope of its Authorized Take coverage and sets forth the conservation measures the Participating Special Entity is required to implement. A Participating Special Entity Certificate of Inclusion template will be developed by the Implementing Entity and approved by the Wildlife Agencies prior to the Implementing Entity extending authorized take coverage to any Participating Special Entity. The Implementing Entity will enforce the terms of the Permits with regard to any such Participating Special Entity and will withdraw the Certificate of Inclusion and terminate any Authorized Take coverage extended to the Participating Special Entity if the Participating Special Entity fails to comply with such terms.

#### **7.4.3. Neighboring Landowners**

The Implementing Entity may extend Authorized Take coverage to owners of farmlands, as further described in SCVHP Chapter 10.2.7, and as provided herein. Owners of farmlands are eligible to receive Authorized Take coverage as a Neighboring Landowner for any portion of their lands that is within one mile of the boundary of lands included in the Reserve System. For purposes of this Section, "farmlands" means lands in production at the time applicable reserve unit is created on which normal agricultural practices are conducted, including, but not limited to, crop planting and production, irrigation and fertilization, soil tilling, crop harvesting, grazing including intensive livestock grazing on irrigated pasture, forage production, animal production and husbandry, and other associated activities such as fence construction and maintenance, vehicle or horse use, and construction and maintenance of typical farm outbuildings. Authorized Take for Neighboring Landowners will cover only normal agricultural practices. Participation in the SCVHP as a Neighboring Landowner is voluntary; farmland owners are not required by the SCVHP to seek Authorized Take coverage for normal agricultural practices.

#### **7.4.3.1. Activities Covered by Neighboring Landowner Take Authorization**

Neighboring Landowner Take Authorizations will cover routine agricultural practices, as further described in SCVHP Chapter 10.2.7, including without limitation normal crop rotation practices in which land is periodically fallowed and subsequently returned to cultivation.

#### **7.4.3.2. Limitations of Neighboring Landowner Take Authorizations**

Neighboring Landowner Take Authorizations are limited to the Take of three Covered Species whose populations have the potential to expand into farmlands from Reserve System lands. These three Covered Species are California red-legged frog, California tiger salamander, and western pond turtle. Neighboring Landowner Take Authorizations therefore will not cover take of other Covered Species or Take that occurred on farmlands before Reserve System lands were established within one mile of the farmlands. Neighboring Landowner Take Authorizations will cover only normal agricultural practices that occur within one mile of the boundary of Reserve System lands.

Neighboring Landowner Take Authorizations will not cover:

- conversion of farmlands to non-agricultural uses;
- conversion of crop lands to permanent crops, such as vineyards and orchards;
- non-agricultural uses;
- non-agricultural activities on farmlands; or
- pesticide use.

The Implementing Entity will establish the term of Neighboring Landowner Take Authorizations, which in no event will exceed the term of the Permits.

#### **7.4.3.3. Neighboring Landowner Certificates of Inclusion**

The Implementing Entity may extend Neighboring Landowner Take Authorization coverage to a farmland owner by issuing the landowner a Neighboring Landowner Certificate of Inclusion (Exhibit C) that reflects the requirements of Agreement Section 7.4.3 following the documentation of baseline environmental conditions on the farmlands. Farmland owners seeking a Neighboring Landowner Take Authorization may either retain their own qualified biologist to prepare a baseline conditions report or may request the Implementing Entity to evaluate and record the baseline environmental conditions. A farmland owner that uses the Implementing Entity for this purpose will reimburse the Implementing Entity's costs. Farmland owners are responsible for paying the costs of surveys and reports required to obtain a Neighboring Landowners Take Authorization. For purposes of this provision, a "qualified biologist" is a professional biologist approved by the Implementing Entity, USFWS and CDFG, as further described in SCVHP Chapter 6.8.5. The baseline conditions report must contain, at a minimum, a description of the extent and quality of Covered Species habitat present on the farmlands, the results of Covered Species surveys on the lands, and any records of Covered Species occurrences within one mile of the lands. The Implementing Entity will review all baseline conditions reports submitted by farmland owners to ensure that they are complete and based on accepted scientific practices for species and habitat surveys, and will reject incomplete or inadequate reports. Once the baseline environmental conditions have been documented in a complete and adequate baseline conditions report, and subject to the terms and

conditions in this Agreement Section 7.4.3 and SCVHP Chapter 10.2.7, the Implementing Entity will issue the owner of the farmlands a Certificate of Inclusion providing Neighboring Landowner Take Authorization coverage for normal agricultural practices on the land.

The Implementing Entity will require the covered farmland owner to sign the Neighboring Landowner Certificate of Inclusion. Neighboring Landowner Certificates of Inclusion will not be transferable. Subsequent owners of farmlands covered by a Neighboring Landowner Certificate of Inclusion must request the Implementing Entity to issue, and must sign, a new Neighboring Landowner Certificate of Inclusion, if they choose to continue enrollment. Subsequent owners of covered farmlands will not, however, be required to prepare, or to ask the Implementing Entity to prepare, a new baseline conditions report if there is no lapse in coverage under or compliance with the Neighboring Landowner Certificate of Inclusion.

The Implementing Entity will maintain a record of all Neighboring Landowner Certificates of Inclusion, and the size and location of lands covered by them, and will include a summary of this information in its Annual Report. Copies of Neighboring Landowner Certificates of Inclusion will be provided to the Wildlife Agencies upon request.

#### **7.5. Contra Costa Goldfields**

Nothing in the Permits is intended or will be construed to allow the Take of Contra Costa goldfields (*Lasthenia conjugens*), as further described in SCVHP Chapter 6.3.

#### **7.6. The Migratory Bird Treaty Act**

The Federal Permit will constitute a Special Purpose Permit under the Migratory Bird Treaty Act as provided at 50 Code of Federal Regulations section 21.27 for the Take of least Bell's vireo (*Vireo bellii pusillus*), subject to the terms and conditions specified in the Federal Permit, as of the Effective Date. The Special Purpose Permit will be valid for a period of three (3) years from the Effective Date, provided the Federal Permit remains in effect for such period. The Special Purpose Permit will be renewed in accordance with the Migratory Bird Treaty Act provided that the Permittees remain in compliance with the Federal Permit. Each such renewal will be valid for the maximum period allowable under the applicable regulations at the time of the renewal (which, as of the Effective Date, is three (3) years), provided that the Federal Permit remains in effect for such period. If and when any other Covered Species that is a migratory bird becomes a Federal Listed Species, the Federal Permit will automatically constitute a Special Purpose Permit for that species as of the date the Federal Permit becomes effective as to such species, as provided in Agreement Section 7.1.

#### **7.7. Activities Not Covered**

Projects and activities that are not Covered Activities, as described in SCVHP Chapter 2.4, will not receive Authorized Take Coverage and are not subject to the terms and conditions of the Permits.

#### **7.8. Relationship of SCVHP to Three Creeks Habitat Conservation Plan**

The Water District is expected to apply for separate incidental take permits from USFWS and the National Marine Fisheries Service to cover activities addressed in the "Three Creeks Habitat Conservation Plan" (the "3CHCP"). If issued, the Water District's 3CHCP incidental take permits will

be independent and severable from the SCVHP Federal Permit, such that, if the 3CHCP permits are subsequently suspended or revoked, such suspension or revocation will not, by itself, affect the SCVHP Federal Permit or the Permittees' obligations under the SCVHP Federal Permit, and vice versa. The Water District's 3CHCP incidental take permits are expected to cover some activities that are also SCVHP Covered Activities, such that the Water District will have incidental take authorization for certain SCVHP Covered Activities under both the SCVHP Federal Permit and the 3CHCP incidental take permits.

The Water District will be solely responsible for administering and implementing the 3CHCP. The Water District will coordinate with the Implementing Entity and the Wildlife Agencies regarding implementation of 3CHCP as appropriate to eliminate redundancies. If, and to the extent that, the 3CHCP requires mitigation for impacts also addressed by the SCVHP, the Parties agree that the Water District will not be required to implement the duplicative measure twice (e.g., will not both have to pay a fee under the SCVHP that is intended to fund land acquisition and also directly to fund a land acquisition under the 3CHCP to mitigate the impacts of the same project or activity). The Implementing Entity will be responsible for monitoring and reporting on measures implemented by the Water District that fulfill SCVHP requirements just as it is responsible for monitoring and reporting on other SCVHP measures, regardless of whether the measures also fulfill requirements under the 3CHCP.

Notwithstanding anything in this Agreement or the SCVHP to the contrary, the Parties further agree that conservation actions anticipated to be undertaken by the Water District in implementing the 3CHCP will be eligible to offset SCVHP Fees and, if implemented and approved by the Implementing Entity, may be credited against any SCVHP Fees the Water District may otherwise be obligated to pay, in the manner and to the extent provided in SCVHP Chapter 9.4.1.

## **8. CONDITIONS ON COVERED ACTIVITIES**

The impacts to Covered Species and natural communities resulting from Covered Activities will be minimized and mitigated by the implementation of the SCVHP Conservation Strategy, by avoidance and minimization measures for Covered Activities, and related application and survey requirements, described in SCVHP Chapter 6, and by the payment of certain fees that will be used to fund implementation of the SCVHP described in SCVHP Chapter 9. The measures described in SCVHP Chapter 6 and the fee requirements described in SCVHP Chapter 9 are referred to herein and in the SCVHP as “**Conditions on Covered Activities**” or “**Conditions.**” Most of these Conditions apply to specific types of Covered Activities; no individual Covered Activity is anticipated to need to comply with all Conditions. Instead, each Covered Activity will comply with certain applicable Conditions. The Permittees will ensure that all applicable Conditions are incorporated in Covered Activities, as provided in this Section.

### **8.1. Avoidance and Minimization of Impacts**

As further described in SCVHP Chapter 6, the SCVHP includes Conditions to avoid or minimize the Take of Covered Species resulting from Covered Activities. These Conditions are designed to form a regional program that will be implemented systematically to: prevent Take of individuals of certain

Covered Species; avoid impacts to Covered Species to the maximum extent practicable; minimize adverse effects on Covered Species and natural communities to the maximum extent practicable; and avoid and minimize direct and indirect impacts on wetlands and streams. Each Permittee will incorporate all applicable Conditions within all Covered Activities that it implements. In addition, the County and the Cities will require all applicable Conditions as conditions of approval for all Private Project Participant Covered Activities, and the Implementing Entity will ensure that the Conditions are incorporated in all Participating Special Entity Covered Activities.

#### **8.1.1. Avoidance and Minimization of Impacts to Species Protected under Laws other than the ESA or CESA**

All Covered Species that are bird species (western burrowing owl, least Bell's vireo, and tricolored blackbird) are protected under the Migratory Bird Treaty Act. As provided in Agreement Section 7.7, the Federal Permit will be a Special Purpose Permit under the Migratory Bird Treaty Act for the least Bell's vireo, which is a Federal Listed Species. However, unless and until the western burrowing owl or the tricolored blackbird become Federal Listed Species and the Federal Permit becomes a Special Purpose Permit for those species, the Migratory Bird Treaty Act will prohibit killing or possessing them or their young, nests, feathers, or eggs.

The Permits authorize Take of Covered Species only. As further described in Condition 1, Covered Activities must comply with applicable state and federal laws that protect species that are not Covered Species just as they would without the Permits.

#### **8.1.2. Exemptions from Conditions to Avoid and Minimize Impacts**

Certain Covered Activities will not disturb the ground or will have little measurable impact on Covered Species or natural communities. These Covered Activities will receive the same Authorized Take coverage as other Covered Activities. However, as further described in SCVHP Chapter 6.2 and SCVHP Table 6-1, some or all conditions on Covered Activities described SCVHP Chapter 6, including the requirement in SCVHP Chapter 6.8 to submit a Habitat Plan Application, will not apply to these Covered Activities.

### **8.2. SCVHP Fees**

As provided in this Section and further described in SCVHP Chapter 9, the Implementing Entity will use revenues generated from certain fees placed on Covered Activities to fund the implementation of the conservation strategy described in SCVHP Chapter 5. Such actions include, but are not limited to creation of the SCVHP Reserve System, management of Reserve System lands, monitoring of and reporting on SCVHP implementation, adaptive management, responses to Changed Circumstances, and related planning and administrative costs. These actions, together with the avoidance and minimization measures provided for in Agreement Section 8.1, will fulfill all requirements under the ESA and the NCCPA to minimize and mitigate for the impacts of Covered Activities on Covered Species and natural communities.

The SCVHP includes several types of fees, which are referred to collectively in this Agreement as the "SCVHP Fees." The SCVHP Fees, exemptions from the fees, fee credits, and the method of calculating the fees is further described in SCVHP Chapter 9.4.1.

### **8.2.1. Exemptions from SCVHP Fees**

Certain Covered Activities will not disturb the ground or will have little measurable impact on Covered Species or natural communities. As further described in SCVHP Chapter 6.2 and SCVHP Table 6-1, the requirement to pay SCVHP fees does not apply to these Covered Activities, except to the extent that the requirement applies to them expressly in SCVHP Chapter 9.4.1. These Covered Activities will receive the same Authorized Take coverage as other Covered Activities, and Take from these Covered Activities will be tracked and reported in the same way as Authorized Take from other Covered Activities. Covered Activities that are exempt from SCVHP Fees are further described in SCVHP Chapter 9.4.1.

### **8.2.2. Payment and Collection of Fees**

The Permittees will ensure that all applicable SCVHP Fees are paid, and all applicable fee credits are applied, for all Covered Activities, as further described in SCVHP Chapter 9.4.1. The County and the Cities will make payment of all applicable SCVHP Fees a condition of final approval for Private Project Participant Covered Activities; the Implementing Entity will require payment of all applicable SCVHP Fees for Participating Special Entity Covered Activities; and the Permittees will pay all applicable SCVHP Fees for Covered Activities that they implement. The Implementing Entity may require Participating Special Entities to pay an amount in addition to applicable SCVHP Fees to reimburse the Implementing Entity for costs associated with extending take coverage to Participating Species Entities and to help fund SCVHP conservation actions intended to contribute to the recovery of Covered Species.

The Cities and the County will collect fee payments from Private Project Participants and provide the fee revenues to the Implementing Entity at least annually. The Implementing Entity will collect all fee revenues, including fee payments from the Permittees for Covered Activities that they implement. The Implementing Entity will comply with all applicable provisions of the Mitigation Fee Act (Gov. Code §66000, et seq.) as to the deposit, accounting, expenditure and reporting of such fee revenues.

### **8.3. SCVHP Fee Credits**

As further described in SCVHP Chapter 8.6.7 and SCVHP Chapter 9.4.1, the Implementing Entity may approve SCVHP Fee credits for the conveyance of lands that are added to the Reserve System and for the implementation of SCVHP conservation actions. The SCVHP Fee credits may be used for some of the SCVHP Fees that apply to one or more Covered Activities, except that SCVHP Fee credits may not be used for the Wetland Fee. SCVHP Fee credits do not have any value except as credits for SCVHP Fees incurred during the Permit Term. SCVHP Fee credits remaining after the Permit Term will have no value, and no payment or “refund” will be made. Selling or trading of SCVHP Fee credits will not be allowed.

The Implementing Entity will prepare a written determination stating whether any proposed SCVHP Fee credit meets the requirements of the SCVHP and this Agreement, and whether, or to what extent, the credit is approved by the Implementing Entity. The written determination will include the amount of any approved credit. The amount of an approved SCVHP Fee credit may be

deducted from the SCVHP Fees that apply to any Covered Activity implemented by the Permittee, Private Project Proponent, or Participating Special Entity that received the approved credit.

The Implementing Entity may disapprove a proposed SCVHP Fee credit if it determines that approval of the credit would constrain the Implementing Entity's ability to meet Reserve System requirements or otherwise impede the successful implementation of the SCVHP, such as, for example, and without limitation, by creating a shortfall in fee revenues for Reserve System management or monitoring or by impairing the Implementing Entity's ability to meet the requirements of Agreement Section 9.4 or SCVHP Chapter 8.6.1.

#### **8.4. Timing of Fee Payment**

All applicable SCVHP Fees, subject to any SCVHP Fee credits, will be collected before the Covered Activity for which the fees are required is implemented. The County and the Cities will require Private Project Participants to pay all applicable fees before or concurrent with the issuance of a grading permit for each Private Project Proponents' Covered Activity. If a grading permit is not required for the Covered Activity, payment of the fees will be required before the first building or construction permit is issued. The Implementing Entity will require Participating Special Entities to pay all applicable fees before initiating ground-breaking activities for their Covered Activities, and the Permittees will pay all applicable fees before implementing any Covered Activity.

#### **8.5. Adjustment of Fees**

As further described in SCVHP Chapter 9.4.1, there are three ways in which the Implementing Entity will evaluate the amount of SCVHP Fees and adjust them as necessary to account for increases or decreases in the cost of implementing the SCVHP: by annual adjustments, by biennial reviews, and by periodic assessments. The Implementing Entity will adjust the rate of the SCVHP Fees annually, by the date established by the Implementing Entity for this adjustment, according to the indices and procedures described in Table 9-12 of the SCVHP, beginning the calendar year following the Effective Date. The date of the automatic update will be determined by the Implementing Entity's Governing Board within the first six months of Plan implementation. At least once every two (2) years, the Implementing Entity will review fee revenues and compare them to the actual and projected portion of SCVHP implementation costs that must be funded by fee revenues to determine whether the annual adjustments to SCVHP fees are sufficient to keep pace with actual costs and to provide the Implementing Entity an additional opportunity to adjust fees, if needed.

In addition, the Implementing Entity will conduct a periodic assessment concurrent with an annual adjustment of the SCVHP Fees to evaluate whether fee revenues are adequate to cover the appropriate portion of implementation costs, as described in SCVHP Chapter 9. The Implementing Entity will conduct the periodic assessment at least once every five (5) years, where year one (1) is the first full calendar year after the Effective Date.

SCVHP fees may be increased or decreased based on the results of the annual adjustments, biennial review, or periodic assessment. However, SCVHP fees must always be based on the mitigation requirement methodology described in SCVHP Chapter 9.4.1. The Permittees will not be required to

increase SCVHP Fees to address shortfalls in other sources of funding or to decrease the Fees in response to windfalls in other sources of funding.

## **9. CREATION OF RESERVE SYSTEM**

The creation and management of the Santa Clara Valley Habitat Plan Reserve System (the “**Reserve System**”) is an essential element of the SCVHP Conservation Strategy. The Implementing Entity will create the Reserve System on behalf of the Permittees as provided in this Section and further described in SCVHP Chapter 5 and SCVHP Chapter 8. With the exception of existing Santa Clara Valley Open Space Authority lands, described in Agreement Section 9.2, the Reserve System will be created by permanently protecting land containing certain terrestrial and aquatic land cover types and managing and monitoring them in perpetuity. Lands consistent with the conservation strategy that are owned by a Permittee may be added to the Reserve System upon approval by the Implementing Entity and Wildlife Agencies and protection through a conservation easement, as provided in this Section and as further described in SCVHP Chapter 5.2.3 and SCVHP Chapter 8.6.

Reserve System lands will be actively managed for the benefit of Covered Species, and habitat on Reserve System lands will be enhanced or restored where appropriate, to improve habitat for Covered Species and natural communities, as provided in Agreement Section 10 and further described in SCVHP Chapters 5.2.5, 5.3 and 5.4.

The Implementing Entity will create and complete the Reserve System according to prescribed deadlines as provided in Agreement Section 6.4.1 and further described in SCVHP Chapter 5.3.1, Table 5-14, and Chapter 8.12. In addition, lands must be added to the Reserve System at a pace that is roughly proportional to the rate at which Covered Activities are implemented and Authorized Take occurs, as provided in Agreement Section 9.4 and further described in SCVHP Chapter 8.6.1, even if this would require the Reserve System to be created and completed more quickly than needed to meet the deadlines.

### **9.1. Criteria for Reserve System Lands**

As further described in SCVHP Chapter 8.6, the Implementing Entity must obtain USFWS' and CDFG's advance approval for all lands added to the Reserve System, including lands owned by a Permittee, fee title transfers and conservation easement acquisitions; provided, however, that if either Wildlife Agency does not respond to a written request for approval of a proposed addition of lands from the Implementing Entity within thirty (30) days after receiving such a request, the Wildlife Agency will be deemed to have approved the acquisition for purposes of this Agreement, the SCVHP and the Permits.

Only lands that meet all of the following criteria may be counted toward the Reserve System requirements of the SCVHP.

- The lands must contribute to the SCVHP Conservation Strategy.
- The land has no hazardous materials or property encumbrances that conflict with the SCVHP Conservation Strategy.

- The lands must be consistent with SCVHP reserve design and assembly principles, as described in SCVHP Chapter 5.
- The lands must meet all relevant criteria in SCVHP Chapter 5.3.1 for landscape linkages, land cover types, plant populations, modeled species habitat, and species occupancy.
- The biological functions and values on the lands that contribute to the SCVHP Conservation Strategy must be permanently protected, with the exception of existing Santa Clara Valley Open Space Authority Land, described further in Agreement Section 9.2.
- A Reserve Unit Management Plan must be prepared for the lands, as provided in Agreement Section 10 and further described in SCVHP Chapter 5.2.5 and SCVHP Chapter 5.3.
- The lands were not used to fulfill mitigation requirements for a project or activity that is not a Covered Activity.

## **9.2. Permanent Protection of Reserve System Lands**

As provided in Agreement Section 9, Reserve System lands will be permanently protected. For purposes of the Permits, Reserve System lands will be regarded as permanently protected if the biological functions and values on the lands that contribute to the SCVHP Conservation Strategy are protected by a permanent, recorded conservation easement that meets the requirements of this Section and SCVHP Chapter 8.6.3. However, up to one-thousand (1,000) acres of land owned by the Santa Clara Valley Open Space Authority as of the Effective Date, on which the recordation of a conservation easement is precluded by law, may be added to the Reserve System without recordation of a conservation easement, provided the lands otherwise meet the requirements for Reserve System lands, as further described in SCVHP Chapter 5.2.3 and SCVHP Chapter 9.4.2.

