VERDI v2.0 Beta Released

The Visualization Environment for Rich Data Interpretation (VERDI) is a Java-based visual analysis tool for evaluating and plotting multivariate gridded results from air quality and meteorological models. This new release supports visualizing data on the variable mesh of the MPAS-A model.

- [Learn](#) more about VERDI, including download instructions and documentation, by visiting the CMAS Center website. **EXIT**

CMAQ (*see-mak*): an active open-source development project of the U.S. EPA that consists of a suite of programs for conducting air quality model simulations. CMAQ combines current knowledge in atmospheric science and air quality modeling, multi-processor computing techniques, and an open-source framework to deliver fast, technically sound estimates of ozone, particulates, toxics and acid deposition.