### **9.2.1. Conservation Easements**

As further described in SCVHP Chapter 8.6.3, the Implementing Entity will negotiate the specific terms and conditions of conservation easements used to permanently protect Reserve System lands with each landowner on a case-by-case basis, based on site conditions, land uses, and Covered Species and habitat needs. However, all Reserve System conservation easements will comply with California Civil Code section 815 et seq., Government Code section 65965 et seq., and other applicable laws; will achieve certain objectives and prohibit certain uses, as further described in SCVHP Chapter 8.6.3; and will identify the Wildlife Agencies as third party beneficiaries for purposes of enforcing the terms of the easement. Reserve System conservation easements will be held by the Implementing Entity in most cases. If the Implementing Entity owns fee title to the land covered by the conservation easement, the conservation easement will be held by another conservation organization approved by the Wildlife Agencies. In addition, the Implementing Entity may, on a case-by-case basis, allow other conservation organizations approved by the Wildlife Agencies to hold Reserve System conservation easements, provided such conservation organizations enter into a binding agreement with the Implementing Entity in which they assume the obligation to enforce the terms of the conservation easement in accordance with the SCVHP, this Agreement, and the Permits and comply with all applicable legal requirements including, but not limited to, Government Code section 65965 et seq.

For purposes of lands added to the Reserve System, the Implementing Entity will use a conservation easement template agreed to by the Parties (Appendix H of the SCVHP). Reasonable variations from the template may be needed to address site-specific constraints. CDFG and USFWS, along with the Implementing Entity, must review and approve any modifications to the template easement prior to its execution.

### **9.3. Requirement for a Reserve Unit Management Plan**

As provided in Agreement Section 9 and Agreement Section 10, all Reserve System lands will be managed in perpetuity according to the applicable Reserve Unit Management Plan. Lands may be counted toward the Reserve System requirements of the SCVHP before a Reserve Unit Management Plan is prepared only if the lands are permanently protected and the fee owner of the lands is subject to an enforceable legal obligation to manage the lands, or to allow the lands to be managed, according to a Reserve Unit Management Plan.

### **9.4. Stay-Ahead or Rough Proportionality Requirement**

The Implementing Entity will ensure that lands are added to the Reserve System, and that required habitat restoration and creation occurs, at or faster than the pace at which Covered Activities impact habitat, which will fulfill the NCCPA's requirement to ensure that implementation of mitigation and conservation measures on a plan basis is roughly proportional in time and extent to the impact on habitat or covered species. (Cal. Fish & G. Code section 2820(b)(3)(D)(9).) This requirement is also referred to in the SCVHP as the "stay-ahead" requirement and will assist the USFWS in making a finding that the SCVHP will meet the requirement of Section 10(a)(2)(B)(ii) of the ESA. In order to make findings that the proposed impacts are mitigated to the maximum extent practicable, USFWS will consider temporal losses resulting from the time of impact relative to the time of mitigation. As further described in SCVHP Chapter 8.6.1, SCVHP Table 5-12 and SCVHP Table 5-14, the amount of each land cover type restored, created, and added to the Reserve System as a proportion of the total requirement for each land cover type will be equal to or greater than the impact on that land cover type as a proportion of the total impact expected by all Covered Activities. For example, at or before the time twenty-five percent (25%) of the expected impacts on mixed serpentine chaparral have occurred, the Implementing Entity will add twenty-five percent (25%) of the required acreage of mixed serpentine chaparral to the Reserve System. The Implementing Entity will in good faith attempt to maintain strict proportionality between creation of the Reserve System and the impacts of Covered Activities, but the Implementing Entity will fulfill the requirements of this Section and SCVHP Chapter 8.6.1 so long as it ensures that the pace at which the Reserve System is created, and at which required habitat restoration and creation occurs on Reserve System lands, does not fall behind the pace at which Covered Activities impact habitat by more than ten percent (10%) for each land cover type. As further described in SCVHP Chapter 8.6.1, SCVHP Chapter 5.4 and SCVHP Table 5-16, the Stay-Ahead provision also includes a requirement for acquisition of covered plant occurrences to stay ahead of impacts, with the exception of the Coyote ceanothus as described in SCVHP Chapter 5.4.11. SCVHP Chapter 8.6.1 also describes a Stay-Ahead provision specific to the Burrowing Owl Conservation Strategy. The Implementing Entity will measure and report on rough proportionality as described in Chapter 8.6.1.

#### **9.4.1. Reserve System Lands Acquired Using State or Federal Funding**

As provided in Agreement Section 13 and further described in SCVHP Chapter 9, the SCVHP funding strategy for completion of the Reserve System identifies and assumes contributions of state and federal funding. Lands added to the Reserve System using funds from state or federal agencies will be counted toward the Reserve System requirements of the SCVHP and the stay-ahead/rough proportionality requirement, but will not be credited toward SCVHP mitigation requirements.

#### **9.4.2. Failure to Stay Ahead or to Maintain Rough Proportionality**

If the Wildlife Agencies determine that the requirements of this Section or SCVHP Chapter 8.6.1 have not been fulfilled, they will so notify the Implementing Entity in writing, and the Implementing Entity and Wildlife Agencies will meet to develop a mutually agreeable plan of action that will fulfill such requirements, as further described in SCVHP Chapter 8.6.1. If the Wildlife Agencies determine specifically that the requirements of this Section and SCVHP Chapter 8.6.1 regarding the addition of land to the Reserve System have not been fulfilled, they may, by written notice to the Implementing Entity, require it to initiate the requirement to dedicate land in-lieu of SCVHP Fees set forth in Agreement Section 9.4.1. The Parties acknowledge that failure to fulfill the requirements of SCVHP Chapter 8.6.1 would constitute a violation of the Federal and State Permits and that the Wildlife Agencies will take appropriate responsive actions to address any such violation in accordance with the ESA and the NCCPA, which could include suspension or revocation of the Permits, in whole or in part.

##### **9.4.2.1. NCCPA Procedure for Addressing Failure to Maintain Rough Proportionality**

In addition to the response described in Agreement Section 9.4.2, SCVHP Chapter 8.6.1 and SCVHP Chapter 9.4.4, the NCCPA requires a specific procedure for responding to a failure to maintain rough proportionality. This Section fulfills that requirement. If CDFG determines that the requirements of this Section or SCVHP Chapter 8.6.1 have not been fulfilled, with or without the concurrence of USFWS, the Implementing Entity will either regain rough proportionality within forty-five (45) days or will enter into an agreement with CDFG within forty-five (45) days, which will set a course of action to expeditiously regain rough proportionality. The agreement may include any of a variety of commitments or adjustments to the SCVHP designed to regain rough proportionality, including but not limited to, a plan to acquire, restore, or enhance lands of the appropriate land cover or plant population type expeditiously. However, if USFWS concurs with CDFG's determination, and the Implementing Entity and the Wildlife Agencies meet to develop a plan of action, as described above, the agreement will be based on that plan of action. The Implementing Entity will provide written notice of the agreement to the other Permittees. Each Permittee will implement all actions set forth in the agreement that apply to the Permittee.

If the Implementing Entity does not regain rough proportionality within forty-five (45) days and does not enter into an agreement with CDFG within forty-five (45) days setting a course of action to regain rough proportionality, CDFG will suspend or revoke the State Permit, in whole or in part, pursuant to California Fish and Game Code section 2820, subdivision (c). The Parties agree that partial suspension or revocation may include removal of one or more Covered Species for purposes

of the State Permit or reducing the geographic scope of Authorized Take under the State Permit. Before suspending or revoking the State Permit *in whole* due to a failure to maintain rough proportionality, CDFG will meet with the Permittees to determine whether mutually agreeable modifications to the SCVHP would obviate a suspension or revocation *in whole*. The Parties agree that if CDFG suspends or revokes the State Permit, the Permittees may, based on the SCVHP, apply for one or more CESA incidental take permits under section 2081, subdivision (b), of the California Fish and Game Code to replace the State Permit.

If the NCCPA procedure for addressing a failure to maintain rough proportionality in California Fish and Game Code section 2820 is amended, the new procedure shall supersede the procedure in this Section 9.4.2.1 to the extent they are inconsistent.

The Implementing Entity will follow the same procedure with USFWS as described in this section 9.4.2.1 for responding to a failure to maintain rough proportionality for purposes of the ESA.

#### **9.4.3. Conveyance of Land in Lieu of SCVHP Fees to Maintain Rough Proportionality**

If the Implementing Entity determines at any time that the pace at which lands are added to the Reserve System is likely to fail to meet the requirements of this Agreement Section 9.4, the Implementing Entity may, after consultation with the other Permittees, require that some or all Permittees provide, and require Third Party Participants to provide, land in lieu of fees, as provided in Agreement Section 8.3 and further described in SCVHP Chapters 8.6.1 and 8.6.7. The Implementing Entity will provide written notice thereof to the other Permittees. The Implementing Entity's notice will recommend a scope of the land in lieu of fee requirement, for example, applying the land in lieu of fee requirement to Covered Activities that will impact ten (10) acres or more. All Permittees will thereafter apply the recommended land in lieu of fee requirement to Covered Activities that they implement; the Implementing Entity will apply the requirement to Participating Special Entities; and the County and Cities will consider applying the requirement to Private Project Participants. However, SCVHP Fee credits derived from the implementation of conservation actions specifically approved for SCVHP Fee credit in SCVHP Chapter 9.4.1 may be used regardless of a land in lieu of fee requirement from the Implementing Entity. The County and Cities acknowledge that failure to apply the land in lieu of fee requirement to Private Project Participants when needed to meet the requirements of this Agreement Section 9.4 may result in suspension or revocation of the Permits.

The Implementing Entity may terminate the land in lieu of fee requirement only after it determines that the pace at which lands added to the Reserve System without the requirement will likely meet the requirements of this Agreement Section 9.4. Upon making such a determination, the Implementing Entity will so notify the other Permittees in writing, and the Permittees may thereafter terminate the requirement with regard to their own Covered Activities and to Third Party Participants. However, if the Implementing Entity initiated the requirement because it was required to do so by the Wildlife Agencies as provided in Agreement Section 9.4.2, it may terminate the land in lieu of fee requirement only with the approval of the Wildlife Agencies, which approval will not be withheld unreasonably.

### **9.5. Additional Criteria for Lands Conveyed in Lieu of SCVHP Fees**

As provided in Agreement Section 8.3 and Agreement Section 9.4.1, under certain circumstances lands may be conveyed to the Reserve System in lieu of payment of some SCVHP Fees that apply to one or more Covered Activities. As further described in SCVHP Chapter 8.6.7, such lands may be added to the Reserve System and counted toward the Reserve System requirements of the SCVHP, if the lands:

- meet the criteria for Reserve System Lands in Agreement Section 9.1;
- are approved for inclusion in the Reserve System by the Implementing Entity and the Wildlife Agencies in accordance with Agreement Section 9.1; and
- are within an area designated as high or moderate priority for acquisition, as further described in SCVHP Chapter 5 and SCVHP Figure 5-8, or have unique or exceptional habitat values that meet the criteria for such high or moderate priority areas.

### **9.6. Lands Conveyed by Entities other than Permittees**

Lands acquired or owned by any Permittee that meet the requirements of Agreement Section 9.1 may be added to the Reserve System and counted toward the Reserve System requirements of the SCVHP, as further described in SCVHP Chapter 8.6.2.

#### **9.6.1. Lands in Private Mitigation Banks**

Lands in private mitigation banks within the Permit Area can be counted toward the Reserve System requirements of the SCVHP as described in SCVHP Chapter 8.6.2. With the Implementing Entity's prior approval, a Permittee or Third Party Participant may purchase credits at a private mitigation bank to fulfill the requirements of the SCVHP only if the bank occurs within the Permit Area and meets all relevant requirements pertaining to the Reserve System, habitat enhancement, adaptive management, and monitoring described in SCVHP Chapter 5 and SCVHP Chapter 7.

### **9.7. Gifts of Land**

The Implementing Entity may accept lands in fee title, or conservation easements on lands, as a gift or charitable donation. Such lands may be added to the Reserve System only if they meet the criteria in Agreement Section 9.1 and the nature of the real property interest is consistent with the requirements of Agreement Section 9.2. The Implementing Entity may sell or exchange lands it receives as a gift or donation that do not meet the criteria in Agreement Section 9.1 or the requirements of Agreement Section 9.2.

## **10. MANAGEMENT OF RESERVE SYSTEM LANDS**

The Implementing Entity, on behalf of the Permittees, will ensure that Reserve System lands are managed as provided in this Section and further described in SCVHP Chapters 5.2.5, 5.3, and 5.4. The Implementing Entity may delegate management responsibility to other Parties or qualified third parties, including but not limited to public agencies, private conservation organizations, university scientists, and contractors. However, the Implementing Entity or any successor will be responsible for ensuring the management of Reserve System lands in perpetuity.

## **10.1. Reserve Unit Management Plans**

The Implementing Entity will ensure that all Reserve System lands are managed according to appropriate Reserve Unit Management Plans. As further described in SCVHP Chapter 5.2.5, Reserve Unit Management Plans will be prepared for each reserve unit within the Reserve System to identify, on the basis of site-specific conditions, the management and maintenance actions necessary to ensure that SCHVP objectives regarding ecosystem characteristics and functions are maintained and enhanced, and to achieve other objectives, as further described in SCVHP Chapter 5.2.5.

### **10.1.1. Role of the Wildlife Agencies in Preparation of Reserve Unit Management Plans**

All Reserve Unit Management Plans must be approved by the Wildlife Agencies. The Wildlife Agencies will review each draft Reserve Unit Management Plan and provide comments to the Implementing Entity within sixty (60) days after receiving the draft plan. The Implementing Entity will revise the draft plan based on the Wildlife Agencies' comments, if any, and will provide a revised draft to the Wildlife Agencies, which will have an additional sixty (60) day review period. If an initial draft Reserve Unit Management Plan or any subsequent revised draft Reserve Unit Management Plan adequately addresses a Wildlife Agency's comments, the Wildlife Agency will so notify the Implementing Entity within sixty (60) days, and the Reserve Unit Management Plan will thereafter be deemed to be approved by that Wildlife Agency for purposes of the Permits. In addition, if a Wildlife Agency does not provide comments within sixty (60) days after receiving the revised draft Reserve Unit Management Plan, the Wildlife Agency will thereafter be deemed to have approved the revised draft plan for purposes of this Agreement, the SCVHP and the Permits. The Implementing Entity will incorporate comments submitted by the Wildlife Agency in the revised draft Reserve Unit Management Plan to the extent that the Implementing Entity determines the comments can be incorporated. In the event that the Implementing Entity determines that some or all of the Wildlife Agency comments cannot be incorporated, it will notify the Wildlife Agencies of its determination and the basis for such. The Implementing Agency will then work with the Wildlife Agencies to determine if other measures can be developed that adequately address the Wildlife Agencies' concerns.

The same Wildlife Agency review procedure will apply to all major revisions to Reserve Unit Management Plans.

### **10.1.2. Preparation and Revision of Reserve Unit Management Plans**

As further described in SCVHP Chapter 5.2.5 and SCVHP Chapter 5.3, the Implementing Entity will prepare a Reserve Unit Management Plan for each reserve unit within the Reserve System as soon as reasonably possible. The Implementing Entity will prepare a draft Reserve Unit Management Plan for Wildlife Agency review not later than five (5) years after the first parcel has been acquired within the reserve unit. Until the Reserve Unit Management Plan has been approved by the Wildlife Agencies, the Implementing Entity will manage the reserve unit based on the best available information and management methods derived from other Reserve Unit Management Plans or from other land management in the Permit Area.

Following the initial approval of a Reserve Unit Management Plan, the Implementing Entity will periodically update each Reserve Unit Management Plan as new lands are added to the reserve unit to include new management and monitoring methods, if any, needed for the new lands. The Implementing Entity will also review and, if necessary, revise all Reserve Unit Management Plans every five (5) years based on information provided through the SCVHP monitoring and adaptive management program described in SCVHP Chapter 7 and relevant outside research.

#### **10.2. Reserve Unit Management Plan Components**

The Implementing Entity will ensure that each Reserve Unit Management Plan includes the components identified in SCVHP Chapter 5.2.5 and SCVHP Chapter 5.3.2.

#### **10.3. Recreational Uses**

Recreational and educational uses will be allowed on Reserve System lands where the Implementing Entity determines that such uses would be compatible with the preservation and enhancement of Covered Species and natural communities. The Implementing Entity will ensure that a recreational uses strategy is included in all Reserve Unit Management Plans for reserve units on which educational or recreational uses will be allowed, as further described in SCVHP Chapter 6.4.6. The Implementing Entity will not allow recreational uses within any reserve unit of the Reserve System until the Wildlife Agencies have approved a Reserve Unit Management Plan that includes a recreational uses strategy for the unit in accordance with Agreement Section 10.1.1; provided, however, that existing recreational uses on lands incorporated into the Reserve System from existing open space (e.g., County Parks) will continue until the Reserve Unit Management Plan and associated recreational use strategy is completed.

#### **10.4. Monitoring Program**

All Reserve System lands will be monitored as further described in SCVHP Chapter 7. As further described in SCVHP Chapter 5.2.5 and SCVHP Chapter 7, the Implementing Entity will prepare and implement a comprehensive monitoring program for the Reserve System within five (5) years after the Effective Date.

#### **10.5. Technical Advisory Committee**

As further described in SCVHP Chapter 8.2.4, the Implementing Entity will create a technical advisory committee composed of but not limited to representatives of each land management agency that manages lands that are part of the Reserve System, including each Permittee that manages such lands, and the Wildlife Agencies, with the USFWS participating in an *ex officio* capacity. The purpose of the technical advisory committee will be to share information regarding land management generally and to coordinate the management of Reserve System lands.

### **11. MONITORING, ADAPTIVE MANAGEMENT AND CHANGED CIRCUMSTANCES**

The Implementing Entity, on behalf of the Permittees, will implement the SCVHP monitoring and adaptive management program as provided in this Section and further described in SCVHP Chapter 7. The Implementing Entity may delegate monitoring responsibilities to other Parties or qualified

third parties, including but not limited to public agencies, private conservation organizations, university scientists, and contractors.

The overarching purpose of the SCVHP monitoring and adaptive management program is to inform and refine SCVHP implementation so that it may achieve the goals and objectives of the SCVHP Conservation Strategy. The Implementing Entity will administer the adaptive management process by using information gathered from the monitoring program to inform and refine the design and management of the Reserve System. The Implementing Entity will also incorporate the recommendations of science advisors and other experts in the design and management of the Reserve System, as appropriate, and will consider the cost of implementing the monitoring and adaptive management program in its budget analysis and funding decisions.

The scope of the SCVHP monitoring and adaptive management program is limited by the regulatory assurances provided by the Wildlife Agencies, as provided in Agreement Section 12.

### **11.1. Monitoring**

The Implementing Entity will conduct three main types of monitoring, as further described in SCVHP Chapter 7.2.1: compliance monitoring, effectiveness monitoring, and targeted studies. The Implementing Entity will provide the results of all SCVHP monitoring annually in its Annual Report. Compliance monitoring, also known as implementation monitoring, will track the status of SCVHP implementation and verify that the Implementing Entity is meeting the terms and conditions of the Permits. Effectiveness monitoring assesses the biological success of the Plan—specifically, it evaluates the implementation and success of the conservation strategy described in SCVHP Chapter 5. Targeted studies will identify the best methodologies for monitoring, provide information about the efficacy of Reserve System management techniques, and resolve critical uncertainties in order to improve Reserve System management.

### **11.2. Adaptive Management**

The Implementing Entity will implement the SCVHP adaptive management program, as further described in SCVHP Chapters 7.1.2, 8.3.8, and 9.3.5. The purpose of adaptive management will be to adapt the design and management of the Reserve System in order to maximize the likelihood of the successful implementation of the SCVHP Conservation Strategy. The Implementing Entity will have ultimate responsibility for implementing the adaptive management program and will ultimately decide what adaptations will be made in the management of Reserve System lands. However, the Implementing Entity will consider the advice of the Wildlife Agencies, science advisors, the Independent Conservation Assessment Team, other land management agencies, and the public, as provided in this Section and as further described in SCVHP Chapter 7.2.3. In addition, any major changes in the adaptive management program will require the approval of the Wildlife Agencies prior to implementation, including, but not limited to, any proposed actions that would be inconsistent with the SCVHP or detrimental to a Covered Species, introducing new and untested management techniques, discontinuing and replacing ineffective management techniques that are recommended in the Conservation Strategy, or applying management techniques on a much larger or smaller scale than envisioned in the SCVHP.

#### **11.2.1. Role of the Wildlife Agencies**

The Wildlife Agencies will provide biological expertise and policy-level recommendations to the Implementing Entity regarding potential changes to the design and management of the Reserve System based on the results of monitoring and the advice of science advisors and the Independent Conservation Assessment Team, as further described in SCVHP Chapter 7.2.3. The Implementing Entity will confer with the Wildlife Agencies before initiating substantial adaptations to the design or management of the Reserve System. The Implementing Entity and Wildlife Agencies will attempt in good faith to reach agreement regarding any such adaptations or alternative adaptations that the Wildlife Agencies may propose. If they cannot reach agreement, any of them may initiate the dispute resolution procedure provided in Agreement Section 6.6.

#### **11.2.2. Role of Science Advisors**

The Implementing Entity will consult with science advisors regarding SCVHP implementation when needed to obtain expert scientific advice and recommendation regarding key scientific aspects of SCVHP implementation, such as the design, management and monitoring of the Reserve System, as further described in SCVHP Chapter 7.2.3. Science advisors will be selected by the Implementing Entity, with input from the Wildlife Agencies. For purposes of this Agreement, “science advisors” means scientists or resource managers with expertise in one or more of the following areas:

- The biology of Covered Species;
- Landscape ecology;
- Natural communities in the Reserve System;
- Ecological processes;
- Resource management;
- Biological monitoring; or
- Statistical analysis and experimental design.

#### **11.2.3. Role of the Independent Conservation Assessment Team**

The Implementing Entity will select and convene an “**Independent Conservation Assessment Team**” at least once every five (5) years to evaluate SCVHP implementation and recommend ways to improve progress toward achieving the SCVHP Conservation Strategy’s goals and objectives, as further described in SCVHP Chapter 7.2.3. The Independent Conservation Assessment Team will be composed of independent scientists and resources managers who are recognized experts in their fields. The Implementing Entity will consult with the Wildlife Agencies regarding the selection of members of the Independent Conservation Assessment Team. The Implementing Entity, in consultation with the Wildlife Agencies, will determine the scope and focus of the Independent Conservation Assessment Team’s review based on the most relevant issues and circumstances at the time of each review. However, each review will in any case include a program-level evaluation of recommendations for the following:

- The design of the Reserve System and the success of habitat restoration efforts;
- The appropriateness of monitoring and methods for purposes of achieving the SCVHP Conservation Strategy goals and objectives;

- The appropriateness of the interpretation of monitoring results as reflected in the five (5) most recent Annual Reports; and
- Adaptations that may be needed in the management of Reserve System lands.

#### **11.2.4. Advice from Other Land Management Agencies**

The Implementing Entity will from time to time consult with land management agencies in the Permit Area to share information regarding land management generally and to coordinate management of lands adjacent to Reserve System lands with the management of Reserve System lands. Organizations consulted for advice could include, but will not be limited to, private non-profit conservation organizations that are active in or near the Permit Area.

#### **11.2.5. Advice from the Public**

The Implementing Entity will provide members of the public with opportunities to learn about the status of SCVHP implementation and to provide advice regarding the adaptive management program, as further described in SCVHP Chapter 7 and SCVHP Chapter 8.2.7.

#### **11.2.6. No Increase in Take**

Section 11.2 of this Agreement does not authorize any adaptations to the design or management of the Reserve System that would result in an increase in the amount and nature of Authorized Take, or increase the impacts of Authorized Take, of Covered Species beyond that analyzed in the SCVHP and any Amendments thereto. Any such modification must be reviewed as a Permit Amendment under Agreement Section 15.

### **11.3. Changed Circumstances**

The Implementing Entity will implement responses to Changed Circumstances as provided in this Section and further described in SCVHP Chapter 10.2.1. Changed Circumstances identified and planned for in the SCVHP are contained in SCVHP Chapter 10.2.1. In the event a Changed Circumstance identified in SCVHP Chapter 10.2.1 occurs, the Implementing Entity will implement the remedial measures or actions prescribed in SCVHP Chapter 10.2.1 for that Changed Circumstance. Neither the Implementing Entity nor any other Permittee or Third Party Participant will be required to take any additional action to respond to a Changed Circumstance (i.e., any action not otherwise required by the Permits), except as described in SCVHP Chapter 10.2.1.

Changed Circumstances are provided for in the SCVHP and therefore are not Unforeseen Circumstances. The Permittees' responses to Changed Circumstances, as well as the funding to assure that the responses are implemented, are described in the SCVHP. Therefore, Changed Circumstances do not require an Amendment of the SCVHP or the Permits. The Parties agree that SCVHP Chapter 10.2.1 identifies all Changed Circumstances and describes appropriate and adequate responses for them. Other changes not identified as Changed Circumstances will be treated as Unforeseen Circumstances, as provided in Agreement Section 12.

#### **11.3.1. Initiating Responses to Changed Circumstances**

The Implementing Entity will notify the Wildlife Agencies within seven (7) days after learning that any of the Changed Circumstances listed in SCVHP Chapter 10.2.1 has occurred. The Implementing

Entity will respond to Changed Circumstances as described in SCVHP Chapter 10.2.1.

If a Wildlife Agency determines that a Changed Circumstance has occurred and that the Implementing Entity has not responded as described in SCVHP Chapter 10.2.1, the Wildlife Agency will so notify the Implementing Entity, specifically identifying the Changed Circumstance. After receiving the Wildlife Agency's notice, the Implementing Entity will initiate responsive actions in the manner described in SCVHP Chapter 10.2.1.

After it has initiated remedial measures to a Changed Circumstance as described in SCVHP Chapter 10.2.1, the Implementing Entity will promptly inform the Wildlife Agencies of its actions. The Implementing Entity will continue implementation of any such remedial measures to completion and will describe in its Annual Report for that year the Changed Circumstance and the remedial measures implemented. Subsequent Annual Reports will track the response of the Reserve System and the Covered Species to evaluate whether remedial measures implemented as a result of Changed Circumstances have been effective.

## **12. REGULATORY ASSURANCES**

The Wildlife Agencies acknowledge that the Permittees have agreed to take on the substantial responsibility of developing and implementing the SCVHP in large part to obtain regulatory assurances, as provided in the ESA and the NCCPA and further described in this Section and SCVHP Chapter 10.2.

### **12.1. ESA Regulatory Assurances**

Provided that the Permittees have complied with their obligations under this Agreement, the SCVHP and the Federal Permit, USFWS can require a Permittee or Third Party Participant to provide additional mitigation beyond that provided for in the SCVHP only with its consent and only under Unforeseen Circumstances, in accordance with the "No Surprises" regulations at 50 Code of Federal Regulations section 17.22(b)(5) and section 17.32(b)(5).

### **12.2. NCCPA Regulatory Assurances**

As long as the Permittees are properly implementing this Agreement, the SCVHP, and the State Permit, CDFG will not seek to impose on the Permittees or Third Party Participants, for purposes of compliance with the NCCPA or CESA, any avoidance, minimization, mitigation, or conservation measures or requirements regarding the impacts of Covered Activities on Covered Species within the Permit Area beyond those required by this Agreement, the SCVHP, and the State Permit. If there are Unforeseen Circumstances, additional land, water, or financial compensation or additional restrictions on the use of land, water, or other natural resources will not be required without the consent of Permittees for the term of this Agreement, unless CDFG determines that the SCVHP is not being implemented consistent with the substantive terms of this Agreement, the SCVHP, and the State Permit.

The provisions of this Agreement and the SCVHP that address Changed Circumstances are not Unforeseen Circumstances and therefore are not subject to these assurances. However, CDFG acknowledges that the Changed Circumstances provisions of the SCVHP are not intended to require

modifications to the SCVHP that would impose significant additional burdens on Permittees or Third Party Participants.

### **12.3. Interim Obligations upon a Finding of Unforeseen Circumstances**

If a Wildlife Agency finds that an Unforeseen Circumstance has occurred with regard to a Covered Species and that additional mitigation measures are required for the Covered Species as a result, during the period necessary to determine the nature and location of the additional or modified mitigation, the Permittees will avoid causing an appreciable reduction in the likelihood of the survival and recovery of the affected species. The Permittees will not be responsible for implementing any additional mitigation measures or modifications, unless the Permittees consent to do so.

### **12.4. Section 7 Consultations regarding Covered Activities**

Nothing in this Agreement is intended to alter the obligation of a federal agency to consult with USFWS pursuant to Section 7 of the ESA (16 U.S.C. §1536(a)); the Parties understand that the assurances described in Agreement Section 12.1 cannot be provided to federal agencies. Unless otherwise required by law or regulation, in any consultation under Section 7 of the ESA involving the Permittees or an existing or prospective Third Party Participant and a proposed public or private project in the Permit Area that may adversely affect one or more Covered Species that are Federal Listed Species, USFWS will ensure that the biological opinion for the proposed project is consistent with the biological opinion issued for the SCVHP and the Federal Permit, provided that the proposed project and associated effects are consistent with the Covered Activities and effects analyzed in the SCVHP and the Federal Permit. Unless otherwise required by law or regulation, USFWS will not impose measures on a Permittee or an existing or prospective Third Party Participant in excess of those that have been or will be required by the Permits.

### **12.5. Assurances for Third Party Participants**

Pursuant to the “No Surprises” regulations described in Agreement Section 12.1, in the event of a finding of Unforeseen Circumstances, USFWS cannot require the commitment of additional land, water or financial compensation without the consent of the affected Permittee or Third Party Participant, provided that the Permittees have complied with their obligations under the Federal Permit. Likewise, as provided in Agreement Section 12.2, as long as the Permittees are properly implementing this Agreement, the SCVHP, and the State Permit, CDFG will not seek to impose on any Permittee or Third Party Participant, for purposes of compliance with the NCCPA or CESA, any avoidance, minimization, mitigation, or conservation measures or requirements regarding the impacts of Covered Activities on Covered Species within the Permit Area beyond those required by this Agreement, the SCVHP, and the State Permit. If there are Unforeseen Circumstances, additional land, water, or financial compensation or additional restrictions on the use of land, water, or other natural resources will not be required of a Third Party Participant without its consent for the term of this Agreement, unless CDFG determines that the SCVHP is not being implemented consistent with the substantive terms of this Agreement, the SCVHP, and the State Permit.

Nothing in this Agreement will preclude the Permittees from imposing on Third Party Participants any mitigation, compensation, or other requirements in excess of those required by the Permits for impacts other than impacts of Covered Activities on Covered Species. Such other impacts may include, but are not limited to, impacts on parks, recreational facilities, and agriculture.

### **13. FUNDING**

The Implementing Entity, County, Cities, Water District and VTA will ensure that all required mitigation, conservation, monitoring, and reporting measures are adequately funded throughout the term of this Agreement, and that certain monitoring, reporting and adaptive management measures are adequately funded in perpetuity. The Permittees do not intend to use, nor are they required to use, funds from their respective general funds to implement the SCVHP; rather they intend to obtain sufficient funds through a comprehensive strategy further described in SCVHP Chapter 9 that includes: fees and dedications from Covered Activities; federal and state grants; grants from nonprofits and foundations; and ongoing conservation efforts by local and state agencies that have a demonstrated record of acquiring and managing lands for conservation purposes in the Permit Area. The Permittees may use or establish other local funding measures, including, but not limited to, utility surcharges, special taxes or assessments, or bonds, to the extent allowed by law. The Permittees are responsible to seek all feasible increases in revenues that are necessary to keep pace with rising costs, as described in SCVHP Chapter 9. Each Permittee will promptly notify the Wildlife Agencies of any material change in the Permittee's financial ability to fulfill its obligations under this Agreement. In addition, the Implementing Entity will include in its Annual Report reasonably available financial information to demonstrate the Permittees' collective ability to fulfill their obligations under this Agreement in light of a material change in a Permittee's finances, if any.

As further provided in Agreement Section 18.8, this Agreement does not require the obligation, appropriation, or expenditure of any money without express authorization by, as applicable, the County Board of Supervisors, appropriate City Councils and/or governing boards of the Implementing Entity, Water District, and VTA.

#### **13.1. Funding for Management and Monitoring in Perpetuity**

As further described in SCVHP Chapter 9.4.4, the Permittees will manage the Reserve System in perpetuity in accordance with the requirements of the SCVHP, including applicable SCVHP adaptive management requirements and monitoring requirements. The Permittees anticipate that Reserve System management obligations will be fully funded by interest on the endowment created by the Endowment Fee, a component of the SCVHP Fees.

The Permittees' obligations with regard to SCVHP requirements other than Reserve System management requirements will terminate upon the termination of the Permits.

#### **13.2. Effect of Inadequate Funding**

In the event there is inadequate funding to implement the SCVHP, the Wildlife Agencies will assess the impact of the funding deficiency on the scope and validity of the Permits. Unless the Permittees

exercise the authority to withdraw, as provided in Agreement Section 17, or the Wildlife Agencies revoke the Permits, in whole or in part, as provided in Agreement Section 16, the Parties agree that they will meet and confer to develop a strategy to address the funding shortfall and to undertake all practicable efforts to maintain both the level of conservation provided under the SCVHP and the level of Authorized Take coverage afforded by the Permits until the funding deficiency can be remedied. The strategy to address a funding shortfall may include, but is not necessarily limited to, the actions described in SCVHP Chapter 9.4.4. However, the Permittees do not intend to, nor are they required to use, funds from their respective general funds to implement the SCVHP in the event of funding shortfalls, either in the short term or the long term.

If overall SCVHP fee revenues for the term of the Permits fall short of SCVHP projections because fewer Covered Activities are proposed or implemented, the resulting shortfall in SCVHP funding could prevent or constrain the Permittees' ability to implement the SCVHP fully. If it appears that the allowed Authorized Take will not be used during the term of the Permits, substantially reducing SCVHP fee revenues, the Parties anticipate that the Permittees will apply for an extension of the Permits in accordance with Agreement Section 17.4 to allow the full use of Authorized Take and full implementation of the SVHP, or will apply for a Permit modification or amendment in accordance with Agreement Section 15.5.

### **13.3. State and Federal Funding**

As further described in SCVHP Chapter 9.4.3, through the SCVHP and this Agreement, USFWS and CDFG will use their best efforts to contribute 14,900 acres of land, which will be administered, managed, and monitored by the Implementing Entity, to the Reserve System. The funds provided to acquire the 14,900 acres of land could come from a variety of sources, including funds administered directly by USFWS and CDFG, as well as funds administered by the Wildlife Conservation Board, the California Coastal Conservancy, California Department of Parks and Recreation, and other state and federal sources. If, after the exercise of all available authority and use of all available resources, state and federal funds are unable to contribute 14,900 acres to the Reserve System, the Implementing Entity, the Permittees, CDFG and USFWS will reevaluate the SCVHP and work together to develop or identify an alternative funding mechanism.

The Implementing Entity will track state and federal funds progress toward the goal of contributing 14,900 acres, measured by the number of acres added to the SCVHP Reserve System, and will include a summary of the progress in each report it prepares under Agreement Section 14.1. State and federal funds will be counted only toward that portion of the Reserve System that contributes to the recovery of Covered Species. If, for any acquisition of lands that are added to the Reserve System, state or federal funding is used to pay a portion of the overall acquisition costs, the number of acres counted toward this goal will be the portion of the total acres acquired that reflects the proportion of total acquisition costs paid with state or federal funds.

If a state or federal agency manages, or funds the management of, lands acquired with state or federal funds, the number of acres from state and federal funds contributing to the Reserve System will be reduced from 14,900 acres in recognition of the contribution of management funding, as

further described in SCVHP Chapter 9.4.3. The amount of the reduction will be accounted for by mutual agreement among USFWS, CDFG and the Implementing Entity.

## **14. REPORTING AND INFORMATION MANAGEMENT**

The Implementing Entity, on behalf of the Permittees, will report on and manage information regarding SCVHP implementation as provided in this Section and further described in SCVHP Chapters 7 and 8.11. The Implementing Entity may delegate reporting and information management tasks in this Section and the SCVHP to other Parties or qualified third parties, including universities, scientists and other contractors. However, the Implementing Entity will remain solely responsible for ensuring implementation of such tasks, on behalf of the Permittees.

### **14.1. Annual Report**

The Implementing Entity will prepare an annual report on implementation of the SCVHP (the “**Annual Report**”), as further described in SCVHP Chapter 8.11. The Annual Report will summarize actions taken to implement the SCVHP during the previous calendar year and will be submitted to the Wildlife Agencies by March 15 of the following calendar year, beginning the calendar year after the first full calendar year of implementation. The Annual Report will: provide information necessary to demonstrate that the SCVHP is being implemented in accordance with the Permits; include or describe the applications and approvals for take authorization, including take authorizations for Covered Activities that are exempt from SCVHP Fees or Conditions; identify any significant problems encountered during implementation, including any Changed Circumstances or Unforeseen Circumstances, and any remedial measures taken; identify issues that require consultation with the Wildlife Agencies; and identify proposed Minor Modifications or Amendments that would support successful implementation of the SCVHP. The Implementing Entity will provide a copy of the Annual Report to all Parties. The Implementing Entity will also create and maintain an Internet website for the public distribution of information regarding SCVHP implementation and will post each Annual Report on the website.

### **14.2. Monitoring Results**

As provided in Agreement Section 11.1, the Implementing Entity will provide the results of compliance monitoring, effectiveness monitoring and targeted studies annually in the Annual Report. The Parties will use the results of the Implementing Entity’s monitoring to ensure that the SCVHP is being properly implemented and to measure the Implementing Entity’s progress toward the successful implementation of the SCVHP Conservation Strategy (SCVHP Chapter 5), as further described in SCVHP Chapters 7 and 8.10.2.

### **14.3. Information Management**

Within one (1) year after the adoption of the last implementing ordinance as provided in Agreement Section 7.4.1.3, the Implementing Entity will develop and maintain a comprehensive data repository for compliance tracking information and other relevant information regarding SCVHP implementation, as further described in SCVHP Chapter 8.10.1. The Implementing Entity will make the data repository accessible to the Parties, including the Wildlife Agencies. The Wildlife

Agencies will keep confidential sensitive species information to the extent permitted by the Freedom of Information Act, the California Public Records Act or other applicable laws. Subject to the California Public Records Act, the Implementing Entity may determine in its sole discretion whether to grant access to any information in the data repository to third parties, including Third Party Participants.

#### **14.4. Other Information**

Within thirty (30) days of receipt of a written request from the Wildlife Agencies, the Implementing Entity will provide any requested, non-confidential, non-proprietary information in its possession or control that is relevant for the purpose of assessing whether the Permittees are in compliance with the terms and conditions of the Permits. The Implementing Entity shall list and briefly describe each document withheld for containing confidential or proprietary information.

### **15. MODIFICATIONS AND AMENDMENTS**

The Parties may from time to time modify or amend the SCVHP, this Agreement, or the Permits, in accordance with this Section and the requirements of the ESA, the NCCPA, NEPA and CEQA.

#### **15.1. Administrative Changes**

The Parties understand that ordinary administration and implementation of the SCVHP will require minor variations in the way certain conservation actions are implemented. Such administrative changes, as described in SCVHP Chapter 10.3.1, will not require modification or amendment of this Agreement, the SCVHP, or the Permits, and will not require the prior approval of the Wildlife Agencies. Administrative changes to the SCVHP that may be approved pursuant to this Section include, but are not limited to, the examples described in SCVHP Chapter 10.3.1.

#### **15.2. Minor Modifications of the SCVHP**

The Implementing Entity may propose minor modifications, defined in SCVHP Chapter 10.3.2, to the SCVHP by providing written notice to all of the other Parties. Such notice will include a statement of the reason for the proposed modification and an analysis of its environmental effects, if any, including any effects on Covered Species. The Wildlife Agencies will each approve or disapprove proposed modifications within sixty (60) days of receipt of such notice or will explain in writing to the Implementing Entity why such approval or disapproval cannot be provided within sixty (60) days and will specify when such approval or disapproval will be provided. Proposed modifications will become effective upon the Wildlife Agencies' written approval. The Wildlife Agencies will not approve minor modifications to the SCVHP if they determine that such modifications would result in adverse effects on Covered Species or natural communities under the SCVHP that are significantly different from those analyzed in the SCVHP or would result in additional Take of Covered Species not analyzed in the SCVHP. If any Wildlife Agency disapproves a proposed modification, it may be proposed as an amendment of that Wildlife Agency's Permit as provided in Section 15.4.

Minor modifications of the SCVHP that may be approved pursuant to this Section include, but are not limited to, the examples of minor modifications described in SCVHP Chapter 10.3.2

### **15.3. Amendment of this Agreement**

This Agreement may be amended only with the written agreement of all Parties; provided, however, that any amendment or portion thereof pertaining to Private Project Participants, implementing ordinances under Agreement Section 7.4.1.3, or any other provision of this Agreement pertaining to the land use or other regulatory decisions of the Cities or County will not require the consent of the Water District or VTA.

### **15.4. Amendment of the SCVHP and the Permits**

The Permittees may substantially revise the SCVHP by obtaining the applicable Wildlife Agency's approval of an amendment, as described in SCVHP Chapter 10.3.3, to one or more of the Permits as provided in this Section and in accordance with all applicable laws and regulations, including but not limited to the ESA, NEPA, NCCPA and CEQA. The Implementing Entity will provide written notice to all of the other Parties of any proposed Permit amendment. Such notice will include a copy of any required application for the proposed amendment, a statement of the reason for the amendment and an analysis of its environmental effects, if any, including any effects on Covered Species. The Wildlife Agency will review and approve or disapprove the proposed Permit amendment in an expeditious manner, commensurate with the level of environmental review appropriate to the magnitude of the proposed amendment. Unless and until CDFG adopts regulations that set forth specific requirements for the amendment of NCCPA take authorizations, for purposes of proposed amendments to the State Permit CDFG will accept an application for a Permit amendment that meets the requirements of this Section and ESA requirements for an application for an amendment of an incidental take permit; provided, however, that CDFG's approval or disapproval of the proposed Permit amendment will be based on the requirements of the NCCPA and CEQA and not on the requirements of the ESA.

Revisions of the SCVHP that would require an amendment of one or more of the Permits include, but are not limited to, the examples described in SCVHP Chapter 10.3.3.

### **15.5. Modification or amendment of SCVHP Deadlines**

The Parties acknowledge that it is possible that, even over the full fifty (50) year term of the Permits, Covered Activities and Authorized Take might not occur to the extent projected in the SCVHP and that SCVHP Fee revenues might therefore fall short of projections. A shortfall of SCVHP Fee revenues under these circumstances could make it difficult or impossible for the Permittees to complete the Reserve System within the term of the Permits. If it appears likely that such a shortfall will make it difficult or impossible for the Implementing Entity and other Permittees to meet all SCVHP land acquisition requirements, and all Reserve System habitat restoration and creation requirements, within the timeframes required under Agreement Section 6.4.1, SCVHP Chapter 5.3.1 and SCVHP Chapter 8.12, the Parties anticipate that the Permittees may propose an amendment to the SCVHP, this Agreement, and the Permits to reduce the Authorized Take and Reserve System land acquisition and habitat restoration and creation requirements or to extend the term of the permits in order to allow full implementation of the SCVHP in accordance with all applicable laws and regulations, including but not limited to the ESA, NEPA, NCCPA and CEQA, as provided in

Agreement Section 15.4, SCVHP Chapter 9.4.4 and SCVHP Chapter 10.3.3. This Agreement does not obligate the Wildlife Agencies to approve any such amendment proposal.

#### **15.6. General Land Use and Regulatory Authority of the County and Cities**

The Parties acknowledge that the adoption and amendment of general plans, specific plans, community plans, zoning ordinances and other land use and regulatory ordinances, and the granting of land use entitlements or other regulatory permits by the County or Cities are matters within the sole discretion of the County or Cities and will not require amendments to the Permits, or the approval of other Parties to this Agreement. However, no such action by the County or Cities will alter or diminish their obligations under the Permits.

### **16. REMEDIES AND ENFORCEMENT**

Each Party will have all of the remedies available in equity (including specific performance and injunctive relief) and at law to enforce the terms of the Permits, and to seek redress for any breach or violation thereof; except that none of the Parties will be liable in damages to any other Party or to any other person or entity for any breach of this Agreement, any performance or failure to perform a mandatory or discretionary obligation imposed by this Agreement, or any other cause of action arising from this Agreement. The Parties acknowledge that the Covered Species are unique and that their loss as species would be irreparable and that therefore injunctive and temporary relief may be appropriate in certain instances involving a breach of this Agreement. Nothing in this Agreement is intended to limit the authority of the Federal and State governments to seek civil or criminal penalties or otherwise fulfill its enforcement responsibilities under the ESA, CESA or other applicable law.

#### **16.1. Suspension of Federal Permit**

USFWS may suspend the Federal Permit, in whole or in part, for cause in accordance with 50 Code of Federal Regulations section 13.27 and other applicable laws and regulations in force at the time of such suspension. Except where USFWS determines that emergency action is necessary to avoid irreparable harm to a Covered Species, it will not suspend the Federal Permit without first (1) attempting to resolve any disagreements regarding the implementation or interpretation of the SCVHP or this Agreement in accordance with Agreement Section 6.6, (2) requesting the Permittees to take appropriate remedial actions, and (3) providing the Permittees with written notice of the facts or conduct which may warrant the suspension and an adequate and reasonable opportunity for the Permittees to demonstrate why suspension is not warranted.

#### **16.2. Reinstatement of Suspended Federal Permit**

In the event USFWS suspends the Federal Permit, in whole or in part, as soon as possible after such suspension, USFWS will meet and confer with the Permittees concerning how the suspension can be ended. Subsequent to the conclusion of any such conference, USFWS will identify reasonable, specific actions, if any, necessary to effectively redress the suspension. In making this determination, USFWS will consider the requirements of the ESA and its regulations, the conservation needs of the Covered Species, the terms of the Federal Permit and any comments or

recommendations received during the meet and confer process. As soon as possible, but not later than thirty (30) days after the conference, USFWS will send the Permittees written notice of any available, reasonable actions necessary to effectively redress the deficiencies giving rise to the suspension. Upon performance or completion, as appropriate, of such actions, USFWS will immediately reinstate the Federal Permit. It is the intent of the Parties that in the event of any total or partial suspension of the Federal Permit, all Parties will act expeditiously and cooperatively to reinstate the Federal Permit.

### **16.3. Suspension of the State Permit**

In the event of any material violation of the State Permit or material breach of this Agreement by the Permittees, CDFG may suspend the State Permit in whole or in part; provided, however, that it will not suspend the State Permit without first (1) attempting to resolve any disagreements regarding the implementation or interpretation of the SCVHP or this Agreement in accordance with Agreement Section 6.6, (2) requesting the Permittees to take appropriate remedial actions when such remedial actions are reasonable and available, and (3) providing the Permittees with written notice of the facts or conduct which may warrant the suspension and an adequate and reasonable opportunity for the Permittees to demonstrate why suspension is not warranted or to take steps necessary to cure the violation or breach.

#### **16.3.1. Failure to Maintain Rough Proportionality**

As provided in Agreement Section 9.4.2, in the event that CDFG has determined that the Permittees have failed to meet the rough proportionality requirement as provided in Agreement Section 9.4, and if the Permittees have failed to cure the default or entered into an agreement to do so within forty-five (45) days of the written notice of such determination, CDFG will suspend the State Permit in whole or in part in accordance with California Fish and Game Code section 2820.

### **16.4. Reinstatement of Suspended State Permit**

In the event CDFG suspends the State Permit, as soon as possible but no later than ten (10) days after such suspension, CDFG will confer with the Permittees concerning how the violation or breach that led to the suspension can be remedied. At the conclusion of any such conference, CDFG will identify reasonable, specific actions necessary to effectively redress the violation or breach. In making this determination, CDFG will consider the requirements of NCCPA, the conservation needs of the Covered Species, the terms of the State Permit and this Agreement and any comments or recommendations received during the meet and confer process. As soon as possible, but not later than thirty (30) days after the conference, CDFG will send the Permittees written notice of the reasonable actions necessary to effectively redress the violation or breach. Upon performance of such actions, CDFG will immediately reinstate the State Permit. It is the intent of the Parties that in the event of any suspension of the State Permit, all Parties will act expeditiously and cooperatively to reinstate the State Permit.

### **16.5. Revocation of Federal Permit**

USFWS agrees that it will revoke or terminate the Federal Permit, in whole or in part, pursuant to 50 Code of Federal Regulations sections 13.28-13.29 and 50 Code of Federal Regulations sections

17.22(b)(8) and 17.32(b)(8) only after completing the meet and confer process set forth in Agreement Section 6.6, unless immediate revocation is necessary to avoid the likelihood of jeopardy to a listed species. USFWS agrees that it will not revoke or terminate the Federal Permit, in whole or in part, to avoid the likelihood of jeopardy to a listed species, without first notifying the Permittees of those measures, if any, that the Permittees may undertake to prevent jeopardy to the listed species and maintain the Federal Permit and giving Permittees a reasonable opportunity to implement such measures.

#### **16.6. Revocation of State Permit**

CDFG may revoke or terminate the State Permit for a material violation of the State Permit or material breach of this Agreement by the Permittees if the CDFG determines in writing that (1) such violation or breach cannot be effectively redressed by other remedies or enforcement action, or (2) revocation or termination is required to avoid jeopardizing the continued existence of a Covered Species and to fulfill a legal obligation of the CDFG under the NCCPA.

CDFG agrees that it will not revoke or terminate the State Permit without first (1) attempting to resolve any disagreements regarding the implementation or interpretation of the SCVHP or this Agreement in accordance with Agreement Section 6.6, (2) requesting that the Permittees take appropriate remedial action, and (3) providing the Permittees with notice in writing of the facts or conduct which warrant the revocation or termination and a reasonable opportunity (not less than forty-five (45) days) to demonstrate or achieve compliance with NCCPA, the State Permit and this Agreement.

However, in the event that CDFG has determined that the Permittees have failed to meet the rough proportionality standard provided in Agreement Section 9.4, and if the Permittees have failed to cure the default or to enter into an agreement to do so within forty-five (45) days of the written notice of such determination, CDFG will suspend or revoke the State Permit in whole or in part in accordance with California Fish and Game Code section 2820.

#### **16.7. Obligations in the Event of Suspension or Revocation**

In the event of revocation or termination of a Permit, or of suspension of a Permit pursuant to Agreement Section 16.8, consistent with the requirements of 50 Code of Federal Regulations sections 17.32(b)(7) and 17.22(b)(7), the Permittees will remain obligated to fulfill any existing and outstanding minimization and mitigation measures and conservation measures required under this Agreement, the SCVHP and the Permit for any Take that occurs prior to such revocation, termination, or suspension, until the applicable Wildlife Agency determines that all Take of Covered Species that occurred under the Permit has been mitigated to the maximum extent practicable in accordance with the SCVHP. Regardless of whether the Permit is terminated, suspended, or revoked, the Permittees acknowledge that lands added to the Reserve System must be protected, managed and monitored in perpetuity.

#### **16.8. Emergency Suspension of Permits to Avoid Jeopardy**

If new circumstances arise in which continued implementation of the Covered Activities would appreciably reduce the likelihood of survival and recovery of a Federal or State Listed Species in the

wild, USFWS or CDFG may suspend its Permit on an emergency basis, in whole or in part, without resorting to the procedures specified in this Section. The period of such emergency suspension will be no longer than ninety (90) days. Before extending the suspension beyond ninety (90) days, USFWS and CDFG will comply with the requirements of Agreement Section 16 pertaining to non-emergency Permit suspensions or revocations. During such 90-day period, USFWS will comply with 50 Code of Federal Regulations section 13.27.

#### **16.9. Force Majeure**

In the event that the Permittees are wholly or partially prevented from performing obligations under this Agreement because of unforeseeable causes beyond the reasonable control of and without the fault or negligence of the Permittees (“**Force Majeure**”), including, but not limited to, acts of God, labor disputes, sudden actions of the elements not identified as Changed Circumstances, or actions of non-participating federal or state agencies or local jurisdictions, the Permittees will be excused from whatever performance is affected by such unforeseeable cause to the extent so affected, and such failure to perform will not be considered a material violation or breach, provided that nothing in this section will be deemed to authorize any Party to violate the ESA, CESA or NCCPA, and provided further that:

- The suspension of performance is of no greater scope and no longer duration than is required by the Force Majeure;
- Within fifteen (15) days after the occurrence of the Force Majeure, affected Permittees will give the Wildlife Agencies written notice describing the particulars of the occurrence;
- Permittees will use their best efforts to remedy their inability to perform (however, this paragraph will not require the settlement of any strike, walk-out, lock-out or other labor dispute on terms which in the sole judgment of the Permittees are contrary to their interest); and
- When Permittees are able to resume performance of their obligations, the affected Permittees will give the Wildlife Agencies written notice to that effect.

#### **16.10. Inspections by Wildlife Agencies**

The Wildlife Agencies may conduct inspections and monitoring of the site of any Covered Activity, and may inspect any data or records required by the Permits, in accordance with applicable law and regulations. The Wildlife Agencies will also have reasonable access to conduct inspections of the Reserve System and lands enrolled under the Neighboring Lands Agreement.

### **17. TERM OF AGREEMENT**

#### **17.1. Effective Date**

This Agreement will be effective on the date after all of the following have occurred:

- Formation of the Implementing Entity;
- execution by all Parties;

- issuance of both of the Permits; and
- adoption of an SCVHP implementing ordinance by each of the Cities and the County.

#### **17.2. Term of the Agreement**

This Agreement will run for a term of fifty (50) years from the Effective Date, unless extended pursuant to Agreement Section 17.4, or unless all of the Permits are permanently terminated pursuant to Agreement Section 16, in which case this Agreement will automatically terminate. This Agreement may also be terminated by mutual written agreement of the Parties.

#### **17.3. Term of the Permits**

The Permits will run for a term of fifty (50) years from the date of issuance on the face of the Permits, unless terminated as provided in this Agreement.

#### **17.4. Extension of the Permits**

Upon agreement of the Parties and in compliance with all applicable laws and regulations in force at the time, the Wildlife Agencies may, with respect to the Permits under their respective jurisdictions, extend the Permits beyond their initial terms. If the Permittees desire to extend the Permits, they will so notify the Wildlife Agencies at least six (6) months before the then-current term is scheduled to expire. Extension of the Permits constitutes extension of this Agreement and the SCVHP for the same amount of time, subject to any modifications agreed to by the Parties at the time of extension.

#### **17.5. Withdrawal by a Permittee**

Upon ninety (90) days written notice to the Wildlife Agencies, the Implementing Entity and all other Permittees, any Permittee except for the Implementing Entity may unilaterally withdraw from this Agreement. As a condition of withdrawal, the Permittee will remain obligated to ensure implementation of all existing and outstanding minimization and mitigation and conservation measures required under the Permits for any Take that the Permittee itself caused and any Take by Private Project Participants for which the Permittee extended Authorized Take coverage prior to withdrawal. If a Permittee withdraws before causing or extending any Authorized Take coverage under the Permits, the Permittee will have no obligation to ensure implementation of any minimization or mitigation measures. Such withdrawal of a Permittee from this Agreement will be deemed to constitute a surrender of the Permittee's Authorized Take coverage under the Permits.

Withdrawal by a Permittee will not diminish or otherwise affect the obligations of the remaining Permittees under this Agreement, the SCVHP, or the Permits. The Permittees acknowledge that if one or more Permittees withdraws from this Agreement and, as a result of the withdrawal, it is no longer feasible or practicable to implement the SCVHP successfully, it may be necessary to modify the SCVHP or to amend the Permits, or both, in response to the withdrawal. However, the withdrawal of a Permittee will not, by itself, be sufficient cause for the Wildlife Agencies to revoke or suspend the Permits or take any other enforcement action.

Within forty-five (45) days after receiving written notice of withdrawal from a Permittee, the Wildlife Agencies, the Implementing Entity and all Permittees will meet to discuss and evaluate whether the SCVHP can be successfully implemented without the participation of the withdrawing

Permittee. Relevant factors in this evaluation include but are not limited to whether, without the participation of the withdrawing Permittee, SCVHP implementation will continue to be adequately funded, whether the Permittees can continue to comply with the stay-ahead requirement, whether all required conservation actions can be implemented, and whether the overall SCVHP Conservation Strategy can be implemented consistent with the SCVHP. Based on this meeting or meetings, and based on any other relevant information provided by the Implementing Entity or the remaining Permittees, the Parties will determine whether it is necessary to modify the SCVHP or amend the Permits, or both, in response to the withdrawal.

Upon ninety (90) days written notice to USFWS and CDFG, the Permittees collectively may withdraw from this Agreement. As a condition of such withdrawal, the Permittees will be obligated to ensure implementation of all existing and outstanding minimization, mitigation, and conservation measures required under the Permits for any Take that occurred prior to such withdrawal, to the maximum extent practicable pursuant to 50 C.F.R. 17.22(b)(7) and 17.32(b)(7) for the Federal Permit, and pursuant to Fish and Game Code sections 2820, 2821 and 2834 for the State Permit, until:

(1) The applicable Wildlife Agencies determine that all Take of Covered Species that occurred under the Permits has been mitigated in accordance with the SCVHP, which determination the Wildlife Agencies will make as soon as reasonably possible. The conservation measures required for Take that occurred prior to withdrawal are the same as the conservation measures required to comply with the rough proportionality requirement, in accordance with Agreement Section 9.4 and SCVHP Chapter 8.6.1, with regard to Take that occurred prior to withdrawal; and

(2) The Wildlife Agencies, the Implementing Entity and all Permittees meet to identify and evaluate activities that could voluntarily be undertaken or continued in support of the SCVHP Conservation Strategy notwithstanding the collective withdrawal.

If the Permittees collectively notify USFWS in writing that they plan to withdraw from this Agreement or to discontinue the Covered Activities, they will surrender: (1) the Federal Permit issued by that agency pursuant to the requirements of 50 Code of Federal Regulations Part 13.26; and (2) the State Permit pursuant to Fish and Game Code section 2835 including but not limited to the assurances or authorization for any Take that has not occurred at the time of withdrawal.

Regardless of withdrawal and surrender of the Permits, the Permittees acknowledge that lands in the Reserve System must be protected, managed and monitored in perpetuity.

## **18. MISCELLANEOUS PROVISIONS**

### **18.1. Calendar Days**

Throughout this Agreement and the SCVHP, the use of the term “day” or “days” means calendar days, unless otherwise specified

## 18.2. Response Times

Except as otherwise set forth herein or as statutorily required by CEQA, NEPA, CESA, ESA, NCCPA or any other laws or regulations, the Wildlife Agencies and the Permittees will use reasonable efforts to respond to written requests from a Party within a forty-five (45) day time period. The Parties acknowledge that the Cities and the County are subject to the Permit Streamlining Act and that nothing in this Agreement will be construed to require them to violate that Act. In addition, the Wildlife Agencies will provide timely review of proposals for Covered Activities to be implemented directly by the Permittees, where such review is required by the Permits.

## 18.3. Notices

The Implementing Entity will maintain a list of individuals responsible for ensuring SCVHP compliance for each of the Parties, along with addresses at which those individuals may be notified ("Notice List"). The Notice List as of the Effective Date is provided below. Each Party will report any changes of names or addresses to the Implementing Entity and the other Parties in writing.

Any notice permitted or required by this Agreement will be in writing, and delivered personally, by overnight mail, or by United States mail, postage prepaid. Notices may be delivered by facsimile or electronic mail, provided they are also delivered by one of the means listed above. Delivery will be to the name and address of the individual responsible for each of the Parties, as stated on the most current Notice List.

Notices will be transmitted so that they are received within deadlines specified in this Agreement, where any such deadlines are specified. Notices delivered personally will be deemed received on the date they are delivered. Notices delivered via overnight delivery will be deemed received on the next business day after deposit with the overnight mail delivery service. Notices delivered via non-certified mail will be deemed received seven (7) days after deposit in the United States mail. Notices delivered by facsimile or other electronic means will be deemed received on the date they are received.

The following Notice List contains the names and notification addresses for the individuals currently responsible for overseeing and coordinating SCVHP compliance:

<b><u>County:</u></b> County Executive County of Santa Clara 70 W. Hedding Street, 11 <sup>th</sup> Floor, East Wing San Jose, CA 95110	<b><u>San Jose:</u></b> City Manager City of San Jose 200 East Santa Clara Street San Jose, CA 95112
<b><u>Gilroy:</u></b> City Administrator City of Gilroy 7351 Rosanna St. Gilroy, CA 95020	<b><u>Morgan Hill:</u></b> City Manager City of Morgan Hill 17575 Peak Avenue Morgan Hill, CA 95037

<b>Water District:</b> Chief Executive Officer Santa Clara Valley Water District 5750 Almaden Expressway San Jose, CA 95118	<b>VTa:</b> General Manager Santa Clara Valley Transportation Authority 3331 N. First Street San Jose, CA 95134
<b>Implementing Entity:</b>	

#### **18.4. Entire Agreement**

This Agreement, together with the SCVHP and the Permits, constitutes the entire agreement among the Parties. This Agreement supersedes any and all other agreements, either oral or in writing, among the Parties with respect to the subject matter hereof and contains all of the covenants and agreements among them with respect to said matters, and each Party acknowledges that no representation, inducement, promise of agreement, oral or otherwise, has been made by any other Party or anyone acting on behalf of any other Party that is not embodied herein.

#### **18.5. Limitations on Remedies**

Notwithstanding any language to the contrary in this Agreement, this Agreement is not intended to create, and shall not be construed to create, any rights or remedies against the Wildlife Agencies for money damages or any other relief, including specific performance, that would result in a violation of the ESA, the NCCPA or any other federal or state law or regulation. No Party to this Agreement shall be liable in damages to any other Party or any other person for any performance or failure to perform any obligation identified in this Agreement

#### **18.6. Defense**

The USFWS and the Permittees acknowledge that the Permittee have a significant and independent interest in maintaining the validity and effectiveness of the SCVHP, this Agreement, and the Permit, and supporting documentation, including documentation under the National Environmental Policy Act and ESA, and that the Permittees' interests may not be adequately protected or represented in the event of a judicial challenge to the Permit unless some or all of the Permittees are able to participate in such litigation. Subject to Agreement Section 18.9 (Availability of Funds), the USFWS will, upon the request of the Permittees, and subject to the responsibilities of the U.S. Department of Justice in the conduct of litigation, use reasonably available resources to provide appropriate support to the Permittees in defending, consistent with the terms of the Federal Permit, lawsuits against the Permittees arising out of the USFWS's approval of the Federal Permit.

Upon request, CDFG will, to the extent authorized by California law, cooperate with the Permittees in defending, consistent with the terms of the SCVHP, lawsuits arising out of the Permittees' adoption of this Agreement and the SCVHP.

#### **18.7. Attorneys' Fees**

If any action at law or equity, including any action for declaratory relief, is brought to enforce or interpret the provisions of this Agreement, each Party to the litigation will bear its own attorneys'

fees and costs, provided that attorneys' fees and costs recoverable against the United States will be governed by applicable federal law.

#### **18.8. Elected Officials Not to Benefit**

No member of, or delegate to, the California State Legislature, the United States Congress, the County Board of Supervisors, the city councils of the respective Cities, or the governing boards of the other Permittees will be entitled to any share or part of this Agreement or to any benefit that may arise from it.

#### **18.9. Availability of Funds**

Implementation of this Agreement and the SCVHP by USFWS is subject to the requirements of the Anti-Deficiency Act and the availability of appropriated funds. Nothing in this Agreement will be construed by the Parties to require the obligation, appropriation, or expenditure of any money from the United States Treasury. The Parties acknowledge and agree that USFWS will not be required under this Agreement to expend any federal agency's appropriated funds unless and until an authorized official of that agency affirmatively acts to commit to such expenditures as evidenced in writing.

Implementation of this Agreement and the SCVHP by CDFG is subject to the availability of appropriated funds. Nothing in this Agreement will be construed by the Parties to require the obligation, appropriation, or expenditure of any money from the Treasury of the State of California. The Parties acknowledge and agree that CDFG will not be required under this Agreement to expend any state appropriated funds unless and until an authorized official of that agency affirmatively acts to commit such expenditure as evidenced in writing.

Implementation of this Agreement and the SCVHP by the Permittees is subject to the availability of their respective appropriated funds, including but not limited to the special purpose revenues dedicated to implement the SCVHP. Nothing in this Agreement will be construed to require the obligation, appropriation, or expenditure of any money without express authorization by the County Board of Supervisors, appropriate City Councils and/or governing boards of the Implementing Entity, Water District, and VTA. Notwithstanding these requirements and limitations, the Permittees are required to fund their respective obligations under the Permits as provided in Agreement Section 13. The Parties acknowledge that if the Permittees fail to provide adequate funding for their respective obligations under the Permits, the Permits may be suspended or revoked as provided in Agreement Section 16.

#### **18.10. Governing Law**

This Agreement will be governed by and construed in accordance with the laws of the United States and the State of California, as applicable.

#### **18.11. Duplicate Originals**

This Agreement may be executed in any number of duplicate originals. A complete original of this Agreement will be maintained in the official records of each of the Parties hereto.

#### **18.12. Relationship to the ESA, CESA, NCCPA and Other Authorities**

The terms of this Agreement are consistent with and will be governed by and construed in accordance with the ESA, CESA, NCCPA and other applicable state and federal laws. In particular, nothing in this Agreement is intended to limit the authority of USFWS and CDFG to seek penalties or otherwise fulfill its responsibilities under the ESA, CESA and NCCPA. Moreover, nothing in this Agreement is intended to limit or diminish the legal obligations and responsibilities of USFWS as an agency of the federal government or CDFG as an agency of the State of California.

#### **18.13. No Third Party Beneficiaries**

Without limiting the applicability of rights granted to the public pursuant to the ESA, CESA, NCCPA or other applicable law, this Agreement will not create any right or interest in the public, or any member thereof, as a third party beneficiary thereof, nor will it authorize anyone not a Party to this Agreement to maintain a suit for personal injuries or property damages under the provisions of this Agreement. The duties, obligations, and responsibilities of the Parties to this Agreement with respect to third party beneficiaries will remain as imposed under existing state and federal law.

#### **18.14. References to Regulations**

Any reference in this Agreement, the SCVHP, or the Permits to any regulation or rule of the Wildlife Agencies will be deemed to be a reference to such regulation or rule in existence at the time an action is taken.

#### **18.15. Applicable Laws**

All activities undertaken pursuant to the Permits must be in compliance with all applicable local, state and federal laws and regulations.

#### **18.16. Severability**

In the event one or more of the provisions contained in this Agreement is held to be invalid, illegal or unenforceable by any court of competent jurisdiction, such portion will be deemed severed from this Agreement and the remaining parts of this Agreement will remain in full force and effect as though such invalid, illegal, or unenforceable portion had never been a part of this Agreement. The Permits are severable such that revocation of one of the Federal or State Permits does not automatically cause revocation of the other. For example, if CDFG revokes the State Permit, it does not automatically cause revocation of the Federal Permit.

#### **18.17. Due Authorization**

Each Party represents and warrants that (1) the execution and delivery of this Agreement has been duly authorized and approved by all requisite action, (2) no other authorization or approval, whether of governmental bodies or otherwise, will be necessary in order to enable it to enter into and comply with the terms of this Agreement, and (3) the person executing this Agreement on behalf of each Party has the authority to bind that Party.

**18.18. Assignment**

Except as otherwise provided herein, the Parties will not assign their rights or obligations under this Agreement, the Permits, or the SCVHP to any other individual or entity.

**18.19. Headings**

Headings are used in this Agreement for convenience only and do not affect or define the Agreement's terms and conditions.

**18.20. Legal Authority of USFWS**

USFWS enters into this Agreement pursuant to the ESA, the Fish and Wildlife Coordination Act, and the Fish and Wildlife Act of 1956. Section 10(a) of the ESA expressly authorizes USFWS to issue permits to allow the incidental Take of species listed as threatened or endangered under the ESA.

**18.21. Legal Authority of CDFG**

CDFG enters into this Agreement pursuant to the NCCPA.

**18.22. No Limitation on the Police Power of the Cities or the County**

Nothing in this Agreement, the SCVHP or Permits limits the exercise of or in any way surrenders the police power of the Cities or the County.

**IN WITNESS WHEREOF, THE PARTIES HERETO** have executed this Implementing Agreement to be in effect as of the Effective Date.

MODEL IMPLEMENTING ORDINANCE

## EXHIBIT B

### MODEL IMPLEMENTING ORDINANCE

ORDINANCE NO. \_\_\_\_\_

**AN ORDINANCE OF THE [NAME OF COUNCIL/BOARD] ADDING [TITLE/CHAPTER #] TO THE [NAME OF ENTITY] CODE ADOPTING BY REFERENCE AND IMPLEMENTING THE SANTA CLARA VALLEY HABITAT CONSERVATION PLAN/NATURAL COMMUNITY CONSERVATION PLAN INCLUDING AUTHORITY TO COLLECT THE LOCAL DEVELOPMENT MITIGATION FEES ADOPTED BY THE SANTA CLARA VALLEY HABITAT AGENCY FROM PROJECT APPLICANTS AND REMIT THE FEES TO THE AGENCY FOR FUNDING THE PRESERVATION OF NATURAL ECOSYSTEMS IN ACCORDANCE WITH THE PLAN**

**WHEREAS**, the Santa Clara Valley Habitat Conservation Plan/Natural Communities Conservation Plan (“HCP/NCCP”) has been developed to preserve the ecosystems of the southeastern portion of Santa Clara County, which include the [Name of Entity] (“[City/County]”), the central portion of the Santa Clara Valley, portions of the Santa Cruz Mountains to the west, portions of the Diablo Range to the east, the Coyote watershed and portions of the Pajaro watershed, and a significant portion of the Guadalupe watershed (“Plan Area”) to conserve and prevent further endangerment of the plant and animal species that are dependent upon those ecosystems and to comply with federal and state legal requirements for such preservation; and

**WHEREAS**, the HCP/NCCP was drafted by the County of Santa Clara, the Cities of Gilroy, Morgan Hill, and San Jose, the Santa Clara Valley Water District, and the Santa Clara Valley Transportation Authority (collectively the “Local Partners”) in association with the U.S. Fish and Wildlife Service and the California Department of Fish and Game, and in consultation with stakeholder groups and the general public; and

**WHEREAS**, the County of Santa Clara and the Cities of Gilroy, Morgan Hill, and San Jose formed the Santa Clara Valley Habitat Agency, a joint powers agency (“Implementing Entity”), to implement the HCP/NCCP on behalf of the Local Partners, obtain long-term authorized Take coverage through permits from the U.S. Fish and Wildlife Service and the California Department of Fish and Game for the Local Partners’ own activities, and extend such authorized Take coverage to private project applicants under their jurisdiction; and

**WHEREAS**, the HCP/NCCP was adopted by the [Council/Board] on \_\_\_\_\_, 201\_; and

**WHEREAS**, the purpose and intent of this ordinance is to:

- protect vegetation communities and natural areas within the Plan Area which are known to support threatened, endangered, or key sensitive populations of plant and wildlife species;
- enable the [City/County] to achieve the conservation goals set forth in the HCP/NCCP;
- protect the existing character of the [City/County] and the region through the implementation of a system of reserves which will provide for permanent open space, community edges, and habitat conservation for species covered by the HCP/NCCP;

- preserve the ability of affected property owners to make reasonable use of their land consistent with the requirements of applicable laws, which include but are not limited to the National Environmental Policy Act ("NEPA") (42 U.S.C. §§ 4321-4347), the California Environmental Quality Act ("CEQA") (Public Resources Code § 21000 *et seq.*), the Federal Endangered Species Act ("ESA") (16 U.S.C. §§ 1531-1544), the California Endangered Species Act ("CESA") (Fish & Game Code § 2050 *et seq.*), and the California Natural Community Conservation Planning Act ("NCCPA") (Fish & Game Code §§ 2800-2835);
- insure the collection of the Implementing Entity's local development mitigation fees to assist in the maintenance of biological diversity and the natural ecosystem processes that support this diversity; and
- maintain economic development within the [City/County] by providing a streamlined regulatory process from which development can proceed in an orderly process; and

**WHEREAS**, the [Name of Entity] General Plan, adopted by the [Council/Board] on [Date], ("General Plan") contemplates the adoption of the HCP/NCCP, incorporates the goals of the HCP/NCCP, and includes specific strategies to further the goals of the HCP/NCCP as follows:

[Add list of General Plan consistency findings – see section 2.1 of HCP/NCCP for possible language]

**WHEREAS**, the findings set forth herein are based on the [City's/County's] General Plan, the HCP/NCCP and the studies referenced therein, and the estimated acquisition, management and maintenance costs for such property as set forth in the HCP/NCCP (a copy of the HCP/NCCP is on file in the [City/County] Clerk's office); and

**WHEREAS**, the California Constitution authorizes the [City/County] to enact measures that protect the health, safety, and welfare of its citizens; and

**WHEREAS**, Government Code section 66000 *et seq.* authorizes the Implementing Entity to impose fees and other exactions to provide necessary funding for public facilities required to mitigate the negative effect of new development projects within the Plan Area; and

**WHEREAS**, in accordance with the Implementing Agreement, the Implementing Entity may authorize the [City/County] to collect such fees from project applicants on behalf of the Implementing Entity and remit them to the Implementing Entity; and

**WHEREAS**, on \_\_\_\_\_, 201\_, the [Council/Board] certified the Draft Environmental Impact Report/Environmental Impact Statement for the HCP/NCCP project and made appropriate findings pursuant to CEQA and NEPA under File No. \_\_\_\_\_.

**NOW, THEREFORE, BE IT ORDAINED BY THE [COUNCIL/BOARD] OF THE [NAME OF ENTITY]:**

**SECTION 1.** [Title/Chapter] \_\_\_\_\_ is hereby added to the [Name of Entity] Code to read as follows:

**[TITLE/CHAPTER] \_\_\_\_\_  
HABITAT CONSERVATION PLAN**

**Sections:**

\_\_\_\_\_ **Purpose**

_____	<b>Adoption of Habitat Conservation Plan by Reference</b>
_____	<b>Definitions</b>
_____	<b>Application to Covered Activities</b>
_____	<b>Mitigation Fees</b>
_____	<b>Authorized Take Coverage</b>
_____	<b>Guidelines</b>
_____	<b>Interpretation</b>
_____	<b>Operative Date</b>

**Section \_\_\_\_\_ Purpose.**

The purpose of this [Title/Chapter] is to implement the Santa Clara Valley Habitat Conservation Plan/Natural Communities Conservation Plan (“HCP/NCCP”) and the associated Implementing Agreement and Take Permits in order to provide a regulatory framework for promoting the protection and recovery of natural resources, including Covered Species, while streamlining the permitting process for both publicly funded and privately funded planned development in the [Name of Entity]. The HCP/NCCP was developed by the County of Santa Clara, the Cities of Gilroy and Morgan Hill, the Santa Clara Valley Water District, and the Santa Clara Valley Transportation Authority (collectively the “Local Partners”) in association with the U.S. Fish and Wildlife Service and the California Department of Fish and Game, and in consultation with stakeholder groups and the general public.

As a result of the adoption of the HCP/NCCP by the [City/County], the [City/County] (among the other Local Partners) is the recipient of long-term endangered species permits/authorized Take coverage from the U.S. Fish and Wildlife Service and the California Department of Fish and Game for the [City’s/County’s] own activities and, in addition to coverage of its own public projects, the [City/County] will be able to extend authorized Take coverage to private Project Applicants under its jurisdiction.

Rather than separately permitting and mitigating individual projects, the HCP/NCCP evaluates natural resource impacts and mitigation requirements comprehensively in a manner that is more efficient and effective for at-risk species and their essential habitats. This approach will allow the [City/County] to streamline future mitigation requirements into one comprehensive program. The U.S. Fish and Wildlife Service (“USFWS”) the California Department of Fish and Game (“CDFG”) authorized Take coverage also provides assurances that no further commitments of funds, land, or water from covered public and private projects will be required to address impacts on Covered Species beyond that described in the HCP/NCCP to address changed circumstances as long as the HCP/NCCP is properly implemented..

In addition to strengthening local control over land use and species protection, the HCP/NCCP provides a more efficient process for protecting natural resources by creating new habitat reserves that will be larger in scale, more ecologically valuable, and easier to manage than the individual mitigation sites created under the current approach. This more efficient and streamlined approach to obtaining authorized Take coverage for both public and private projects will significantly reduce the time and resources previously required to obtain Take coverage on an individual project-by-project basis. Unless an activity is deemed to be in compliance with the federal and state Endangered Species Acts by the Implementing Entity, as described in Chapter 6.2 of the HCP/NCCP, all covered activities occurring within the Local Plan Area will be subject to applicable conditions and fees described in the HCP/NCCP.

**Section \_\_\_\_\_ Adoption of Habitat Conservation Plan/Natural Communities Conservation Plan by Reference.**

The HCP/NCCP is incorporated by reference as though fully set forth herein. Complete copies of the HCP/NCCP are available for inspection at the Office of the [City/County] Clerk and the [Name of Administering Department].

**Section \_\_\_\_\_ Definitions.**

The definitions set forth in this section shall govern the application and interpretation of this [Title/Chapter]. Words and phrases not defined in this section shall be interpreted so as to give this [Title/Chapter] its most reasonable application.

A. "Building Permit" includes a full structural building permit as well as a partial permit such as a foundation-only permit, grading permit, or any other permit or approval for a project authorizing a ground-disturbing activity for a Covered Activity.

B. "Covered Activity" means any activity defined in Section 2.3 of Chapter 2 of the HCP/NCCP as a covered activity and not otherwise exempted from the requirements of the HCP/NCCP.

C. "Covered Species" means the species, listed and non-listed, whose conservation and management are provided for in the HCP/NCCP and for which incidental Take is authorized by the Wildlife Agencies pursuant to the Take Permits. Covered Species are also listed in Exhibit A to the Implementing Agreement.

D. "Habitat Conservation Plan/Natural Communities Conservation Plan" or "HCP/NCCP" means the Santa Clara Valley Habitat Conservation Plan/Natural Communities Conservation Plan adopted by the [Council/Board] on \_\_\_\_\_, 201\_, and any amendments thereto.

E. "Implementing Agreement" means that agreement made and entered into by and among the United States Fish and Wildlife Service ("USFWS") of the United States Department of the Interior, the California Department of Fish and Game ("CDFG") of the State of California Natural Resources Agency, the Santa Clara Valley Habitat Agency (the "Implementing Entity"), the County of Santa Clara ("County"), the City of San Jose ("San Jose"), the City of Gilroy ("Gilroy"), the City of Morgan Hill ("Morgan Hill"), the Santa Clara Valley Water District ("Water District"), and the Santa Clara Valley Transportation Authority ("VTA") that defines the parties' respective roles and responsibilities and provides a common understanding of actions that will be undertaken to implement the HCP/NCCP.

F. "Implementing Entity" means the Santa Clara Valley Habitat Agency formed on \_\_\_\_\_, 201\_, by and among the County of Santa Clara and the Cities of Gilroy, Morgan Hill, and San Jose pursuant to the Joint Powers Act, Gov. Code § 6500 et seq.

G. "Local Plan Area" means that portion of the geographic study area defined in the HCP/NCCP that lies within the [corporate boundaries/unincorporated area] of the [Name of Entity].

H. "Mitigation Fees" or "Fees" means any Habitat Plan fee(s) that applies to Covered Activities in the Local Plan Area as adopted by the Implementing Entity in accordance with Chapter 9 of the HCP/NCCP and the fee studies in support thereof, and any amendments to those fees, unless otherwise exempted from the fee requirements of the HCP/NCCP by the Implementing Entity.

I. "Planning Permit" means any discretionary permit that authorizes a ground disturbing activity for a Covered Activity including, but not limited to, [list each agency's applicable discretionary land use approvals here, such as tentative map, parcel map, conditional use permit, site development permit, planned development permit, or special use permit], or any other discretionary permit, excluding general plan amendments, zoning and rezoning, annexation, specific plans, and area development policies. The term "Planning Permit" also includes any Building Permit where no other Planning Permit is required.

J. "Project Applicant" means any person or entity applying for a Planning Permit for a project authorizing a ground-disturbing activity for a Covered Activity, including any person or entity opting in to the HCP/NCCP pursuant to Chapter 6.2 of the HCP/NCCP.

K. "Take" and "Taking" have the same meaning provided by the Federal Endangered Species Act ("ESA") (16 U.S.C. §§ 1531-1544) and its implementing regulations with regard to

activities subject to the ESA, and also have the same meaning provided in section 86 of the California Fish and Game Code with regard to activities subject to the California Endangered Species Act ("CESA") (Fish & Game Code § 2050 *et seq.*), and the California Natural Community Conservation Planning Act ("NCCPA") (Fish & Game Code §§ 2800-2835).

L. "Take Permits" means the federal incidental Take permit issued by USFWS to the Implementing Entity, the County, San Jose, Gilroy, Morgan Hill, the Water District, and VTA (collectively, "Permittees") based on the HCP/NCCP pursuant to Section 10(a)(1)(B) of the ESA, and the state incidental Take permit issued by CDFG to the Permittees based on the HCP/NCCP pursuant to Section 2835 of the California Fish and Game Code.

#### **Section \_\_\_\_\_ Application to Covered Activities.**

All Project Applicants for Covered Activities within the Local Plan Area shall comply with the conditions on Covered Activities in Chapter 6 of the HCP/NCCP. Each Planning Permit application for a Covered Activity in the Local Plan Area shall include details of the methods and timing in which the project will comply with the HCP/NCCP in the form and manner required by the Director of [Name of Administering Department]. Applicable conditions on Covered Activities from Chapter 6 of the HCP/NCCP as well as other measures required to implement the conservation strategy of the HCP/NCCP shall be included in each Planning Permit approval for a Covered Activity.

#### **Section \_\_\_\_\_ Mitigation Fees.**

A. As a condition of each land use approval for a Covered Activity in the Local Plan Area, the Mitigation Fees shall be paid in full by the private Project Applicant to the [City/County] no later than the date of issuance by the [City/County] of a Building Permit. The Mitigation Fees shall be paid to the Implementing Entity at the time of issuance of the first Building Permit if more than one Building Permit is required for the project.

B. If the Implementing Entity authorizes another manner of compensation in lieu of the Mitigation Fees (such as a land donation in lieu of payment of the Mitigation Fees), the Project Applicant shall provide the [City/County] with written documentation from the Implementing Entity of compliance with such alternative manner of payment and the dollar equivalent amount of such alternative manner of compensation.

C. In the event the [City/County] determines the project subject to the Planning Permit to be exempt from payment of the Mitigation Fees, no Mitigation Fees shall be required for the project.

D. The [City/County] may collect the Mitigation Fees on behalf of the Implementing Entity if authorized to do so by the Implementing Entity.

#### **Section \_\_\_\_\_ Authorized Take Coverage.**

Upon payment in full of the Mitigation Fees and approval of Planning Permits incorporating all applicable HCP/NCCP conditions of approval, the Project Applicant shall receive authorized Take coverage for the Covered Activity in accordance with the terms of the HCP/NCCP, the Implementing Agreement, and the Take Permits.

#### **Section \_\_\_\_\_ Guidelines.**

The [Council/City Manager, in conjunction with the [Director of Planning/Planning, Building and Code Enforcement,]] may adopt guidelines to assist in the implementation and administration of all aspects of this [Title/Chapter].

#### **Section \_\_\_\_\_ Interpretation.**

In the event of a conflict between any term or requirement of this [Title/Chapter], the HCP/NCCP, the Implementing Agreement or the Take Permits, the term or requirement of the Take Permits shall govern.

**Section \_\_\_\_\_ Operative Date.**

This [Title/Chapter] shall be operative upon adoption by the Implementing Entity of the Mitigation Fees and the issuance of the Take Permits by the U.S. Fish and Wildlife Service and the California Department of Fish and Game.

[Include agency-specific adoption language and signature block]

EXHIBIT C  
NEIGHBORING LANDOWNER CERTIFICATE OF INCLUSION

## Exhibit C

### SANTA CLARA VALLEY HABITAT PLAN

#### NEIGHBORING LANDOWNER CERTIFICATE OF INCLUSION

The United States Fish and Wildlife Service and the California Department of Fish and Game have issued Permits pursuant to the federal Endangered Species Act and the California Natural Community Conservation Planning Act (collectively "Permits") authorizing "Take" of certain species in accordance with the terms and conditions of the Permits, the Santa Clara Valley Habitat Plan ("Habitat Plan") and the associated Implementing Agreement. Under the Permits, Section 10.2.7 of the Habitat Plan, and Section 7.4.3 of the Implementing Agreement, certain activities by the party or entity below are authorized to "Take" certain species (California red-legged frog, California tiger salamander, and Western pond turtle), provided all applicable terms and conditions of the Permits, the Habitat Plan, and the Implementing Agreement are met.

As the owner/operator of the property described by Assessor's Parcel Number and gross acres on Exhibit 1 attached thereto and incorporated herein by this reference, you are entitled to the protection of the Permits to Take those species identified in Section 7.4.3 in connection with normal agricultural practices occurring within a one mile of the boundary of Reserve System lands and with the limitations set forth in Section 10.2.7 of the Habitat Plan and Section 7.4.3 of the Implementing Agreement. In the event that the property depicted on Exhibit 1 is used for other purposes without the express consent of the Santa Clara Valley Habitat Agency, Take Authorization under the Permits will automatically cease. Such authorization is provided as described in the Permits, the Habitat Plan, and the Implementing Agreement. By signing this Certificate of Inclusion you signify your election to receive Take Authorization under the Permits in accordance with the terms and conditions thereof. This Certificate of Inclusion does not give state and federal agencies additional regulatory control over the signatory nor require the signatory to provide additional information not called for in the Certificate of Inclusion, but instead ensures compliance with 50 Code of Federal Regulations, section 13.25(d). Coverage under the Permits will become effective upon receipt of the fully-completed and executed Certificate of Inclusion by the Santa Clara Valley Habitat Agency. In the event that the subject property is sold or leased, buyer or lessee must be informed of these provisions and execute a new Certificate of Inclusion.

San Joaquin kit fox <i>Vulpes macrotis mutica</i>	ST	FE	Y	Y	Y	Y	Y	Known to occur occasionally at edges of study area (two records from 1975, Aug. 2002 record in Henry Coe State Park; CNDDDB 2005).
Plants								
Tiburon Indian paintbrush <i>Castilleja affinis</i> ssp. <i>neglecta</i>	ST/1B	FE	Y	Y	Y	Y	Y	Two occurrences west of Anderson Reservoir on Coyote Ridge (CNDDDB 2012).
Coyote ceanothus <i>Ceanothus ferrisiae</i>	1B	FE	Y	Y	Y	Y	Y	Study area includes all three known occurrences and habitat of species throughout range (CNDDDB 2012).
Mount Hamilton thistle <i>Cirsium fontinale</i> var. <i>campylon</i>	1B	–	Y	Y	Y	Y	Y	Forty occurrences in study area (CNDDDB 2012; T. Marker, pers. comm.).
Santa Clara Valley dudleya <i>Dudleya abramsii</i> ssp. <i>setchellii</i>	1B	FE	Y	Y	Y	Y	Y	Study area includes all known occurrences (207) and habitat of species throughout range (CNDDDB 2012; T. Marker, pers. comm.).
Fragrant fritillary <i>Fritillaria liliacea</i>	1B	–	Y	Y	Y	Y	Y	Eight occurrences on east side of Santa Clara Valley (CNDDDB 2012).
Loma Prieta hoita <i>Hoita strobilina</i>	1B	–	Y	Y	Y	Y	Y	Fourteen occurrences in study area (CNDDDB 2012).
Smooth lessingia <i>Lessingia micradenia</i> var. <i>glabrata</i>	1B	–	Y	Y	Y	Y	Y	Thirty-nine occurrences in study area (CNDDDB 2012).
Metcalf Canyon jewelflower <i>Streptanthus albidus</i> ssp. <i>albidus</i>	1B	FE	Y	Y	Y	Y	Y	Ten occurrences, mostly in Santa Clara Valley (CNDDDB 2012).
Most beautiful jewelflower <i>Streptanthus albidus</i> ssp. <i>peramoenus</i>	1B	–	Y	Y	Y	Y	Y	Thirty-nine occurrences in study area (CNDDDB 2012).

**Table C-1. Continued**

Species	Status <sup>a</sup>			Criteria <sup>b</sup>			Recommended	Notes
	State/ CNPS	Federal	Range	Status	Impact	Data	Covered Status <sup>c</sup>	
Notes:				<sup>b</sup> <b>Criteria</b>				
<sup>a</sup> <b>Status</b>				<b>Range:</b> The species is known to occur or is likely to occur within the study area, based on credible evidence, or the species is not currently known in the study area but is expected in the study area during the permit term (e.g., through range expansion or reintroduction to historic range).				
<b>State Status</b>				<b>Status:</b> The species is either:				
FP	=	Fully Protected.		<ul style="list-style-type: none"> <li>▪ listed under the federal ESA as threatened or endangered, or proposed for listing;</li> <li>▪ listed under CESA as threatened or endangered or a candidate for such listing, or listed under the Native Plant Protection Act as rare; or</li> <li>▪ expected to be listed under ESA or CESA within the permit term. Potential for listing during the permit term is based on current listing status, consultation with experts and Wildlife Agency staff, evaluation of species population trends and threats, and best professional judgment.</li> </ul>				
SE	=	State listed as endangered.		<b>Impact:</b> The species or its habitat would be adversely affected by covered activities or projects that may result in take of the species.				
ST	=	State listed as threatened.		<b>Data:</b> Sufficient data exist on the species' life history, habitat requirements, and occurrence in the study area to adequately evaluate impacts on the species and to develop conservation measures to mitigate these impacts to levels specified by regulatory standards.				
SR	=	State listed as rare.		Species proposed for coverage in the Plan were limited to those species for which impacts from covered activities were likely, in order to provide take authorization for the highest priority species. However, many other special-status species are expected to benefit from the Plan, as described in Chapter 5.				
CSC	=	California special concern species (July 2005 list).		<sup>c</sup> <b>Recommended Covered Status</b>				
<b>Federal Status</b>				Y= recommended as covered species in the Habitat Plan.				
MBTA	=	Migratory Bird Treaty Act.		N= not recommended for coverage in the Habitat Plan.				
FE	=	Federally endangered.						
FT	=	Federally threatened.						
FC	=	Candidate for federal listing.						
FPT	=	Federally proposed for threatened listing.						
FPD	=	Federally proposed for delisting.						
FD	=	Federally delisted.						
SOC	=	Species of Concern (National Marine Fisheries Service designation).						
<b>California Native Plant Society Ranking</b>								
1A	=	Presumed extinct in California.						
1B	=	Rare or endangered in California and elsewhere.						
2	=	Rare or endangered in California, more common elsewhere.						
3	=	Plants about which more information is needed.

**Table C-2. Species Considered but Not Recommended as Covered Species**

Species	Status <sup>a</sup>			Criteria <sup>b</sup>			Recommended Covered Status <sup>c</sup>	Notes
	State/ CNPS	Federal	Range	Status	Impact	Data		
Invertebrates								
Opler's longhorn moth <i>Adela oplerella</i>	–	–	Y	N	Y	Y	N	Common in serpentine habitats throughout study area; able to persist in very small (~0.1 ha) patches of habitat
Vernal pool fairy shrimp <i>Branchinecta lynchi</i>	–	FT	N	Y	N	Y	N	Study area outside of range or current distribution but may occur; no CNDDDB records; no known vernal pool habitat within study area
Vernal pool tadpole shrimp <i>Lepidurus packardii</i>	–	FE	N	Y	N	Y	N	No known vernal pool habitat within study area and no records listed in CNDDDB (2005)
San Francisco lacewing <i>Nothochrysa californica</i>	–	–	?	N	?	Y	N	Not expected to become listed during permit term
Unsilvered fritillary <i>Speyeria adiastrae adiastrae</i>	–	–	N	Y	N	N	N	Petition for federal listing was denied. Most viable populations have been extirpated in the study area (A. Launer pers. comm.) and it is unlikely to occur in the study area (Spencer et al. 2006); impact of covered activities uncertain; lack of data on habitat requirements and conservation needs
Callippe silverspot butterfly <i>Speyeria callippe callippe</i>	–	FE	N	Y	N	N	N	Coyote and Uvas/Llagas Watersheds outside of range or current distribution. Some have suggested that <i>S. callippe callippe</i> extends to study area, but local collections to date have been <i>S. c. comstocki</i> (A. Lauer pers. comm.)
Serpentine phalangid <i>Calcina serpentina</i>	–	–	N	N	Y	N	N	Not expected to become listed during permit term. All the other many phalangids (described and undescribed) in the study area are not likely to be listed (A. Launer pers. comm.)
Horn's micro-blind harvestman <i>Microcina horni</i>	–	–	Y	N	N?	N	N	Endemic to Santa Clara County; petitioned for listing in 1990 but rejected due to lack of data; impacts of covered activities uncertain
Jung's micro-blind harvestman <i>Microcina jungi</i>	–	–	Y	N	N?	N	N	Endemic to Santa Clara County; petitioned for listing in 1990 but rejected due to lack of data; impacts of covered activities uncertain
Ricksecker's water scavenger beetle <i>Hydrochara rickseckeri</i>	–	–	N	N	N	N	N	Not expected to become listed during permit term and not found in the study area
Bridges (= Coast Range) shoulderband <i>Helminthoglypta nickliniana bridgesi</i>	–	–	Y	N	Y	Y	N	Not expected to become listed during permit term

Table C-2. Continued

Species	Status <sup>a</sup>		Criteria <sup>b</sup>				Recommended Covered Status <sup>c</sup>	Notes
	State/ CNPS	Federal	Range	Status	Impact	Data		
California linderiella fairy shrimp <i>Linderiella occidentalis</i>	–	–	Y	N	?	Y	N	Not expected to become listed during permit term; study area within known range or current distribution
Curved-foot hygrotus diving beetle <i>Hygrotus curvipes</i>	–	–	N	N	?	Y	N	Not expected to become listed during permit term
San Francisco fork-tailed damselfly <i>Ischnura gemina</i>	–	–	Y	N	?	?	N	Unlikely to become listed during the permit term
California floater (a freshwater mussel) <i>Anodonta californiensis</i>	–	–	Y	N	N?	N	N	Unlikely to become listed over the permit term.
Monarch butterfly <i>Danaus plexippus</i>	–	–	N	N	N	Y	N	Roost sites not known to occur in the study area; not expected to become listed during permit term
Myrtle's silverspot butterfly <i>Speyeria zerene myrtleae</i>	–	FE	N	N	N	N	N	Study area outside of range or current distribution
<b>Fish</b>								
Sacramento perch (within native range) <i>Archoplites interruptus</i>	CSC	–	Y	N	Y	Y	N	Listing unlikely due to current population expansion outside of native range and native habitat type
Monterey roach <i>Lavinia symmetricus subditus</i>	CSC	–	Y	N	Y	Y	N	Abundant in Pajaro River, Llagas Creek, and Pacheco Creek (Spencer et al. 2006); unlikely to become listed during permit term
Central California coho salmon <i>Oncorhynchus kisutch</i>	SE (see note)	FE (see note)	N	Y	N	Y	N	State endangered status applies south of San Francisco Bay; federal status applies to naturally spawning populations in streams between Punta Gorda, Humboldt County and San Lorenzo River, Santa Cruz County. Coho salmon currently do not occur in the study area. A recent study of the historic occurrences of Coho in San Francisco Bay drainages found historic Coho occurrence in the upper Coyote Creek and Guadalupe River drainages as “probable” (Leidy et al. 2005). Given that Santa Clara County was at the southern edge of their range (Moyle 2002), they were likely never common in the south Bay. Recovery in this system is highly unlikely due to the presence of dams below likely spawning and rearing habitat.
Sacramento splittail <i>Pogonichthys macrolepidotus</i>	CSC	FD	N	Y	N	Y	N	Low abundance in South Bay, estuarine river reaches only (outside study area)

Table C-2. Continued

Species	Status <sup>a</sup>		Criteria <sup>b</sup>				Recommended Covered Status <sup>c</sup>	Notes
	State/ CNPS	Federal	Range	Status	Impact	Data		
Rainbow trout <i>Oncorhynchus mykiss</i>	–	–	Y	N	N	Y	N	Potential for landlocked populations within study area to become listed is low because Alameda Creek population was removed from listed ESU January 5, 2006
River lamprey <i>Lampetra ayresi</i>	CSC	–	Y?	N	Y	N	N	Not likely to become listed during permit term; biology and distribution not studied in California
Pacific lamprey <i>Lampetra tridentata</i>	–	–	Y	Y	Y	Y	N	Petition for federal listing; recently rejected but may be resubmitted. Section 10 coverage will be obtained for the SCVWD under the Three Creeks HCP. South County coverage to be obtained under amendment or separate permit.
South-Central California Coastal steelhead <i>Oncorhynchus mykiss</i>	CSC	FT	Y	Y	Y	Y	N	Occurs in Pajaro River and tributaries; suitable habitat occurs above Uvas Dam (CNDDDB 2005). Section 10 coverage for the SCVWD to be obtained under amendment or separate permit.
Central California Coastal steelhead <i>Oncorhynchus mykiss</i>	–	FT	Y	Y	Y	Y	N	Occurs in Coyote Creek and tributaries (CNDDDB 2005). Section 10 coverage for the SCVWD will be obtained under the Three Creeks HCP.
Central valley fall-run Chinook salmon <i>Oncorhynchus tshawytscha</i>	CSC	SOC	Y	Y?	Y	Y	N	Occurs in Guadalupe River; species was federal candidate but listing was not warranted per 1999 decision; NOAA considers population in study area to be of hatchery stock and not part of the listed ESU; due to increasing population numbers listing of this species is may be unlikely. Section 10 coverage for the SCVWD will be obtained under the Three Creeks HCP.
<b>Amphibians</b>								
Western spadefoot <i>Spea hammondi</i>	CSC	–	N	N	N	N	N	Recent comprehensive evaluations of survey data and museum specimens have concluded that this species has not historically or does not currently occur in Santa Clara County (see USFWS [2004] for a summary of these studies)
<b>Reptiles</b>								
Alameda whipsnake <i>Masticophis lateralis euryxanthus</i>	ST	FT	N	Y	N	Y	N	Southern edge of subspecies range is at the northern edge of Santa Clara County within SFPUC Alameda Watershed (covered by separate HCP); subspecies may intergrade with chaparral whipsnake (M. l. lateralis) at the southern edge of its range making identification difficult

Table C-2. Continued

Species	Status <sup>a</sup>		Criteria <sup>b</sup>				Recommended Covered Status <sup>c</sup>	Notes
	State/ CNPS	Federal	Range	Status	Impact	Data		
Silvery legless lizard <i>Anniella pulchra pulchra</i>	CSC	–	Y	N	Y	N	N	Suitable habitat may occur in the study area; not expected to become listed during permit term
San Joaquin coachwhip <i>Masticophis flagellum ruddocki</i>	CSC	–	N	N	N	Y	N	Not expected to become listed during permit term
California horned lizard <i>Phrynosoma coronatum frontale</i>	CSC	–	Y	N	Y	N	N	Not expected to become listed during permit term; USFWS and CDFG will not cover due to limited data on the species; taxonomy uncertain: recent study combined <i>P. c. frontale</i> and <i>P. c. schmidtii</i> into new species <i>P. blainvillii</i>
<b>Birds</b>								
Western grebe <i>Aechmophorus occidentalis</i>	–	–	Y	N	N	Y	N	Not expected to become listed during permit term
Golden eagle <i>Aquila chrysaetos</i>	FP	BGPA, MBTA	Y	Y	N	Y	N	Take of individuals and nests not allowed; unlikely to be affected by covered activities
Great blue heron (rookery) <i>Ardea herodias</i>	–	–	Y	N	N	Y	N	Not expected to become listed during permit term
California condor <i>Gymnogyps californianus</i>	SE/FP	FE	N	Y	N	Y	N	Species is fully protected; take of individuals not allowed; only known as a rare migrant in study area
Prairie falcon <i>Falco mexicanus</i>	CSC	–	Y	N	Y	Y	N	Not expected to become listed during permit term
American peregrine falcon <i>Falco peregrinus anatum</i>	SE/FP	FD	Y	Y	N	Y	N	Species is fully protected; take of individuals not allowed; not likely to be listed under the federal ESA because it was recently removed from the list; removal of limited habitat not expected to rise to the level of habitat take under the state ESA
Bald eagle <i>Haliaeetus leucocephalus</i>	SE/FP	FD, BGPA, MBTA	Y	Y	N?	Y	N	No breeding pairs known to occur in study area, but breeding range may expand; individuals occasionally winter at reservoirs in study area including Calero; species is fully protected but delisted by USFWS; impact of covered activities uncertain
Short-eared owl <i>Asio flammeus</i>	CSC	–	N	Y?	N	Y	N	Not likely to occur in study area due to lack of suitable habitat
Cooper's hawk <i>Accipiter cooperii</i>	CSC	–	Y	N	Y	Y	N	Not expected to become listed during permit term

Table C-2. Continued

Species	Status <sup>a</sup>		Criteria <sup>b</sup>				Recommended Covered Status <sup>c</sup>	Notes
	State/ CNPS	Federal	Range	Status	Impact	Data		
Osprey <i>Pandion haliaetus</i>	CSC	–	Y	N	Y	Y	N	Not expected to become listed during permit term
Sharp-shinned hawk <i>Accipiter striatus</i>	CSC	–	Y	N	Y	Y	N	Not expected to become listed during permit term
Northern harrier <i>Circus cyaneus</i>	CSC	–	Y	N	Y	Y	N	Not expected to become listed during permit term
Ferruginous hawk <i>Buteo regalis</i>	CSC	–	Y	N	Y	Y	N	Not expected to become listed during permit term
California black rail <i>Laterallus jamaicensis coturniculus</i>	ST/FP	–	N	Y	N	Y	N	Study area outside of range or current known distribution; suitable habitat in the study area is very limited and unlikely to support species
Western snowy plover <i>Charadrius alexandrinus nivosus</i>	CSC	FT	N	Y	N	Y	N	No suitable habitat in study area
Mountain plover <i>Charadrius montanus</i>	CSC	FPT	N	Y	N	Y	N	No suitable habitat in study area
Long-billed curlew <i>Numenius americanus</i>	CSC	–	N	N	N	Y	N	Not expected to become listed during permit term
Aleutian Canada goose <i>Branta canadensis leucopareia</i>	–	delisted	Y	N	N?	Y	N	Species in recovery, not expected to become relisted during permit term; rare wintering visitor to study area
Black tern <i>Chlidonias niger</i> (nesting colony)	CSC	–	N	N	N	Y	N	Not expected to become listed during permit term
California least tern <i>Sterna antillarum (albifrons) browni</i> (nesting colony)	SE/FP	FE	N	Y	N	Y	N	No suitable habitat in study area
American white pelican <i>Pelecanus erythrorhynchos</i>	CSC	–	Y	N	N	Y	N	Does not breed in study area; not expected to become listed during permit term
California horned lark <i>Eremophila alpestris actia</i>	CSC	–	Y	N	Y	Y	N	Not expected to become listed during permit term
Loggerhead shrike <i>Lanius ludovicianus</i>	CSC	–	Y	N	Y	Y	N	Not expected to become listed during permit term
White-tailed kite <i>Elanus leucurus</i>	FP	–	Y	N	N	Y	N	Species is fully protected; take of individuals not allowed; species relatively common in study area so not likely to be state or federally listed if fully protected designation is withdrawn

Table C-2. Continued

Species	Status <sup>a</sup>			Criteria <sup>b</sup>			Recommended Covered Status <sup>c</sup>	Notes
	State/ CNPS	Federal	Range	Status	Impact	Data		
Western yellow-billed cuckoo <i>Coccyzus americanus occidentalis</i>	ST	–	N	Y	N	Y	N	Not known to occur in the study area recently or historically
Willow flycatcher <i>Empidonax traillii</i> (various ssp.)	SE	FE (only ssp. <i>extimus</i> )	Y	Y	N	Y	N	Study area outside of breeding range of all willow flycatcher subspecies. Only migrant willow flycatchers are found within the study area. Chance for take is remote. The local migrant subspecies ( <i>brewsteri</i> and possibly <i>adastus</i> ) are not likely to be federally listed
Purple martin <i>Progne subis</i>	CSC	MBTA	N	Y	N	Y	N	Unlikely to breed in study area due to presence of European starlings and house sparrows (competitors) (Spencer et al. 2006); migrants occasionally forage in study area; likely to become listed during permit term. Species is protected under MBTA; take of individuals not allowed
Bank swallow <i>Riparia riparia</i>	ST	MBTA	Y	Y	N	Y	N	No records of breeding in the study area; historic breeding record from 1931 (CNDDDB 2005); currently known only as a rare migrant through area (Spencer et al. 2006), but breeds in nearby Salinas Valley. Species is protected under MBTA; take of individuals not allowed
Salt marsh common yellowthroat (= San Francisco yellowthroat) <i>Geothlypis trichas sinuosa</i>	CSC	MBTA	N	Y	N	N	N	Known to breed in Alviso in freshwater and brackish marshes (CNDDDB 2005, D. Padley pers. comm.). Taxonomy of subspecies breeding in study area is uncertain; efficacy of conservation measures within study area is also uncertain (Spencer et al. 2006). Species is protected under MBTA; take of individuals not allowed
Bell's sage sparrow <i>Amphispiza belli belli</i>	CSC	–	Y	N	Y	N	N	Unlikely to be listed during the permit term
<b>Mammals</b>								
Fringed myotis <i>Myotis thysanodes</i>	–	–	Y	N	Y	Y	N	Not expected to become listed during permit term
Pacific Townsend's (=western) big-eared bat <i>Corynorhinus townsendii townsendii</i>	CSC	–	Y	N	N	Y	N	Not expected to become listed during permit term and not likely to be impacted by covered activities
Long-eared myotis <i>Myotis evotis</i>	–	–	Y	N	N	Y	N	Not expected to become listed during permit term

Table C-2. Continued

Species	Status <sup>a</sup>		Criteria <sup>b</sup>				Recommended Covered Status <sup>c</sup>	Notes
	State/ CNPS	Federal	Range	Status	Impact	Data		
Long-legged myotis <i>Myotis volans</i>	–	–	Y	N	N	Y	N	Not expected to become listed during permit term
Yuma myotis <i>Myotis yumanensis</i>	–	–	Y	N	N	Y	N	Not expected to become listed during permit term
Greater western mastiff bat <i>Eumops perotis</i>	CSC	–	Y	N	N	Y	N	Not expected to become listed during permit term
Small footed myotis <i>Myotis ciliolabrum</i>	–	–	Y	N	N	Y	N	Not expected to become listed during permit term
Pallid bat <i>Antrozous pallidus</i>	CSC	–	Y	N	N	Y	N	Not expected to become listed during permit term
Red bat <i>Lasiurus blossevillii</i>	–	–	Y	N	Y	N	N	Unlikely to become listed during permit term; data on distribution and ecology in California insufficient for coverage (see Western Bat Working Group at <a href="http://www.wbwg.org">www.wbwg.org</a> for more information on this and other bats)
Hoary bat <i>Lasiurus cinereus</i>	–	–	?	N	?	Y	N	Unknown if species occurs in study area; one of the most widespread North American bats
Spotted bat <i>Euderma maculatum</i>	CSC	–	?	N	?	N	N	Unlikely to become listed during permit term; data on distribution and ecology insufficient; unknown if species occurs in study area
Berkeley kangaroo rat <i>Dipodomys heermanni berkeleyensis</i>	–	–	N	Y	N	N	N	Subspecies possibly extinct; historic distribution in Contra Costa and Alameda Counties with southernmost record at Calaveras Reservoir (1940); study area outside of historic range
San Francisco dusky-footed woodrat <i>Neotoma fuscipes annectens</i>	CSC	–	Y	N	N	Y	N	Not expected to become listed during permit term; most of study area outside range of subspecies
Mountain lion <i>Felis concolor</i>	–	–	Y	N	N	Y	N	Not expected to become listed during permit term
Ringtail <i>Bassariscus astutus</i>	FP	–	Y	N	N	Y?	N	Species is fully protected; take of individuals not allowed; species relatively common in study area so not likely to be state or federally listed if fully protected designation is withdrawn
American badger <i>Taxidea taxus</i>	CSC	–	Y	N	Y	Y	N	Not expected to become listed during permit term. Range is expanding outside California

Table C-2. Continued

Species	Status <sup>a</sup>		Criteria <sup>b</sup>				Recommended	
	State/ CNPS	Federal	Range	Status	Impact	Data	Covered Status <sup>c</sup>	Notes
Plants								
Chaparral harebell <i>Campanula exigua</i>	1B	–	Y	Y	N	Y	N	One occurrence in study area (CNDDDB 2012).
Woodland woollythreads <i>Monolopia gracilens</i>	1B	–	Y	N	Y	Y	N	Not expected to become listed during permit term
Big scale balsamroot <i>Balsamorhiza macrolepis</i> var. <i>macrolepis</i>	1B	–	Y	Y	N	Y	N	Two occurrences in Santa Clara Valley (CNDDDB 2012).
Franciscan onion <i>Allium peninsulare</i> var. <i>franciscanum</i>	1B	–	N	Y	N	Y	N	Outside of known range
Sharsmith’s onion <i>Allium sharsmithiae</i>	1B	–	N	Y	N	Y	N	Outside of known range
Bent-flowered fiddleneck <i>Amsinckia lunaris</i>	1B		N?	Y	N	Y	N	Occurrence in Santa Clara County along Kinkaid Road outside study area; no occurrences known from study area
Santa Cruz Manzanita <i>Arctostaphylos andersonii</i>	1B	–	Y	N	Y	Y	N	Two occurrences in study area (CNDDDB 2005); occurs near summit road near Mt. Madonna County Park. In Santa Cruz County, species often dominates chaparral where it occurs, so unlikely to be listed during permit term.
Kings Mountain Manzanita <i>Arctostaphylos regismontana</i>	1B	–	Y	Y	N	Y	N	One occurrence in study area (CNDDDB 2005)
Alkali milk-vetch <i>Astragalus tener</i> var. <i>tener</i>	1B	–	N	Y	N	Y	N	Outside of known range
San Joaquin saltbush <i>Atriplex joaquiniana</i>	1B	–	Y?	Y	N	Y	N	One historic occurrence at north end of Salinas Valley near County line (CNDDDB 2005)
Santa Cruz Mountains pussypaws <i>Calyptridium parryi</i> var. <i>hesseae</i>	1B	–	N	Y	N	N	N	Only Santa Clara County occurrence not in study area (CNDDDB 2005)
Sharsmith’s harebell <i>Campanula sharsmithiae</i>	1B	–	N	Y	N	Y	N	Outside of known range
Congdon’s tarplant <i>Centromadia parryi</i> ssp. <i>congdonii</i>	1B	–	Y	Y	N	Y	N	One historic occurrence in study area, extirpated (CNDDDB 2005); four other occurrences in the County along SF Bay
San Francisco Bay spineflower <i>Chorizanthe cuspidata</i> var. <i>cuspidata</i>	1B	–	N	Y	N	Y	N	Outside of known range

Table C-2. Continued

Species	Status <sup>a</sup>		Criteria <sup>b</sup>				Recommended Covered Status <sup>c</sup>	Notes
	State/ CNPS	Federal	Range	Status	Impact	Data		
Lost thistle <i>Cirsium praeteriens</i>	1A	–	N	Y	N	N	N	Outside of known range
San Francisco collinsia <i>Collinsia multicolor</i>	1B	–	Y	Y	Y?	Y	N	One occurrence in Anderson Reservoir basin
Point Reyes bird's-beak <i>Cordylanthus maritimus</i> ssp. <i>palustris</i>	1B	–	N	Y	N	Y	N	Out of known range
Mount Hamilton coreopsis <i>Leptosyne [Coreopsis] hamiltonii</i>	1B	–	Y	Y	N	Y	N	Unlikely to be affected by covered activities
Hospital Canyon larkspur <i>Delphinium californicum</i> ssp. <i>interius</i>	1B	–	N	Y	N	Y	N	Outside of known range
Western leatherwood <i>Dirca occidentalis</i>	1B	–	N	Y	N	Y	N	Outside of known range; one occurrence known from upper Saratoga Creek outside the study area
Brandegee's eriastrum <i>Eriastrum brandegeae</i>	1B	–	N	Y	N	N	N	Outside of known range
Tracy's eriastrum <i>Eriastrum tracyi</i>	SR/1B	–	N	Y	N	N	N	Outside of known range
Tiburon buckwheat <i>Eriogonum luteolum</i> var. <i>caninum</i>	3	–	N	Y	N	N	N	Outside of known range
Ben Lomond buckwheat <i>Eriogonum nudum</i> var. <i>decurrens</i>	1B	–	N	Y	N	Y	N	Outside of known range
Hoover's button-celery <i>Eryngium aristulatum</i> var. <i>hooveri</i>	1B	–	N?	Y	N	Y	N	One historic occurrence at north end of Salinas Valley by County line; known from Soap Lake in Santa Cruz County across county line
Talus fritillary <i>Fritillaria falcata</i>	1B	–	N	Y	N	Y	N	Out of known range
Delta tule pea <i>Lathyrus jepsonii</i> var. <i>jepsonii</i>	1B	–	N	Y	N	Y	N	Out of known range
Legenere <i>Legenere limosa</i>	1B	–	N?	Y	N	Y	N	Only Santa Clara occurrence is outside study area, on Timber Ridge (CNDDDB 2005) at edge of county in stock ponds that function as vernal pools (J. Hillman pers. comm.). 2002 occurrence on Coyote Ridge needs confirmation.

	State/ CNPS	Federal	Range	Status	Impact	Data		
Rock sanicle <i>Sanicula saxatilis</i>	SR/1B	–	N	Y	N	Y	N	One occurrence in Henry Coe State Park (CNDDDB 2012); also known from Mt. Hamilton on University of California and private land just outside study area; no impacts expected from covered activities.
Maple-leaved checkerbloom <i>Sidalcea malachroides</i>	1B	–	Y	Y	N	Y	N	One historic occurrence in study area, current status unknown
Rayless ragwort <i>Senecio aphanactis</i>	2	–	N	Y	N	Y	N	Outside of known range
Mount Hamilton jewelflower <i>Streptanthus callistus</i>	1B	–	Y	Y	N	Y	N	Several occurrences in study area in Henry Coe State Park (CNDDDB 2005); will not be affected by covered activities; endemic to Santa Clara County
California seablite <i>Suaeda californica</i>	1B	FE	N	Y	N	Y	N	Outside of known range; suitable habitat is tidal salt marsh
Saline clover <i>Trifolium hydrophilum</i> [ <i>T. depauperatum</i> var. <i>hydrophilum</i> ]	1B	–	N	Y	N	Y	N	Occurs in Soap Lake in San Benito County
Common viburnum <i>Viburnum ellipticum</i>	2	–	Y	N	N?	N	N	Species is fairly common in Pacific Northwest and unlikely to be listed. There is one unverified occurrence on Little Uvas Road in Morgan Hill. No CNDDDB (2006) occurrences within the study area. Species not likely to be adversely affected by covered activities.
California hoptree <i>Ptelea crenulata</i>	–	–	Y	N	N	N	N	Study area encompasses the southern end of this locally rare species' range limit in the Coast Range. Species is highly unlikely to be listed during the permit term and is unlikely to be adversely affected by covered activities. Additionally, very little data exists for this species that would allow an assessment of impacts or creation of conservation measures.
Santa Clara thorn-mint <i>Acanthomintha lanceolata</i>	4	–	Y	N	N?	N	N	Species does not meet the criteria for status or data: it is unlikely to become listed during the permit term and insufficient data exists at this time to evaluate impacts to or develop conservation measures for this species. Plan Conservation Actions may benefit this species incidentally.

	State/ CNPS	Federal	Range	Status	Impact	Data	Covered Status <sup>c</sup>	
Notes				<sup>b</sup>	<b>Criteria</b>			
a	<b>Status</b>			<b>Range:</b> The species is known to occur or is likely to occur within the Habitat Plan study area, based on credible evidence, or the species is not currently known in the study area but is expected in the study area during the permit term (e.g., through range expansion or reintroduction to historic range).				
	<b>State Status</b>			<b>Status:</b> The species is either:				
	FP	=	Fully Protected.	▪ listed under the federal ESA as threatened or endangered, or proposed for listing;				
	SE	=	State listed as endangered.	▪ listed under CESA as threatened or endangered or a candidate for such listing, or listed under the Native Plant Protection Act as rare; or				
	ST	=	State listed as threatened.	▪ expected to be listed under ESA or CESA within the permit term. Potential for listing during the permit term is based on current listing status, consultation with experts and Wildlife Agency staff, evaluation of species population trends and threats, and best professional judgment.				
	SR	=	State listed as rare.	<b>Impact:</b> The species or its habitat would be adversely affected by covered activities or projects that may result in take of the species.				
	CSC	=	California special concern species (July 2005 list).	<b>Data:</b> Sufficient data exist on the species' life history, habitat requirements, and occurrence in the study area to adequately evaluate impacts on the species and to develop conservation measures to mitigate these impacts to levels specified by regulatory standards.				
	<b>Federal Status</b>			Species proposed for coverage in the Plan were limited to those species for which impacts from covered activities were likely, in order to provide take authorization for the highest priority species. However, many other special-status species are expected to benefit from the Plan, as described in Chapter 5.				
	BGPA	=	Bald Eagle and Golden Eagle Protection Act.	<b>Recommended Covered Status</b>				
	MBTA	=	Migratory Bird Treaty Act.	Y recommended as covered species in the Habitat Plan.				
	FE	=	Federally endangered.	N not recommended for coverage in the Habitat Plan.				
	FT	=	Federally threatened.					
	FC	=	Candidate for federal listing.					
	FPT	=	Federally proposed for threatened listing.					
	FPD	=	Federally proposed for delisting.					
	FD	=	Federally delisted.					
	SOC	=	Species of Concern (National Marine Fisheries Service designation).					
	<b>California Native Plant Society Ranking</b>			<sup>c</sup>				
	1A	=	Presumed extinct in California.					
	1B	=	Rare or endangered in California and elsewhere.					
	2	=	Rare or endangered in California, more common elsewhere.					
	3	=	Plants about which more information is needed.					
	4	=	Plants of limited distribution

## **Species Accounts**

## Bay Checkerspot Butterfly (*Euphydryas editha bayensis*)

### Legal Status

**State:** None

**Federal:** Threatened (U.S. Fish and Wildlife Service 1987)

**Critical Habitat:** Designated (U.S. Fish and Wildlife Service 2008)

**Recovery Planning:** Recovery plan approved (U.S. Fish and Wildlife Service 1998)

© Alan Launer

### General Notes

The Bay checkerspot butterfly is one of the most-studied invertebrate taxa in the world. Starting in 1960, Dr. Paul Ehrlich, his research group at Stanford University, and numerous academic graduates or associates of the Stanford group have studied *Euphydryas* butterflies across western North America. Given its distribution in areas near Stanford, and historic presence on campus, the Bay checkerspot butterfly is the most studied of the *Euphydryas* subspecies. This butterfly has been the subject of many hundreds of articles published in peer-reviewed journals, chapters of academic books, more than a dozen doctoral dissertations and master's theses, and many field projects. Much of the accumulated knowledge, along with many of the key references, can be found in the book *On the Wings of Checkerspots: A Model System for Population Biology* (Ehrlich and Hanski 2004).

### Taxonomy

The Bay checkerspot butterfly is a subspecies of the widespread Edith's checkerspot butterfly (*Euphydryas editha*). This species, a member of the family Nymphalidae, is found across much of western North America, from northern Mexico to southern Canada and from the Pacific coast to Wyoming (White and Singer 1974). Subspecies of Edith's checkerspot butterfly are generally distinguished on the basis of differences in phenotype and primary larval host plant. Phenology tends to be closely associated with larval host plant and local environment and also varies among subspecies (Singer and Parmesan 1993; Singer et al. 1993). Most genetic analyses have supported the traditional groupings of populations into subspecies. Depending on the reference, there are more than 30 accepted subspecies of Edith's checkerspot butterfly, including approximately 12 subspecies from California.

The Bay checkerspot butterfly is distinct from Luesther's checkerspot butterfly (*Euphydryas editha luestherae*), a subspecies that feeds on lousewort (*Pedicularis* sp.) and perennial paintbrushes (*Castilleja* spp.) (Murphy and Ehrlich 1980). Luesther's checkerspot butterfly is often found in chaparral in close proximity to Bay checkerspot butterfly populations. The Bay checkerspot butterfly is very similar in appearance to an unnamed form of *E. editha* that also feeds on plantain (*Plantago* sp.) and annual paintbrushes (*Castilleja* spp.), which is found in areas south of the range of the Bay checkerspot butterfly.

Edith's checkerspot butterfly is occasionally placed within the genus *Occidryas* and it has been suggested that the proper name of the Bay checkerspot butterfly is *E. editha editha*. Neither the generic name *Occidryas* nor the reassignment to *E. editha editha* are presently accepted in the scientific community.

## Distribution

### General

The Bay checkerspot butterfly is known from the southern and eastern portion of the greater San Francisco Bay area. Populations, most of which have been extirpated, were known from San Francisco (Twin Peaks and Mount Davidson), San Mateo County (San Bruno Mountain south to Woodside), Santa Clara County (numerous locations), Alameda County (Oakland hills), and Contra Costa County (Franklin Canyon and Morgan Territory). The subspecies is not known from areas north of San Francisco Bay. To the south, starting in San Benito County, an unnamed form of Edith's checkerspot butterfly replaces the Bay checkerspot butterfly in the area's serpentine grasslands.

Within this limited geographic region, butterfly populations are patchily distributed in serpentine grasslands. It is unclear whether the Bay checkerspot butterfly was more widely distributed within the region prior to the major changes in composition and distribution of plant species associated with the European colonization of the area (Ehrlich and Murphy 1987).

As of 2005, all populations of the Bay checkerspot butterfly on the San Francisco Peninsula were extirpated, including all populations in San Francisco, San Mateo, and northern Santa Clara counties. Bay checkerspot butterflies were reintroduced to Edgewood County Park and Natural Preserve in April 2007. In the East Bay, the Bay checkerspot butterfly has been extirpated from most of its range, but may still exist in Contra Costa County in the general vicinity of Mt. Diablo. Unfortunately, records from Contra Costa County are often confounded by the presence of the relatively common Luesther's checkerspot butterfly. In south-central Santa Clara County, the Bay checkerspot butterfly is still abundant at multiple locations. Most butterflies are found along the ridge that forms the eastern boundary of the Coyote and southern Santa Clara valleys. This ridge consists of extensive serpentine grasslands, and extends from the Silver Creek Hills, through the Edenvale Hills (sometimes called the East Hills or Coyote Hills), to Pigeon Point just north of Anderson Reservoir Dam. There are multiple

populations of the butterfly along this ridge. There are smaller, scattered populations of the butterfly along the eastern foothills south of the Anderson Reservoir dam and along the western foothills of the Coyote Valley.

Factors implicated in these multiple extinctions on the Peninsula and in the East Bay include direct habitat loss through development, habitat degradation due to non-native species (likely exacerbated by nitrogen-containing pollutants), successional changes from grasslands to scrub and chaparral, periods of unfavorable or highly variable weather, and disruption of regional metapopulation dynamics. The detrimental impacts of these factors are more problematic for the butterflies because the extent of the serpentine grasslands of the Peninsula and East Bay is limited.

## Occurrences within the Study Area

The majority of habitat of the Bay checkerspot butterfly and the vast majority of individuals of the subspecies are found in the area covered by this HCP/NCCP.

### Historical

Bay checkerspot butterflies have been studied in central Santa Clara County since the 1960s and extensive work on the butterfly was conducted in the region during the 1980s and 1990s. Populations located in the Silver Creek Hills, Tulare Hill, and near Coyote Reservoir were study sites for many research projects in the 1960s and 1970s. In the 1980s, research on the butterfly shifted to the large concentration of butterflies present in the hills adjacent to the Kirby Canyon Sanitary Landfill.

Population declines and expansions are well documented for this subspecies, and are very common in this region. No extinctions of populations have been conclusively confirmed (a difficult task requiring multiple years of monitoring) in the area, but at various times populations located in the Silver Creek Hills, Tulare Hill, and the serpentine grasslands located near Kalana Avenue have declined to extinction or near-extinction. It is unclear if the records of isolated butterflies from Communication Hill, the hills south of Anderson Reservoir dam, and the hills west of Highland Avenue (San Martin) represent now-extirpated populations or merely transient butterflies.

Additionally, broad expansions and contractions of populations across slope exposures are common. Warm slopes (generally low elevation, and west- or south-facing) in particular often support high densities of butterflies in seasons following years with ample winter and spring rain. In seasons following drought years, few if any butterflies can be found on the warm slopes.

## Recent

As of 2005 Bay checkerspot butterflies were abundant in the multiple populations found along the eastern foothills, from the Silver Creek Hills to Pigeon Point. Several of these populations regularly support more than 250,000 adult butterflies. In areas south of Pigeon Point, Bay checkerspot butterflies are present in the small patches of grassland just west of Coyote Reservoir. On the west side of the Coyote Valley, Bay checkerspot butterflies have been present in the recent past in serpentine grasslands adjacent to Hale Avenue, in areas adjacent to Kalana Avenue, in the southern portions of the Santa Teresa Hills, in the hills near Calero Reservoir, and on Tulare Hill. Survey effort in this part of the study area is uncertain, though it is believed that these sites do not consistently support this species, due to lack of beneficial management. See *Population Trends 1985–2008*, below, for site specific population information.

## Natural History

### Habitat Requirements

At the present time, the Bay checkerspot butterfly reproduces only in serpentine grasslands. These native species-dominated grasslands support the larval host plants, dwarf plantain (*Plantago erecta*) and purple owl's clover (*Castilleja exserta* and/or *Castilleja purpurescens*), at densities that are high enough to sustain butterfly larvae. These host plants are not serpentine-dependent species and are distributed more widely outside of the study area. Within the study area these nutrient-poor serpentine habitats likely allow these host plants to compete with other non-native grassland species that would typically out-compete them. These grasslands also tend to support many additional species that can provide nectar to the adult butterflies.

Topography is an additional factor determining habitat quality and a variety of microclimates are needed for Bay Checkerspot butterflies to persist (Singer and Ehrlich 1979; Fleishman et al. 2000). Relatively cool and moderate microclimates are critical to a butterfly population's ability to survive drought (Weiss and Murphy 1983) while warm slopes appear to be important during wet/cool years (Weiss et al. 1988). Sites lacking cool and moderate slope exposures are unable to continuously support populations of Bay checkerspot butterflies.

Patch size and proximity to other sites supporting butterflies are also factors in determining suitability of particular serpentine grasslands for Bay checkerspot butterfly populations. In general, as patch size drops below several hectares it becomes increasingly unlikely that the grassland can support a viable population. However, given the dispersal capabilities of the butterfly, small patches of serpentine grassland located a few hundred meters from groups of other small

patches can support butterflies. Additionally, many relative small patches of serpentine grassland located within several kilometers of the region's large checkerspot butterfly populations are frequently occupied.

Weather is an important determinant of habitat quality (Dobkin et al. 1987; Hellmann 2002). Growing season rainfall, which delays senescence of larval host plants, is favorable for the butterfly. During periods of favorable weather, Bay checkerspot butterfly populations expand in extent and abundance. During these periods, grasslands generally considered too warm, too small, or too distant can be occupied by the butterfly.

Conversely, during periods in which there is relatively little growing season rainfall, the larval host plants senesce earlier in the year, and larvae in many locations cannot obtain sufficient food. This results in extensive contractions of the large populations as the distribution of butterflies shifts to cooler microclimates (Weiss et al. 1988). Many of the smaller and flatter patches of serpentine grassland tend to lose butterflies during these periods.

**Table 1.** Habitat Associations for the Bay Checkerspot Butterfly

Land Cover Type	Use by the Butterfly	Habitat Designation	Habitat Characteristics	Explanation
Serpentine grassland	Reproduction, growth, feeding—larvae and adult	Primary	Native bunch grasses; high species richness of native forbs; dwarf plantain ( <i>Plantago erecta</i> ); owl's clover ( <i>Castilleja exserta</i> , <i>C. purpurascens</i> )	Dwarf plantain is the primary larval food plant. Two species of owl's clover are utilized as secondary larval food plants when available. Adults feed on nectar from a variety of native forbs, including species of <i>Mullia</i> , <i>Layia</i> , <i>Lomatium</i> , <i>Lasthenia</i> , <i>Linantus</i> , and <i>Allium</i> .

## Life History

Bay checkerspot butterflies are univoltine, and individuals typically have a maximum life span of only slightly longer than one year. During this year, individuals progress through six fairly distinct life history stages: egg, prediapause larva, diapause (larval dormancy), postdiapause larva, pupa, and adult.

Eggs generally are laid in masses of 50 to 200, typically on the base of the larval host plants (Labine 1968; Singer 1972). Egg masses are occasionally laid on other plants or substrate such as rocks or dirt. The primary larval host plant species is the annual dwarf plantain (*Plantago erecta*). Two annual species of owl's-clover (*Castilleja* sp.) and purple owl's-clover (*C. exserta* ssp. *exserta*) are also used as larval host plants (Hickman 1993).

The eggs hatch in approximately 10 days. Egg masses frequently disappear, apparently from predation by invertebrates or possibly vertebrates. Heavy rain or

hail can also cause significant loss of eggs. Desiccation causes egg mortality under laboratory conditions, but it is not clear if this is a significant problem under field conditions.

After hatching, prediapause larvae feed on their host plants for two to six weeks, until either the larvae are large enough to enter and survive diapause (fourth instar) or have depleted the available food supply. Mortality during this phase is thought to be the primary determinant of the following year's population size; if prediapause survival is high, the population size will increase, and if prediapause survival is low, the population size will decrease. Even in "good" years at least 80% of larvae die prior to diapause (Singer 1972; Fleishman et al. 1997) and larvae resulting from egg masses laid in the mid-to late part of the season have very little chance of surviving (Singer and Ehrlich 1979). Most mortality during this stage is due to lack of food. Predation and excessive precipitation can also result in larval mortality (Dobkin et al. 1987).

Food supply can prove inadequate if the larval host plants senesce early relative to the butterfly (White 1974). This is often the case in dry years and for larvae originating from egg masses laid relatively late in the season. Low density of host plants can also lead to local depletion of resources. In general, dwarf plantain is a more consistent host plant, with densities and standing biomass being less variable than the owl's-clover species (which in some years are virtually absent). Dwarf plantain individuals, however, are typically smaller and senesce earlier than individuals of owl's-clover. While there is certainly a limit to how far larvae can disperse, even first instar larvae will easily traverse several meters in search of suitable host plants, and most larvae shift among individual plants several times.

Newly hatched larvae sometimes group together and make small webs around portions of their host plant. Field studies indicate that the proportion of larvae that make webs is variable (Labine 1968).

As the end of the spring growing season approaches, the larval host plants senesce and many of the butterfly larvae enter a period of physiological dormancy known as diapause. Alternately, many larvae die of starvation trying to reach the appropriate size needed to survive diapause or die shortly after entering diapause due to insufficient amounts of stored resources. Larvae spend diapause under rocks, debris, or plant litter, or in cracks and crevices in the soil. Diapause lasts until larval host plants germinate during the onset of the rainy season in late autumn and early winter. Dwarf plantain tends to be the primary early season food source.

Postdiapause larvae spend the next several months feeding and basking in the sun, growing quickly from small fourth instar larvae to 4 cm long seventh instar larvae. Postdiapause larvae can disperse several tens of meters, and frequently do so in search of host plants, appropriate basking areas, or areas sheltered from inclement weather. Development of larvae in warm microclimates (defined primarily by slope, aspect, and elevation) is frequently several weeks ahead of larvae in cool microclimates. These phenological differences are present even

when the distance between the areas of different microclimates is quite small, on the order of ten meters.

After the larvae reach sufficient size and stage, they pupate. In most years, the majority of larvae pupate in February or March. Phenology is extremely weather dependent, and all of the major transitions in the butterfly's life cycle, including pupation, can be shifted several months. Pupae are formed in a loose web, typically at the base of vegetation or rocks. Individuals remain as pupae for three to five weeks, or longer if there are extended periods of cold and rain.

Some mortality occurs during the post-diapause and pupal stages; the magnitude varies from year to year (White 1986). Parasitoids are evident in post-diapause larvae and pupae, and a high percentage of late-developing larvae are typically parasitized. Parasitoids, however, do not appear to be a major factor in determining population size in the Bay checkerspot butterfly (parasitism is a controlling factor for populations of other species of checkerspot butterflies; Moore 1989). In some years a pathogen, which causes the darkening, liquefaction, and death of butterfly larvae, is present. Field studies have observed that pupae frequently disappear, and predation has long been presumed to be the cause. In general, approximately 50% of the late (at least early sixth instar) post-diapause larvae present at a given location will survive to become an adult butterfly.

After several weeks and when the weather warms, butterflies will eclose (emerge from pupae). Newly-emerged individuals crawl to a somewhat exposed location and sun themselves until their wings have fully hardened. Male butterflies tend to emerge earlier in the season than females (Ehrlich 1965), and are on average smaller than females. Individual butterflies survive as adults for seven days to two weeks. How long adult butterflies are present in a given location depends on the number of butterflies (the more butterflies, the more prolonged the adult season), topographic diversity of the site (the more diversity, the more microclimates), and weather (Hellmann et al. 2003). The adult flight season is typically about four to six weeks in length, generally starts in March, and terminates in late April to early May. Actual starting and ending times can vary by several weeks from year to year.

The majority of female butterflies are mated soon after eclosion, occasionally before their wings have hardened fully. There is some hilltopping in the Bay checkerspot butterfly (i.e., congregation for mating at visible landmarks, often hilltops, that may have few larval or adult resources), with males in particular tending to concentrate local ridges (Ehrlich and Wheye 1986). Most female Bay checkerspot butterflies mate only once and are prevented from subsequent mating by a waxy plug deposited by the male (Labine 1964). Females lay multiple egg masses; earlier egg masses contain a greater number of eggs than later egg masses. Nectar is utilized by both male and female butterflies, and is provided by a variety of plant species, including common muilla (*Mullia maritima*), tidytops (*Layia platyglossa*), California goldfields (*Lasthenia californica*), lomatiums (*Lomatium* sp.), onions (*Allium* sp.), and several linanthus species (*Linanthus* sp.).

Rain and hail can cause substantial mortality of adult Bay checkerspot butterflies. Strong wind can also be problematic for the butterflies, often damaging their wings to the point that their ability to fly is compromised. Bay checkerspot butterfly adults are also eaten by a variety of predators. Spiders catch butterflies both in their webs and while the butterflies are not flying (Ehrlich 1965). Other invertebrates undoubtedly prey on some butterflies while the butterflies are on the ground or in the vegetation. Mammals may take some butterflies, particularly during periods when the butterflies are inactive (at night and during periods of bad weather). Birds take Bay checkerspot butterflies, but predation by birds is typically not high (Ehrlich 1965).

Although the Bay checkerspot butterfly is considered an annual univoltine species, it is possible that under some conditions, the butterfly can extend its life cycle for several years. Under laboratory conditions, individual butterflies frequently enter a second diapause (or even three or four diapauses). Given this observed ability, it is very possible that under some circumstances, post-diapause larvae occasionally re-enter diapause, thereby extending their life span from one to two years.

**Table 2.** Generalized Phenology of the Bay Checkerspot Butterfly

Pre-diapause larvae				✓	✓	✓	
Diapausing larvae	✓				✓	✓	✓
Post-diapause larvae	✓	✓					
Pupae		✓	✓	✓			
Adults			✓	✓			

## Movement

Adult Bay checkerspot butterflies are relatively agile, and can easily fly several kilometers (Harrison 1989). Bay checkerspot butterflies have a general propensity to remain associated with serpentine grasslands, and most movements are within a single patch of serpentine grassland (Ehrlich et al. 1980; Ehrlich and Murphy 1981). Within a given patch, butterflies will frequently fly from one area to another, looking for potential mates, feeding on nectar on scattered groups of flowers, avoiding wind, avoiding other butterflies (mated females in particular tend to avoid males), and looking for oviposition sites. In smaller habitat patches, this means that individual butterflies often fly from one end of the patch to the other. In large habitat patches, those several kilometers in length or width, individual butterflies will generally stay in a portion of the overall site, usually moving much less than a kilometer from the point where they eclosed.

In areas where serpentine grasslands transition into other types of plant communities, Bay checkerspot butterflies will usually turn around and remain in the serpentine grassland (Ehrlich 1965). Butterflies that do not turn around at the edge of their serpentine habitat tend to keep flying—presumably until another patch of habitat is encountered. It is assumed that butterflies may use any land cover type as a movement corridor if the land cover is adjacent to serpentine grassland. Harrison (1989) documented colonization up to 2.8 miles from Coyote Ride, and one individual moved 3.5 miles. Another marked individual was documented to have flown 4.7 miles (U.S. Fish and Wildlife Service 1998). Based on numerous mark-recapture studies, the percentage of individuals that leave particular serpentine grassland areas is thought to be generally low, less than 10%. This percentage apparently increases as the season progresses, and may be higher in populations with very low densities of Bay checkerspot butterflies.

Even with the fairly low percentage of butterflies that leave specific sites, if the butterfly population is large (several of the Bay checkerspot butterfly populations in the HCP/NCCP study area frequently consist of 250,000+ adult butterflies), a large number of Bay checkerspot butterflies will disperse away from their natal habitat patch. For example, if a population includes 250,000 adult butterflies and 1% of the population leaves the site, then 2,500 individual butterflies are expected to leave the site. Given the patchiness of serpentine grasslands and the apparently limited ability of Bay checkerspot butterflies to locate these grasslands from more than a few hundreds of meters distant, most Bay checkerspot butterflies that leave serpentine grasslands do not find other patches of habitat. However, patches of serpentine grassland that are within a few kilometers of moderate to large populations of Bay checkerspot butterflies will receive immigrants on a regular basis; larger patches of serpentine grassland will receive more immigrants, but even very small patches will occasionally be occupied by Bay checkerspot butterflies if the patches are within five to 10 kilometers of the large populations. Conversely, as distance between patches increases, the chance of butterflies migrating between the two patches decreases.

Prediapause larvae generally do not disperse far from where they hatched, but undoubtedly some individuals disperse distances in excess of 10 meters (Launer pers. comm.). Postdiapause larvae are more prone to disperse, but it is unlikely that many move farther than 50 meters from their place of diapause (Launer pers. comm.).

**Table 3.** Movement Distances for Bay Checkerspot Butterfly

Type	Distance	Notes	Sources
Adults—within habitat	Depend on size of habitat patch	Generally stay associated with patch of serpentine grassland	Harrison 1989
Adults—out of habitat	Up to several kilometers	Out of habitat movement tends to be random and linear; ridges are occasionally followed	Harrison 1989
Prediapause	Generally fewer than 10 meters		Harrison 1989
Postdiapause	Generally fewer than 50 meters	Larvae tend to move toward warmer microclimates (often uphill)	Harrison 1989

## Ecological Relationships and Population Dynamics

Regional population dynamics of the Bay checkerspot butterfly tend to be complex. The abundance of individual populations increases or decreases in response to site-specific characteristics (topography, patch size, management regime, etc.) and weather. Likewise, in expansive patches of serpentine grassland, particularly those with considerable topographic diversity, shifts in butterfly density across the landscape are common. Most of these shifts in density across the landscape are expansions and contractions, with the butterfly population shifting from cool and moderate microclimates during dry years, to warmer microclimates during rainy years, and then back to the cool and moderate microclimates during the next drought (Weiss et al. 1988).

Local extinctions of entire populations and of segments of large populations are not uncommon. Reestablishment of populations in areas formerly supporting distinct populations or the spatial expansion of extant populations are also not uncommon. This loose pattern of extinctions, colonizations, contractions, expansions, has led many to characterize the Bay checkerspot butterfly as a series of metapopulations.

The classical concept of a metapopulation (Levins 1969, 1970), a series of ephemeral local populations linked by dispersal, does not apply to the Bay checkerspot butterfly. A better description of the population dynamics of this species is a source-sink metapopulation (Harrison et al. 1988; Hanski 1994). The expansive populations occupying the serpentine grasslands found in the hills along the eastern edge of the Coyote Valley (variously known as the southern Silver Creek Hills, the Edenvale Hills, the East Hills, and the Coyote Hills) are large and microclimatically diverse enough that if properly managed, they may be essentially “extinction proof” (i.e., a perennial “source” population), barring any dramatic shifts in climate, land use, or habitat management. The many smaller and less diverse sites to the west and south are much more susceptible to periods of unfavorable weather, and hence more extinction prone (i.e., “sink” populations). The large populations in the eastern hills are the source of

butterflies, providing butterflies that either supplement the small populations to the west or that actually reestablish populations that have been extirpated.

There have been substantial changes in plant composition and distribution since European colonization. As a result, regional population dynamics of the Bay checkerspot butterfly may be quite different than historically.

The main factor contributing to a butterfly population's decrease or increase is the availability of edible host plants for the prediapause larvae. Host plant availability is determined by two factors, biomass of the host plants and their phenology (relative to the butterflies). Plant biomass in turn is determined by weather, number of viable seeds, seed germination, seedling growth and survival, and land management (e.g., livestock grazing, competition from alien species, etc.). There is considerable annual variation in biomass of the larval host plants. The annual owl's-clover species, in particular, vary greatly spatially and temporally, and are virtually absent in some years.

The second principal factor contributing to availability of larval host plants is phenology (i.e., the timing of development, or more precisely, the relative timing of the butterfly larval development and the developmental timing of their host plants. If many of individual plants do not senesce until mid-May, as is the case when there is at least some precipitation during the early spring growing season, then the butterfly larvae should be able to find sufficient quantities of edible food. If the rains stop early in the growing season, the majority of the plants may senesce early and the majority of the butterfly larvae will have trouble finding enough food to survive.

## Population Status and Trends

**Global:** Declining

**State:** Declining

**Within Study Area:** Declining

## Threats

The Bay checkerspot butterfly is in a precarious situation, but it is not threatened with immediate extinction. There are many threats acting on the butterfly and the serpentine grasslands upon which it depends. These threats include:

**Habitat loss via development.** Many Bay checkerspot butterfly populations have been lost due to conversion of serpentine grasslands to residential, recreational, and commercial development.

**Habitat modification via development.** A number of serpentine grasslands have been partially destroyed by urban and suburban development, either directly (e.g., quarries, dumps, roads) or indirectly by adjacent land use. Water, either irrigation or runoff, from built environments can significantly alter the species

composition of plants on a site, potentially rendering portions of a site unsuitable for Bay checkerspot butterflies.

**Non-native species.** Although serpentine grasslands are typically more resistant to invasion by non-native species than many other vegetation types, non-native species eventually degrade serpentine grasslands. Habitat management is an absolute necessity to control this threat.

**Pollution.** A number of pollutants, especially nitrogen-based pollutants, threaten the Bay checkerspot butterfly. Deposition of nitrogen on serpentine grasslands can radically alter the plant composition. Deposition of nitrogen acts to fertilize the nutrient-poor serpentine soil, and greatly exacerbates the problems caused by non-native species (Weiss 1999).

**Succession.** Given the present species composition, rates and types of disturbance, and pollutants, it appears that areas of serpentine grassland that have been recently disturbed, either by grazing or fire, are better able to support Bay checkerspot butterflies than areas that have not been recently disturbed (Weiss 1999). This probably reflects that grazing and fire tend to reduce the dominance of non-native species. It is not clear what the successional patterns were in prior to European colonization and whether Bay checkerspot butterflies were associated with any particular successional stage.

**Over-collecting/poaching.** Although mentioned by various agencies as being a general threat to rare butterflies, there is no evidence suggesting that the current level of illegal collecting that undoubtedly occurs is of any consequence to Bay checkerspot butterfly persistence. In fact, artificial application of heavy “predation pressure” in the form of intensive collecting was applied to the Jasper Ridge colony in 1964 and 1965, with very little reduction in population size (Ehrlich 1965).

**Overstudy.** Many populations of the Bay checkerspot butterfly have been studied, often quite invasively, since 1960. Several of the most intensely studied populations have gone extinct, most notably those located at Jasper Ridge on Stanford and at Edgewood County Park in San Mateo County. None of the studies designed specifically to examine the potential impacts of research on Bay checkerspot butterfly populations have identified any significant negative impacts (Harrison et al. 1991; Hellmann et al. 2003). Harrison et al. (1991) did indicate that collections may have increased the chances of extinction, with an effect ranging from negligible to a 15% increase in extinction probability over 30 years depending on model assumptions.

**Weather.** Both current weather and potential future changes in weather can impact the Bay checkerspot butterfly. Periods of drought and deluge both have the potential to negatively impact Bay checkerspot butterflies (Singer 1972; Hellmann 2002c). Drought tends to cause Bay checkerspot butterfly populations to retreat to areas with moderate to cool microclimates. If these microclimates are present at a site, then the population merely experiences a contraction in distribution and abundance. If a site does not have sufficient areas of moderate and cool microclimates, then extirpation of the population is a definite

possibility. The impacts of excessively wet years are somewhat more difficult to quantify. Some shifts in microclimatic zone utilized by the butterfly may occur; the very cool microclimates may simply become too wet to successfully sustain butterflies. Other negative impacts of above-average precipitation include increased competition between the native forbs and mostly non-native grasses and, possibly, increased butterfly mortality due to pathogens. Extremes in annual variation of weather may also negatively impact Bay checkerspot butterfly populations.

Predicting future climate changes and the impacts of these changes on biotic systems is a highly inexact science. However, given the sensitivity of butterfly populations to host plant phenology, it is reasonable to assume that future climate change could significantly impact Bay checkerspot butterfly populations (Dennis 1993; Hellmann 2000, 2002).

**Vegetation management.** Both overgrazing and undergrazing have been identified as threats to this species (U.S. Fish and Wildlife Service 2009). Grazing is used to reduce standing biomass of nonnative vegetation and increase the prevalence of native forbs, including Bay checkerspot butterfly's larval host plant. As such, grazing regimes should be monitored to ensure that species habitat is not degraded.

**Gopher control.** It has been observed that Bay checkerspot butterfly's larval host plants stay green and edible longer when located on or near soils recently tilled by gophers. This increases the availability of larval host plants into the dry season and may allow more larvae to reach diapause. Gopher control could decrease the availability of these tilled soils and result in the reduction of larval host plant availability (U.S. Fish and Wildlife Service 2009).

## Data Characterization

The Bay checkerspot butterfly is one of the most studied invertebrate taxon in the world. Starting in 1960, Dr. Paul Ehrlich, his research group at Stanford University, and numerous academic affiliates of the Stanford group have studied *Euphydryas* butterflies across western North America. Given its distribution in areas near Stanford, and indeed the former presence of three populations of the butterfly on campus, the Bay checkerspot butterfly is the most studied of the *Euphydryas* species and subspecies. This butterfly has been the subject of many hundreds of articles published in peer-reviewed journals, multiple chapters of academic books, more than a dozen doctoral and master's dissertations, and many field projects. Much of the accumulated knowledge, along with many of the key references can be found in the book *On the Wings of Checkerspots: A Model System for Population Biology* (Ehrlich and Hanski 2004).

## Population Trends 1985–2008

Long term monitoring sites have been established along Coyote Ridge. Annual estimates of larval population size are the essential component of long-term monitoring of the Bay checkerspot butterfly. The distribution and abundance of the butterfly has been monitored at Kirby Canyon (KC) since 1985, and across most of the core populations since the 1990s. This period included a record 5-year drought (1987–1991), a strong El Nino in 1998, and other wide swings in weather.

This summary includes data for several core areas, and a discussion of broad features of the observed population dynamics that are highly relevant to conservation planning. These features include the range of population fluctuations, synchrony or asynchrony across Coyote Ridge, and responses to exceptional weather events. Also, notable population crashes in response to lack of grazing are also discussed.

## Methods

Larvae are counted in a stratified sampling design developed at Kirby Canyon in the mid-1980s (Murphy and Weiss 1988). The habitat is stratified by March 21 solar radiation (insolation) into 5 “thermal strata;” Very Warm, Warm, Moderate, Cool, and Very Cool. Within each stratum, multiple samples of larval densities are taken over 1,500–3,000 m<sup>2</sup> areas using a timed search technique (10 person-minutes) that can be converted to absolute densities (Weiss 1996). The map of the Kirby Butterfly Trust Leasehold (Figure 3) with Thermal strata and larval sample areas shows the sample sites that have been visited in recent years. 35–40 sites are sampled within the 100 hectare leasehold each year in a window from January through March, the exact dates being weather dependent. The thermal stratification scheme is shown in color—red corresponds to Very Warm, yellow Warm, green Moderate, cyan Cool, and dark blue Very Cool. Larval sample areas are the white polygons.

Larval surveys were extended to most of Coyote Ridge in the 1990s (Weiss 1996). More than 200 sites are visited in a typical year across Coyote Ridge as a whole. Surveys were stratified by “population zones” —habitat blocks 500 or more meters across, corresponding to local topography and grazing regimes (Figure 3). These surveys monitor the health of the overall population on Coyote Ridge, and are a foundation for conservation. These surveys track local and regional population dynamics, and are now supported by a variety of mitigation sources.

## Results

### Population Trends at Kirby Canyon 1985–2008

Since 1985, larval abundance at KC ranged from 25,000 to 800,000 (Figure 4a). From 1985 to 1987, numbers increased from 100,000 to nearly 900,000, followed by a four-year crash down to 30,000. A one year increase in 1992 to 100,000 was followed by several years of relative stability. A sharp decrease in 1997 to 25,000 was followed by a 7-year increase to 500,000+ by 2004, followed by a sharp three year decline to 50,000 by 2007 and 2008.

The 1987–1991 population declines correspond to a multi-year drought, and the particularly sharp decline in 1989 followed a truncated rainy season with a warm March–April. The decline in 1997 followed a record warm, but cloudy/rainy winter. The decline in 2005 followed a warm, dry March–April.

An additional drive of population response was also noted in 2004–2005. On many moderate and cool slopes, larval population densities were high enough ( $>1$  larva/m<sup>2</sup>) in successive years that local defoliation of *Plantago* occurred, and sharp drops to  $<0.05$  larvae/m<sup>2</sup> were observed the following year. The combination of the warm-dry spring 2004 and defoliation exacerbated the population declines.

### Population Dynamics across Coyote Ridge 1992–2008

Larval population estimates in the other population zones show large fluctuations (Figures 4b–4g). The ridgetop areas just north of KC (VTA High 1 and VTA High 2, new names) showed relative stability from 1992 to 1996, sharp declines in 1997, increases through 2004, and subsequent declines through 2007 and 2007. Note that abundance in these areas, especially VTA High1, dropped to near 1000 from peaks of 100,000. These fluctuations were largely synchronous with those at KC.

On the lower slopes of the VTA parcel (VTA low), abundance peaked at 70,000 in 1994, and dropped below detection limits from 1998 to 2000. During this time, some adult butterflies were observed in this area each year, indicating persistence. Larval abundance recovered to 70,000 again by 2003, probably enhanced by immigration from large populations on the ridgetop, and fell to 10,000 by 2006–2008.

Although sampled more intermittently, the data indicate that the southern parts of the UTC property also experienced similar fluctuations. R2A (south of the fence dividing the winter-spring grazing from the spring/summer/fall grazing) peaked in 2003 and 2004, and UTC South (north of the fence) peaked a couple years later in 2006.

Sampling has been even more intermittent in UTC North (numbers not shown) but in 2008, local densities there were among the highest seen on Coyote Ridge.

Areas between UTC South and UTC North have maintained occupancy by Bay checkerspot butterfly, tended to follow the broader trends, but not enough survey sites have been done to estimate total population size.

Larval densities at lower elevations north of the VTA property, including the Los Esteros and Silicon Valley Power 40-acre mitigation parcels, have historically been lower than on the ridgetop. Larval populations in these areas have been estimated to be several hundred to several thousands. In recent years, population trends have tracked the lower slopes of VTA.

The habitat north of Metcalf Canyon (Metcalf, 114 ha included in the population estimate) has historically supported a large population of Bay checkerspot butterflies (Figure 2). Larval numbers increased from 27,000 in 1997 to 200,000 in 2000, to >400,000 in 2001, 800,000 in 2004, and then declined sharply to 83,000 in 2005, and 20,000 in 2007 followed by an increase to 35,000 in 2008.

The adjacent habitat to the northeast (Metcalf North Ridge, or San Felipe) has supported butterflies since 1997, but no quantitative estimates have been made of total numbers.

At the SE end of Coyote Ridge, the serpentine grasslands on Pigeon Point just NW of Anderson Dam has supported moderate to low densities of larvae during intermittent surveys since 1985.

Overall the subpopulations on Coyote Ridge exhibited relative stability from 1992 to 1996, a sharp decline in 1997, increases by an order of magnitude from 1997 through 2004, and subsequent declines by an order of magnitude or more through 2007 and 2008. Fluctuations were largely in synchrony with each other, but asynchronous population responses were noted at some sites in some years. Peak numbers of Bay checkerspot larvae in 2004 across all of Coyote Ridge were on the order of 2,000,000, and the 2008 estimate is on the order of 150,000 larvae.

## Silver Creek Hills

The Environmental Trust of the Ranch at Silver Creek has been responsible for managing the conserved habitat in the Silver Creek Hills. Much of this area was heavily degraded by lack of grazing from 1992 through 1995 (Silver Creek Valley Country Club side) and from 1992 through 2002 on the Ranch at Silver Creek side. Populations are extant in the hundreds. Documentation is provided by Wetland Research Associates who manage the Environmental Trust.

## Tulare Hill

In 2002, there were an estimated 2–3,000 larvae on Tulare Hill, but in 2003 the numbers dropped into the low hundreds, and the population declined to fewer than 100 by 2005. The northern 2/3 of Tulare Hill was ungrazed starting in 2001,
